rocky decline, and with its walls and castles has from a distance an imposing appearance. The cathedral was founded in 1090 by Julia de Hauteville, daughter of Roger I., who had presented her with the lordship of Sciacca on her marriage with Perollo; and two other churches, S. Salvatore and S. Maria delle Giummare, date from the same period. In the cliffs are excavated granaries in which under the Spanish viceroys the grain used to be stored under Government control. To the east of the town, at the foot of Monte S. Calogero, are the hot wells (sulphurous and saline) of Sciacca; and the steam that breaks forth from the top of the hill seems to have been used (as it still is) for vapour baths from a remote (possibly Phœnician) period. The population was 21,451 (22,195 including Marina) in 1881.

Sciacca was the birthplace of Tommaso Fazello (1498-1570), the historian of Sicily. In the 16th century it was the scene of a terrible feud between the Perollos (lords of Sciacca) and the counts of Luna.

SCIATICA. See NEURALGIA, vol. xvii. p. 364.

SCILLY ISLES, a group of islands, about forty in number, in the county of Cornwall (see vol. vi. plate IX.), England, are situated about 25 miles west by south of Land's End and 40 west from Lizard Point, in 50° N. lat. and 6° W. long. They are composed wholly of granite,—outliers of the granite highlands of Cornwall. There are some metalliferous veins or lodes, but none that could ever have yielded much iron. On account of the mild climate the vegetation is remarkably luxuriant. The mean average temperature in winter is about 45° and in summer about 58°. Fuchsias, geraniums, and myrtles attain an immense size, and aloes, cactus, and the prickly pear grow in the open air. The inhabitants devote their attention principally to the cultivation of early potatoes for the London market. Asparagus and other early vegetables, as well as flowers, are also largely cultivated. Lobsters are caught and sent to London, but the fishing industry is of comparatively minor importance.

The total area of the islands is 3560 acres, with a population in 1871 of 2090, and in 1881 of 2320, including 276 persons on board vessels. The inhabited islands are St Mary's (area about 1500 acres), Treco (700), St Martin's (550), St Agnes (350), and Bryher (300). The principal town, Hugh Town in St Mary's, occupies a sandy peninsula crowned by the height called the Garrison, with Star Castle, erected in the time of Elizabeth. It possesses a harbour and pier with a roadstead affording anchorage for large vessels. The coast-line is wild and picturesque, with precipitous headlands and many extensive caves. On Treco there are remains of an abbey; and St Agnes has a lighthouse 72 feet in height. On the islands there are numerous rude pillars and circles of stones, similar to those in Cornwall.

The Scilly Isles are probably the *Cassiterides* or "Tin Islands" of the Greeks (see vol. xviii. p. 806). The islands were granted in 936 by Athelstan to the monks settled at Treco, but on the endowment of the abbey of Tavistock the greater portion of them were included amongst its possessions. In the reign of Elizabeth they were divided amongst several proprietors. During the Civil War Hugh Town held out for the king, and in 1645 afforded shelter for a time to Prince Charles until he escaped to Jersey. In 1649 they were taken possession of by Sir John Grenville, a Royalist, who made use of them as a convenient shelter, whence he issued to sweep the neighbouring seas, until in 1651 he was forced to surrender to a fleet under Blake and Sir John Ayscue. In ancient times a frequent haunt of pirates, the islands were afterwards notorious for smuggling. On the suppression of smuggling Mr Augustus J. Smith did much to introduce order and encourage habits of industry amongst the inhabitants.

SCINDE. See SIND.

SCIO, the Italian name of an island on the west coast of Asia Minor, called by the Greeks Chios (ἡ Χίος, ἡ τῇ Χίῳ) and by the Turks Saki Adasi; the soft pronunciation of χ before ι in Modern Greek, approximating to sh, caused Χίῳ to be Italianized as Scio. Scio, which is about 30 miles long from north to south, and varies in breadth from 8 to 15 miles, is divided into a larger northern part and a smaller southern part, called respectively *apanomeria*

and *katomeria*. The island is rugged and well deserves the epithet "craggy" (*παιπαλόεσσα*) applied to it in the Homeric hymn. The southern part is less rocky than the northern, and the wealth of the island is concentrated there. The figs of Chios were noted in ancient times, but wine and gum mastic have always been its most important products. The climate is almost perfect, the atmosphere delightful and healthy; oranges, olives, and even palms grow freely. The finest wine was grown on the north-western coast, in the district called by Strabo Ariusia, and was known in Italy as *vinum Arvisium*. The population of Chios has always been far greater than its resources could feed; the people have therefore been forced to import the necessities of life in exchange for their wine and mastic and fruit, and alike in ancient and modern times they have been known as merchants and traders. Pottery of Chios and Thasos was exported to Illyria (Strab., p. 317) and doubtless elsewhere; it formed or contained the cargo of outward-bound trading ships. Thasian ware is familiar in museums, where the stamped handles of Thasian amphoræ have been collected in thousands; but no pottery has yet been identified as of Chian manufacture. An incidental proof of the importance of Chian handicrafts lies in the fact that early in the 7th century B.C. Glaucus of Chios discovered the process of soldering iron, and the iron stand of a large crater whose parts were all connected by this process was constructed by him, and preserved as one of the most interesting relics of antiquity at Delphi. The long line of Chian sculptors in marble, Bupalus and Athenis, sons of Archermus, son of Micciades, son of Melas, bears witness to the fame of Chian art in the period 660 to 540 B.C. The Winged Victory of Micciades and Archermus, which was dedicated at Delos, is still preserved,—the most important attested work extant of archaic Greek art. Marble quarries also were worked in the island. In literature the chief glory of Chios was the school of epic poets called Homeridæ, who carried on and gave an Ionic tone to the traditional art of the older Æolic bards. Cinæthus is said to have written the Homeric *Hymn to Apollo of Delos*, and is believed by some modern critics to have exercised great influence on the text of the *Iliad* and *Odyssey*. The Chian recension of these poems (*Χία Ἑκδοσις*) was in later times one of the standard texts. Ion the tragic poet, Theopompus the historian, and other writers maintained the position of Chios in literature during the classical period.

The chief city of Chios has always borne the same name as the island. It is situated near the middle of the eastern coast, and at the present day contains about 17,000 inhabitants. A theatre and a temple of Athena Polineus existed in the ancient city. About 6 miles north of the city there is a curious monument of antiquity, commonly called "the school of Homer"; it is a very ancient sanctuary of Cybele, with an altar and a figure of the goddess with her two lions, cut out of the native rock on the summit of a hill. On the west coast there is a monastery of great wealth with a church founded by Constantine I.X. (1042-54). Starting from the city and encompassing the island, one passes in succession the promontory Posidium; Cape Phanæ, the southern extremity of Chios, with a harbour and a temple of Apollo; Notium, probably the south-western point of the island; Laii, opposite the city of Chios, where the island is narrowest; the town Bolissus (now Volisso), the home of the Homerid poets; Melena, the north-western point; the wine-growing district Ariusia; Cardamyle (now Cardhamili); the north-eastern promontory was probably named Phlium, and the mountains that cross the northern part of the island Pelinæus or Pellenæus. The situation of the small towns Leuconium, Delphinium, Caucasæ, Cœla, and Polichne is uncertain; probably most of them were in the southern part. The island is subject to earthquakes; a very destructive shock occurred in March 1881.

The history of Chios is very obscure. According to Pherecydes, the original inhabitants were Leleges, while according to other accounts Thessalian Pelasgi possessed the island before it became an Ionian state. The name *Athalia*, common to Chios and Lemnos in very early time, suggests the original existence of a homogeneous population in these and other neighbouring islands. Cœnopium, a mythical hero, son of Dionysus or of Rhadamanthus, was an early king of Chios. His successor in the fourth generation, Hector,

united the island to the Ionian confederacy (Pausan., vii. 4), though Strabo (p. 633) implies an actual conquest by Ionian settlers. The name Hector and the fountain Helene (probably at the modern Thelena in the north) might be expected in the island of the Homeridæ. The regal government was at a later time exchanged for an oligarchy or a democracy, but nothing is known as to the manner and date of the change. As in most other states of Greece, tyrants sometimes ruled in Chios; the names of Amphichus and Polytecneus are mentioned. The early relations of Chios with other states are very obscure, but it seems to have been an ally of Miletus, and to have been at enmity with the Phocæo-Samian alliance, to which the neighbouring Erythræ belonged. The same form of the Ionian dialect was spoken in Chios and in Erythræ.

When the Persians appeared on the Ionian coast Chios willingly submitted, refused to their old enemies the Phocæans, who were fleeing from the Persian yoke, a refuge on their islands Cænussæ, and even surrendered the Lydian fugitive Pactyes in defiance of all religious scruples. Strattis, tyrant of Chios, followed Darius in his Scythian expedition. The Chians joined in the Ionian rebellion against the Persians (500-495) and supplied 100 ships. After the Persian victory at Lade the island was most severely treated, the towns and temples burned, and many of the people enslaved. At Salamis (480) the Chian ships, led by the tyrant Strattis, served in the Persian fleet. After the battle of Mycale (479) the island became free and a democratic government no doubt took the place of the tyranny. Chios was the most powerful state after Athens in the Delian confederacy, and it was an ally on equal terms of the Athenian empire, paying no tribute, but furnishing ships in case of war. It remained a faithful ally of the Athenians till the year 412, when, encouraged by the weakness caused in Athens by the Sicilian disasters, it joined the Lacedæmonians. Its fleet then consisted of fifty ships. The Athenians defeated them in three battles, at Bolissus, Phanæ, and Leuconium, but could not reconquer the island. Finding the Spartan hegemony more oppressive than the Athenian, Chios returned to the Athenian connexion in 394, but soon afterwards deserted and joined the Thebans. In the wars of Alexander the Great, Memnon, supported by the oligarchical party, held the island for the Persians. It was afterwards involved in the rapid vicissitudes of Ionian history, falling under the power of various dynasties among the *diadochi*. In the Mithradatic wars it favoured the Roman alliance, and the king's general Zenobius fined the island 2000 talents and carried off a great number of the population into slavery in Pontus. It had many centuries of peaceful prosperity under Roman and Byzantine rule. The Genoese held it from the 14th century till in 1566 the Turks conquered it and the third great Chian disaster and massacre occurred. Except for a brief Venetian occupation in 1694, Chios has remained in Turkish hands till the present day. A fourth massacre afflicted the island in 1822, when the Turks repressed with fire and sword the attempted Greek insurrection. Till this terrible event the island was ruled very leniently by the Turks; the internal government was left in the hands of five archons, three Greek and two Catholic, while two resident Turkish officials represented the sultan and received through the archons the stipulated tribute. (W. M. RA.)

SCIPIO. The Scipios,¹ a memorable name in Roman history, were a branch of the ancient and noble family of the Corneli. It was in Rome's wars with Carthage that they made themselves specially famous.

1. PUBLIUS CORNELIUS SCIPIO, the father of the Elder Africanus, was the first Roman general to encounter Hannibal in battle. He was consul in 218 B.C., the first year of the Second Punic War, and, having Spain for his province, he went with an army to Massilia (Marseilles) with the view of arresting the Carthaginian's advance on Italy. Failing, however, to meet his enemy, he hastened back by sea to Cisalpine Gaul, leaving his army under the command of his brother Cneius Scipio, who was to harass the Carthaginians in Spain and hinder them from supporting Hannibal. In a sharp cavalry engagement in the upper valley of the Po, on the Ticinus, he was defeated and severely wounded, and it is said he owed his life to the bravery of his son, then a mere stripling. Again, in the December of the same year, he witnessed the complete defeat of the Roman army on the Trebia, his colleague Sempronius having insisted on fighting contrary to his advice. But he still retained the confidence of the Roman people, since his term of command was extended, and we find him with his brother in Spain in the following year.

¹ The name means a "stick" or "staff."

winning victories over the Carthaginians and strengthening Rome's hold on that country, till 212 or 211. The details of these campaigns are not accurately known to us, but it would seem that the ultimate defeat and death of the Scipios were due to the desertion of the Celtiberi, bribed by Hasdrubal, Hannibal's brother.

2. PUBLIUS CORNELIUS SCIPIO AFRICANUS THE ELDER. — After having been present at the disastrous battles of the Ticinus, the Trebia, and Cannæ, and having after that last crushing defeat had the spirit to remonstrate with several Roman nobles who advocated giving up the struggle and quitting Italy in despair, Scipio, at the age of twenty-four, offered to take the command of the Roman army in Spain the year after his father's death. The people already had an intense belief in him, and he was unanimously elected. All Spain west of the Ebro was in the year of his arrival (210) under Carthaginian control, but fortunately for him the three Carthaginian generals, Hasdrubal (Hannibal's brother), Hasdrubal the son of Gisgo, and Mago (also Hannibal's brother), were not disposed to act in concert. Scipio was thus enabled to surprise and capture New Carthage, the headquarters of the Carthaginian power in Spain, from which he obtained a rich booty of war stores and supplies, with a particularly good harbour. The native Spanish tribes now became friendly, and Scipio found useful allies among them. In the following year he fought Hasdrubal somewhere in the upper valley of the Guadalquivir, but the action could hardly have been a decisive one, as soon afterwards the Carthaginian crossed the Pyrenees at the head of a considerable army on his way to Italy. Next year another battle was fought in the same neighbourhood, and Scipio's success appears to have been sufficiently decided to compel the Carthaginian commanders to fall back on Gades, in the south-western corner of Spain. The country was now for the most part under Roman influence, a result due even more to the statesmanlike tact of Scipio than to his military ability. With the idea of striking a blow at Carthage in Africa, the Roman general paid a short visit to the Numidian princes, Syphax and Masinissa, but at the court of Syphax he was foiled by the presence of Hasdrubal, the son of Gisgo, whose daughter Sophonisba was married to the Numidian chief. On his return to Spain Scipio had to quell a mutiny which had broken out among his troops. Hannibal's brother Mago had meanwhile sailed for Italy, and Scipio himself in 206, after having established the Roman ascendancy in Spain, gave up his command and returned to Rome to stand for the consulship, to which he was unanimously elected the following year, the province of Sicily being assigned to him. By this time Hasdrubal with his army had perished on the Metaurus, and Hannibal's movements were restricted to the south-western extremity of Italy. For Rome the worst part of the struggle was over. The war was now to be transferred by Scipio from Italy to Africa. He was himself eagerly intent on this, and his great name drew to him a number of volunteers from all parts of Italy. There was but one obstacle: the old-fashioned aristocracy of Rome did not like him, as his taste for splendid living and Greek culture was particularly offensive to them. A party in the senate would have recalled him, but the popular enthusiasm was too strong for them. A commission of inquiry was sent over to Sicily, and it found that he was at the head of a well-equipped fleet and army. At the commissioners' bidding he sailed in 204 from Lilybæum (Marsala) and landed on the coast of Africa near Utica. Carthage meanwhile had secured the friendship of the powerful Numidian chief Syphax, whose advance compelled Scipio to raise the siege of Utica and to entrench himself on the shore between that place and Carthage. Next year he surprised and utterly defeated Syphax and

drove the Carthaginian army out of the field. There was an attempt at negotiation, but the war party prevailed and Hannibal was recalled from Italy. The decisive battle was fought near the Numidian town of Zama in 202 and ended in Hannibal's complete defeat. Peace was concluded with the Carthaginians in the following year on terms which strictly confined their dominion to a comparatively small territory in Africa, almost annihilated their fleet, and exacted a heavy war contribution. In fact, the independence of Carthage was destroyed, and it became simply a rich commercial city. The old-fashioned and narrow-minded aristocrats who were in sympathy with the "delenda est Carthago" policy subsequently announced by Cato thought these terms too lenient; but Scipio was too great and too generous a man to lend himself to the base work of utterly extinguishing an ancient and noble centre of civilization. Rome was now perfectly safe from attack. It was a great Mediterranean power: Spain and Sicily were Roman provinces, and the north of Africa was under a Roman protectorate. Such was the end, after seventeen years, of the Second Punic War. Scipio was welcomed back to Rome with the surname of Africanus, and he had the moderation and good sense to refuse the many honours which the people would have thrust upon him. For some years he lived quietly and took no part in politics. In 190 his brother Lucius Scipio was consul and, on the understanding that he should have the benefit of the military skill and experience of Africanus, he was entrusted with the war in Asia against Antiochus. The two brothers brought the war to a conclusion by a decisive victory at Magnesia in the same year. Meanwhile Scipio's political enemies had gained ground, and on their return to Rome a prosecution was started against Lucius on the ground of misappropriation of moneys received from Antiochus. As Lucius was in the act of producing his account-books his brother wrested them from his hands, tore them in pieces, and flung them on the floor of the senate-house. He was then himself accused of having been bribed by Antiochus, but he reminded his accusers that the day was ill chosen, as it happened to be the anniversary of his great victory over Hannibal at Zama. There was an outburst of enthusiasm, and Scipio was once again the hero and the darling of the Roman people, who, it is said, crowded round him and followed him to the Capitol. After all, however, he ended his days, as a voluntary exile in all probability, at Liternum on the coast of Campania, dying, it would seem, in 183, the year of Hannibal's death, when a little above fifty years of age. Scipio's wife was Æmilia, daughter of the Æmilius Paulus who fell at Cannæ and who was the father of the conqueror of Macedonia. By her he had a daughter, Cornelia, who became the mother of the two famous Gracchi.

Spain, Northern Africa, the so-called province of Asia, were added to Rome's dominion during his life. Scipio lived to see Rome develop from a merely Italian power to be in fact the mistress of the world, and he himself greatly contributed to this result. Among Rome's great generals we must rank him after Cæsar. He knew how to plan a campaign as well as how to fight a battle, and he had the faculty of inspiring his soldiers with confidence and enthusiasm. He never had to make head against such tremendous difficulties as his great antagonist, and his achievements, great as they were, must be distinctly ranked beneath the marvellous successes of Hannibal. Still the story was told that, in a conversation between the two generals at the court of Antiochus, Hannibal, who had named Alexander as the first and Pyrrhus as the second among military commanders, confessed that had he beaten Scipio he should have put himself before either of them. It seems to be at any rate certain that the two great men respected and admired each other, and it is much to Scipio's credit that he withstood the mean persecution with which the Roman senate followed up the Carthaginian. It may be that he had rather too much aristocratic *habitus* for a statesman in time of peace, but against this we must set the pleasing fact that he was a man of great intellectual culture and could speak and write Greek just as well as his native Latin. He wrote his

own memoirs in Greek. There must indeed have been a wonderful charm about the man, and there was a belief that he was a special favourite of heaven and held actual communication with the gods. It is quite possible too that he himself honestly shared this belief; and so it was that to his political opponents he could be harsh and arrogant and towards others singularly gracious and sympathetic. For a time he enjoyed a popularity at Rome which no one but Cæsar ever attained.

3. **PUBLIUS CORNELIUS SCIPIO AFRICANUS THE YOUNGER.**—This Scipio, also one of Rome's greatest generals, was the younger son of Æmilius Paullus, and he fought when a youth of seventeen by his father's side at Pydna, 168,—the battle which decided the fate of Macedonia and made northern Greece subject to Rome. He was adopted by the eldest son of Scipio Africanus the Elder, and from him took the name Scipio with the surname Africanus. In 151, a time of defeat and disaster for the Romans in Spain, which as yet had been but very imperfectly subjugated, he served with credit in that country and obtained an influence over the native tribes similar to that which the elder Scipio, his grandfather by adoption, had acquired nearly sixty years before him. In the next year an appeal was made to him by the Carthaginians to act as arbiter between them and the Numidian prince Masinissa, who, backed up by a party at Rome, was incessantly encroaching on Carthaginian territory. Rome's policy in Africa was to hold the balance between Masinissa and Carthage, and, when it was seen that Carthage, as the result of several years of peace, was again becoming a prosperous and powerful city, there grew up a feeling at Rome that the Numidian king must be supported and their old rival thoroughly humiliated. Marcus Cato and his party would hear of no compromise; Carthage, they said, must be destroyed if Rome was to be safe. It was easy to find a pretext for war in the disputes between Carthage and Masinissa. In 149 war was declared, and the Carthaginians felt it to be a life-and-death struggle: every man and every woman laboured to the uttermost for the defence of the city with a furious enthusiasm. The Roman army, in which Scipio at first served in a subordinate capacity, was utterly baffled. In the following year he was elected consul, while yet under the legal age, for the express purpose of giving him the supreme command. After two years of desperate fighting and splendid heroism on the part of the defenders, the famished garrison could no longer hold the walls: Carthage was captured, and the ruins of the city were burning for seventeen days; Rome decreed that the place should be for ever desolate. On his return to Rome Scipio became the subject of violent political attacks, against which he successfully defended himself in speeches (no longer extant) that ranked as brilliant specimens of oratory. In 134 he was again consul, with the province of Spain, where a demoralized Roman army was vainly attempting the conquest of Numantia on the Douro. Scipio, after devoting several months to the discipline of his troops, reduced the city by blockade. The fall of Numantia, which was utterly destroyed in 133, established the Roman dominion in the province of Hither or Nearer Spain, the eastern portion of that country. Rome meanwhile was shaken by the great political agitation of the Gracchi, whose sister Sempronia was Scipio's wife. Scipio himself, though not in sympathy with the extreme men of the old conservative party, was decidedly opposed to the schemes of the Gracchi. "Justly slain" (*jure cæsum*) is said to have been his answer to the tribune Carbo, who asked him before the people what he thought of the death of Tiberius Gracchus. This gave dire offence to the popular party, which was now led by his bitterest foes. Soon afterwards, in 129, he was found dead in bed on the morning of a day on which he had intended to make a speech on a point connected with the

agrarian proposals of the Gracchi,—“a victim of political assassination” Mommsen confidently pronounces him. The mystery was never cleared up, and there were political reasons for letting the matter drop.

The Younger Scipio, great general and great man as he was, is for ever associated with a hideous work of destruction at Carthage, which we feel he might have done more to avert. Yet he was a man of culture and refinement; he gathered round him such men as the Greek historian Polybius, the philosopher Panætius, and the poets Lucilius and Terence. And at the same time, according to Polybius and Cicero, he had all the good sterling virtues of an old-fashioned Roman, and steadily set his face against the increasing luxury and extravagance of his day. As a speaker he seems to have been no less distinguished than as a soldier. He spoke remarkably good and pure Latin, and he particularly enjoyed serious and intellectual conversation. There seems to have been nothing mean or grasping about him. After the capture of Carthage he gave back to the Greek cities of Sicily the works of art of which Carthage had robbed them. He did not avail himself of the many opportunities he must have had of amassing a fortune. Though politically opposed to the Gracchi, he cannot be said to have been a foe to the interests of the people. He was, in fact, a moderate man, in favour of conciliation, and he was felt by the best men to be a safe political adviser, while, as often happens in such cases, he could not help offending both parties.

4. Scipios are continually appearing in Roman history in more or less prominent positions down to the time of the empire. One of them, **SCIPIO NASICA** (Nasica denoting an aquiline nose), contemporary of the Younger Africanus, instigated the murder of Tiberius Gracchus, whom the people were bent on re-electing (133) to the tribuneship. Though he was pontifex maximus at the time, the senate, to save him, had to get him away from Rome, and he left never to return, dying soon afterwards in Asia. (W. J. B.)

SCIRE FACIAS, in English law, is a judicial writ founded upon some record directing the sheriff to make it known (*scire facias*) to the party against whom it is brought, and requiring the latter to show cause why the party bringing the writ should not have the advantage of such record, or why (in the case of letters patent and grants) the record should not be annulled and vacated. Proceedings in *scire facias* are regarded as an action, and the defendant may plead his defence as in an action. The writ is now of little practical importance; its principal uses are to compel the appearance of corporations aggregate in revenue suits, and to enforce judgments against shareholders in such companies as are regulated by the Companies Clauses Act, 1845, or similar private Acts, and against garnishees in proceedings in foreign attachment in the lord mayor's court. Proceedings by *scire facias* to repeal letters patent for inventions were abolished by the Patents, Designs, and Trademarks Act, 1883, and a petition to the court substituted.

SCOPAS. See *ARCHÆOLOGY*, vol. ii. p. 360.

SCORESBY, WILLIAM (1789-1857), English arctic explorer and physicist, was born near Whitby, Yorkshire, on 5th October 1789. His father, also named William, who achieved distinction as an arctic whaler, was the son of a farmer near Crompton, Lancashire, where he was born on 3d May 1760. He went to sea when he was twenty years of age, and became one of the most prominent and successful, as well as daring, of arctic whale-fishers. In 1823 he retired with an ample competency, and died in 1829. Young Scoresby made his first voyage with his father to Greenland in 1800, when he was only eleven years of age. On his return, up to 1803, he diligently pursued his education, acquiring a very fair knowledge of mathematics and navigation. From 1803 he was his father's constant companion to the whale-fishery. On 25th May 1806, as chief officer of the "Resolution," he succeeded in reaching 81° 30' N. in 19° E. long., the farthest point north attained by any navigator up to that date. On his return, during the following winter, Scoresby attended the natural philosophy and chemistry classes in Edinburgh

university, as he did again in 1809, when he added several other subjects. In his voyage of 1807 he commenced, as in all subsequent voyages he continued, the study of the meteorology and natural history of the polar regions; among the earlier results are his original observations on snow crystals. In 1809 Professor Jameson of Edinburgh brought Scoresby's arctic papers before the Wernerian Society of that city, of which he was at once elected a member. Soon after attaining his majority, in 1811, Scoresby was promoted to the command of the "Resolution," and in the same year married the daughter of a shipbroker. In 1813 he changed the "Resolution" for the "Esk," in both vessels bringing home large and profitable captures. In his voyage of 1813 Scoresby ascertained that the temperature of the polar ocean is warmer at considerable depths than it is on the surface. Each subsequent spring found Scoresby in search of whales, and no less eagerly of fresh additions to scientific knowledge. His letters of this period to Sir Joseph Banks no doubt gave the first impulse to the modern search for the north-west passage. In 1819 he was elected a fellow of the Royal Society of Edinburgh, and among other papers of the year was one communicated to the Royal Society of London through Sir Joseph Banks, "On the Anomaly in the Variation of the Magnetic Needle," touching upon a subject of the first scientific importance. In 1820 appeared Scoresby's *History and Description of the Arctic Regions*, in which he gathers up the results of his own observation, as well as those of previous navigators, and which still remains a standard authority. In his voyage of 1822 to Greenland, among other scientific work, Scoresby surveyed 400 miles of the east coast, between 69° 30' and 72° 30' N., with so much accuracy that the Government expeditions of the next year were unable to make any substantial correction, although they attempted to ignore his work. This was the last of Scoresby's arctic voyages. On his return he found his wife dead, and this event, acting upon his naturally pious spirit along with other influences, decided him to enter the church. After two years of residence in Cambridge, he in 1825 was ordained and on 17th July was appointed curate of Bassingby. Meantime had appeared at Edinburgh, in 1823, his *Journal of a Voyage to the Northern Whale-Fishery, including Researches and Discoveries on the Eastern Coast of Greenland*. The faithful and successful discharge of his clerical duties at Bassingby, in the mariners' chapel at Liverpool, at Exeter, and at Bradford did not prevent Scoresby from taking as much interest in science as he did during his whaling voyages. In 1824 the Royal Society elected him a fellow, and the Paris Academy of Sciences an honorary corresponding member. From the first he was an active member and official of the British Association, to which he made several important contributions, one being "An Exposition of some of the Laws and Phenomena of Magnetic Induction." To the progress of terrestrial magnetism especially Scoresby is recognized as having largely contributed. Of the sixty papers which follow his name in the Royal Society list many are more or less connected with this department of research. But his observations extended into many other departments, including certain branches of optics. In order to obtain additional data for his theories on magnetism he made a voyage to Australia in 1856, the results of which were published in a posthumous work,—*Journal of a Voyage to Australia for Magnetical Research*, edited by Archibald Smith (1859). He made two visits to America, in 1844 and 1848; on his return home from the latter visit he made some valuable observations on the height of Atlantic waves, the results of which were given to the British Association. Scoresby interested himself much in social questions, especially the

improvement of the condition of factory operatives. He also published numerous works and papers of a religious character, a list of which, as well as of his many scientific papers, is appended to the *Life of William Scoresby* by his nephew, Dr R. E. Scoresby-Jackson (1861). In 1850 he published a work on the Franklin expedition, urging the prosecution of the search for the missing ships, and giving the valuable results of his own experience in arctic navigation. Scoresby was twice married after the death of his first wife,—to Miss Elizabeth Fitzgerald in 1828, and in 1849 to Miss Georgina Kerr. After his third marriage Scoresby built a villa at Torquay, where he spent the remainder of his life, and where he died, 21st March 1857. He was a man of simple but deep piety, amiable, cheerful, and guileless.

SCORPION. See ARACHNIDA, vol. ii. p. 281 sq.

SCOT, MICHAEL, whose fame as a magician has surrounded his history with legend, is sometimes claimed by the Italians as a native of Salerno and by the Spaniards as a native of Toledo; but there is no reason to doubt the Scottish origin to which his name testifies. Scottish tradition is unanimous in identifying him with Sir Michael Scot of Balwearie in Fifeshire, but the ascertainable dates place some difficulties in the way of this. The traditional date of Scot's birth is 1190, but this does not harmonize well with the embassy to Norway attributed to Sir Michael Scot in 1290. Some accordingly have fixed the date of his birth approximately as 1214, but apparently without any further reason than is afforded by the supposed date of his death in 1291. But Jourdain¹ refers to certain manuscript translations of Scot's which are expressly dated "1217 at Toledo." This would accord fairly well with the date 1190, the translations being executed by Scot soon after the conclusion of his student period. Scot is said to have studied at Oxford, whence he proceeded, as was usual, to Paris, then the centre of mediæval learning, devoting himself especially to philosophy and mathematics. Du Boulay, the historian of the university of Paris, adds that he received the degree of doctor of theology and acquired a brilliant reputation in that faculty. There is no evidence of this, however, in his writings. At Toledo, where he also studied, Scot acquired a knowledge of Arabic. It is not likely that his knowledge extended to Greek and the other Eastern tongues mentioned by the earlier bibliographers. His knowledge of Arabic was sufficient to open up to him the Arabic versions of Aristotle and the multitudinous commentaries of the Arabians upon them, with which Western Christendom had only lately become acquainted in Latin translations (see SCHOLASTICISM). It also brought him into contact with the original works of Avicenna and Averroes. His own first work was done as a translator. He was one of the savants whom Frederick II. attracted to his brilliant court, and at the instigation of the emperor he superintended (along with Hermannus Alemannus) a fresh translation of Aristotle and the Arabian commentaries from Arabic into Latin. There exist translations by Scot himself of the *Historia Animalium*, the *De Anima*, and *De Cælo*, along with the commentaries of Averroes upon them. This connexion with Frederick and Averroes—both of evil reputation in the Middle Ages—doubtless contributed to the formation of the legend which soon enveloped Michael Scot's name. His own books, however, dealing as they do almost exclusively with astrology, alchemy, and the occult sciences generally, are mainly responsible for his popular reputation. The chief of these according to the more critical views of recent investigators are *Super Auctorem Sphæræ*, printed at Bologna in 1495 and at Venice in 1631; *De Sole et Luna*, printed at Strasburg, 1622,

¹ *Recherches sur les anciennes traductions Latines d'Aristote*, p. 133.

in the *Theatrum Chemicum*, and containing more alchemy than astronomy, the sun and moon being taken as the images of gold and silver; *De Chiromantia*, an opuscle often published in the 15th century; and, perhaps best known of all, *De Physiognomia et de Hominis Procreatione*, which saw no fewer than eighteen editions between 1477 and 1660. This treatise is divided into three books, of which the first deals with generation according to the doctrine of Aristotle and Galen, the second with the signs by which the character and faculties of individuals may be determined from observation of different parts of the body. The *Physiognomia* (which also exists in an Italian translation) and the *Super Auctorem Sphæræ* expressly bear that they were undertaken at the request of the emperor Frederick. To the above list should be added certain treatises in manuscript,—*De Signis Planetarum*; *Contra Averrhoem in Meteora*; *Notitia Convictionis Mundi Terrestris cum Cælesti, et de Definitione utriusque Mundi*; *De Præsignis Stellarum et Elementaribus*. Michael is said to have foretold (after the double-tongued manner of the ancient oracles) the place of Frederick's death, which took place in 1250. The Italian tradition makes Scot die in Sicily not long afterwards, stating that he foretold the manner of his own death. Jourdain is inclined to agree with this approximate date, observing that Scot is spoken of by Albert the Great as if he were already dead, and that Vincent of Beauvais (d. c. 1268) quotes him with the epithet "vetus." But the generally received tradition makes him return by way of England (where he was received with much honour by Edward I.) to his native country. The ordinary account gives 1291 as the date of Scot's death. According to one tradition he was buried at Holme Cultram in Cumberland; according to another, which Sir Walter Scott has followed in the *Lay of the Last Minstrel*, in Melrose Abbey. In the notes to that poem, of which the opening of the wizard's tomb forms the most striking episode, Scott gives an interesting account of the various exploits attributed by popular belief to the great magician. "In the south of Scotland any work of great labour and antiquity is ascribed either to the agency of Auld Michael, of Sir William Wallace, or the devil." He used to feast his friends with dishes brought by spirits from the royal kitchens of France and Spain and other lands. His embassy to France alone on the back of a coal-black demon steed is also celebrated, in which he brought the French monarch to his feet by the effects which followed the repeated stamping of his horse's hoof. Other powers and exploits are narrated in Folengo's Macaronic poem of *Merlin Coccarius* (1595). But Michael's reputation as a magician was already fixed in the age immediately following his own. He appears in the *Inferno* of Dante (canto xx. 115-117) among the magicians and soothsayers—

"Quell' altro, che ne' fianchi è così poco,
Michele Scotto fù; che veramente
Delle magiche frode seppe il giuoco."

He is represented in the same character by Boccaccio, and is severely arraigned by John Pico de Mirandola in his work against astrology, while Naudé finds it necessary to defend his good name in his *Apologie pour les grands personages fausement accusés de magie*.

SCOT, REGINALD (c. 1538-1599), was the son of Richard, third son of Sir John Scot of Scotshall, Smeeth (Kent), studied at Hart Hall in Oxford, and afterwards lived in studious retirement at Smeeth, dying in 1599. He was the author of a very remarkable book, *The Discoverie of Witchcraft*, the object of which was to put an end to the cruel persecution of witches, by showing that "there will be found among our Witches only two sorts; the one sort being such by imputation, as so thought of by others (and

these are abused and not abusers), the other by acceptance, as being willing so to be accounted, and these be meer Coseners." This thesis is worked out in sixteen books, with great learning and acuteness, in a spirit of righteous indignation against the witchmongers. Scot was far in advance of his time, and his book, of which the first edition appeared in 1584, was burned by order of King James I. The book is still interesting, not only as having anticipated Bekker by a century, but for the great mass of curious details as to every branch of so-called witchcraft which it contains. It also takes up natural magic and conjuring at considerable length (bk. xiii.), and contains an argument against "alchemy" (bk. xiv.).

Scot also published in 1574 *A perfitte Platforme of a Hoppe Garden* (3d ed. 1578), which is noteworthy as having originated the cultivation of the hop in England. A second edition of the *Discoverie* appeared in 1651 and a third in 1665; the latter contained nine new chapters, prefixed by an anonymous hand to bk. xv. of the *Discoverie*, and the addition of a second book to the "Discourse concerning Angels and Spirits."

See B. Nicholson's *Scot's Discoverie of Witchcraft*, London, 1886.

SCOTER, a word of doubtful origin, perhaps a variant of "Scout," one of the many local names shared in common by the GUILLEMOT (vol. xi. p. 262) and the RAZORBILL (vol. xx. p. 302), or perhaps primarily connected with COOT (vol. vi. p. 341),¹ the English name of the *Anas nigra* of Linnæus, which with some allied species has been justifiably placed in a distinct genus, *Ædemia* (often misspelt *Oidemia*)—a name coined in reference to the swollen appearance of the base of the bill. The Scoter is also very generally known around the British coasts as the "Black Duck" from the male being, with the exception of a stripe of orange that runs down the ridge of the bill, wholly of that colour. In the representative American form, *Æ. americana*, the protuberance at the base of the bill, black in the European bird, is orange as well. Of all Ducks the Scoter has the most marine habits, keeping the sea in all weathers, and rarely resorting to land except for the purpose of breeding. Even in summer small flocks of Scoters may generally be seen in the tideway at the mouth of any of the larger British rivers or in mid-channel, while in autumn and winter these flocks are so increased as to number thousands of individuals, and the water often looks black with them. A second species, the Velvet-Duck, *Æ. fusca*, of much larger size, distinguished by a white spot under each eye and a white bar on each wing, is far less abundant than the former, but examples of it are occasionally to be seen in company with the commoner one, and it too has its American counterpart, *Æ. velvetina*; while a third, only known as a straggler to Europe, the Surf-Duck, *Æ. perspicillata*, with a white patch on the crown and another on the nape, and a curiously particoloured bill, is a not uncommon bird in North-American waters. All the species of *Ædemia*, like most other Sea-Ducks, have their true home in arctic or subarctic countries, but the Scoter itself is said to breed occasionally in Scotland (*Zoologist*, s.s. p. 1867). The females display little of the deep sable hue that characterizes their partners, but are attired in soot-colour, varied, especially beneath, with brownish white. The flesh of all these birds has an exceedingly strong taste, and, after much controversy, was allowed by the authorities to rank as fish in the ecclesiastical dietary (cf. Graindorge, *Traité de l'origine des Macreuses*, Caen, 1680; and *Correspondence of John Ray*, Ray Soc. ed., p. 148).

¹ In the former case the derivation seems to be from the O. Fr. *Escoute*, and that from the Latin *auscultare* (comp. Skeat, *Etymol. Dictionary*, p. 533), but in the latter from the Dutch *Koet*, which is said to be of Celtic extraction—*cwtiar* (op. cit., p. 134). The French *Macreuse*, possibly from the Latin *macer*, indicating a bird that may be eaten in Lent or on the fast days of the Roman Church, is of double signification, meaning in the south of France a Coot and in the north a Scoter. By the wild-fowlers of parts of North America Scoters are commonly called Coots.

SCOTLAND

PART I.—HISTORY.

Agricola's campaigns.

1. *Roman Period.*—The first certain lines of the history of Scotland were written by the Romans. Their account of its partial conquest and occupation for more than three hundred years gives the earliest facts to which fixed dates can be assigned. The invasion commenced by Julius Cæsar reached Agricola's last campaign limits never afterwards exceeded. It was in the last year of Vespasian's life that Julius Agricola, the ablest general bred in his camp, came to command the army in Britain. Landing in midsummer 78, he at once commenced a campaign against Wales. In his second campaign he passed the Solway and, defeating the tribes of Galloway, introduced rudiments of Roman civilization in the district where Ninian taught the rudiments of Christianity three centuries later. This was the first conquest within modern Scotland. Two main roads, of which traces can still be seen, mark his advance: the western, from Carlisle through Dumfries and Lanark, extends across the Clyde to Camelon on the Carron; and the eastern, from Bremenium (High Richeston) in Northumberland, passes through Roxburgh and Lothian to the Forth at Cramond. Next year Agricola subdued unknown tribes, reached the estuary of the Tay, and occupied camps at various points of central Scotland, in the future shires of Stirling and Perth. Traces of them are still visible at Bochastle near Callander, Dalginross near Comrie, Fendoch on the Almond, Inveralmond at the junction of the Almond with the Tay near Perth, Ardargie on the north of the Ochils, and the great camp at Ardoch south of Crieff. The fourth year of his command was devoted to the construction of a line of forts between the Forth and the Clyde. This barrier, strengthened by a wall in the reign of Antoninus Pius, guarded the conquests already made against the Caledonians—the general Latin name of the northern tribes of the forests and mountains, the Highlanders of later times—and, in connexion with camps already occupied in the lowlands of Perthshire, formed the base for further operations. In the fifth year Agricola crossed the Clyde, and, without making any permanent conquest on the western mainland, viewed from Cantyre the coast of Ireland. Statements by one of its chiefs as to the character and factions of that country, whose ports were already known to Roman merchants, led to the opinion communicated to Tacitus by Agricola, that with a single legion and a few auxiliaries he could reduce it to subjection. The number of legions in the Roman army of Britain was fixed at five, besides auxiliaries and cavalry,—a total of perhaps 50,000 men. The resistance of northern Britain explains why the easier conquest was not undertaken. A year was required to explore the estuaries of the Forth and the Tay with the fleet. The absence of camps indicates that no attempt was made to conquer the peninsula of Fife, perhaps a separate kingdom; and Agricola prepared to advance against the Caledonians. Two years' fighting, although Tacitus chronicles only an assault on the advanced camp of the IXth legion (at Lintrose(?) near Coupar Angus), passed before the final engagement known in history as the battle of the Grampians (84). It was probably fought in the hilly country of the Stormont near Blairgowrie, the Celts descending from strongholds in the lowest spurs of the Grampians and attacking the Romans, whose camp lay near the junction of the Isla and the Tay. It decided that the Roman conquest was to stop at the Tay: Galgacus, the Caledonian leader, was, according to the Roman historian, defeated; but in the following winter Agricola retreated to the

camp between the Forth and the Clyde, while the fleet 78-120. was sent round Britain. Starting probably from the Forth and rounding the northern capes, it returned after establishing the fact, already suspected, and of so much consequence in future history, that Britain was an island,—planting during its progress the Roman standard on the Orkneys, which had for several centuries been known by report, and sighting Shetland, the Thule of earlier navigators. Agricola, with one legion—probably the IXth, which had suffered most—was now recalled by Domitian.

The absence of any notice of Britain for twenty years implies the cessation of further advances,—a change of policy due to the reverses in the Dacian War and the financial condition of the empire.

The indefatigable Hadrian came to Britain (120) with the VIth legion, named *Victrix*, which replaced the IXth. He began, and his favourite general Aulus Plautorius Nepos completed, between the mouth of the Tyne near Newcastle and the Solway near Carlisle, the great wall of stone (see HADRIAN, WALL OF), about 80 miles in length, 16 feet high, and 8 feet thick, protected on the north by a trench 34 feet wide and 9 deep, with two parallel earthen ramparts and a trench on the south,—proving the line required defence on both sides. Massive fragments of the wall, its stations, castles, and protecting camps, with the foundation of a bridge over the North Tyne, may be still seen. It was garrisoned by the VIth legion, and by the XIth and XXth, which remained throughout the whole Roman occupation. The conquests of Agricola in what is modern Scotland were for a time abandoned. Hadrian's wall was the symbol of the strength of Rome, and also of the valour of the northern Britons. There must have been a stubborn resistance to induce the conquerors of the world to set a limit to their province, though the roads through the wall showed they did not intend this limit to be permanent. The first step had been taken. The country between the Tyne and Solway and the Forth and Clyde, including the southern Lowlands of Scotland, was now within the scope of Roman history, if not yet of Roman civilization. The country north of the last two rivers remained barbarous and unknown under its Celtic chiefs. Hadrian had thus resumed the task of Agricola, in one of the rapid campaigns by which he consolidated the empire through visits to its most distant parts; but it is doubtful whether he passed beyond the wall, which continued to separate the Romans from the barbarians. In the reign of his successor, Antoninus Pius, Lollius Urbicus recovered the country from the wall of Hadrian to the forts of Agricola, and built an earthen rampart about half the length of the southern wall, 20 feet high and 24 thick, protected on the north by a trench 40 feet wide and 20 deep. It was known later as Grim's or Graham's dyke. Remains may yet be seen between Carriden near Borrowstounness on the Forth and West Kilpatrick on the Clyde, with forts either then or subsequently erected at intermediate stations, connected by a military road on the south of the wall.

About this period Ptolemy composed the first geography of the world, illustrated by maps—probably constructed somewhat later geography.—of Ireland and Britain, still called *Albion*.¹ South of modern Scotland the plan and description of the distances are generally accurate, but north of the Solway (*Itune Æstuarium*) and the Wear (? *Vedra*) the island is figured as lying west and east instead

¹ His information must have come from Roman officers, who, we know, studied this branch of the military art, as maps have been found painted on the porticoes of their villas.

161 364. of north and south. Learned ingenuity corrects this error and, by other modifications and the use of a few points deemed certain, applies the names of Ptolemy to places on the map of modern Scotland. But the certain points are almost confined to the Clyde (*Glotta Æstuarium*), the Forth (*Boderia Æstuarium*), the Tay (*Tava Æstuarium*), and perhaps the Wear (*Vedra*) and the Nith (*Novius*), the Caledonian Wood (*Caledonia Silva*), and the Orkneys (*Orcades*). Even if the other identifications were clear, it would not add much to our knowledge of ancient Scotland. The names of Ptolemy are names on his map and in books only. No tribe (except the Caledonii), no town, no river (except the Forth and Clyde and Tay), no island (except the Orkneys), was, so far as we know, called before or since by the names which there appear. No inscription or coin confirms them. No mountains in this land of mountains are to be found on the plan of the geographer. Etymological conjecture, after allowance for mispronunciation and errors of transcribers, fails to reconcile the names of Ptolemy with the oldest names of Celtic origin still retained by the rivers and hills. Yet the attempt represents the highest knowledge embodied in writing to which the Romans attained of this distant and disputed part of the empire, for the *Itineraries*, except the forged one attributed to Richard of Cirencester, stop at Hadrian's wall. His treatise remained until the revival of learning the only written geographical description of the country from which the learned could picture northern Britain. With all its imperfections and mistakes, it conveyed in rough outline the figure of a country to the west of the European continent, to the north of the Roman province of Britain, to the east of Ireland, surrounded by the German Ocean, the Northern Ocean, and the Irish Channel, with bold promontories and many rivers (several tidal), peopled by various tribes, its towns chiefly on the rivers or the coast, and in its centre the vast forest to which the Caledonians gave or from which they received their name, itself the northern part of the largest British island, with groups of smaller isles lying off its northern and western shores. This region was unknown to Cæsar and imperfectly known to Tacitus,—the only writer of the first century to whom we can resort. Yet the description of the Britons by the greatest historical genius of Rome, based on the account of one of its greatest generals, attempts a discrimination between the Celtic tribes first and those afterwards conquered, which may perhaps be applied to the inhabitants of the north as contrasted with those of the south of Britain.

Tacitus's
account
of inha-
bitants.

"Whether the inhabitants of Britain were indigenous or foreigners, being barbarian, they did not take the trouble to inquire. The different character of their bodily appearance in different parts of the island gave rise to arguments. The red hair and big limbs of the natives of Caledonia point to a German origin. The coloured faces of the Silures, their hair generally plaited, and Spain being opposite give credit to the opinion that the ancient Iberi had migrated and occupied these settlements. Those nearest the Gauls were like them, whether on account of the enduring force of descent or the position of the sky determining in lands adjoining the character of the races. On a general view it is credible that the Gauls occupied the neighbouring island. You may detect the same sacred rites and superstitions. There is not much difference in their language. There is the same daring in demanding, the same fear in declining danger. The Britons exhibit greater fierceness, as a long peace has not yet softened them. For we have heard that the Gauls also were distinguished in war, until sloth came with ease and valour was lost with freedom. This too has been the case with the Britons formerly conquered. The rest remain what the Gauls were. Their strength is in their foot; some tribes, however, fight also from chariots. The noble drives; his followers are in front. Formerly they obeyed kings. Now they are distracted by parties and factions amongst their chiefs, and the want of common counsel is most useful to us. An agreement between two or three states to resist a common danger is rare; so while they fight singly the whole are defeated."

In the account of the battle of the Grampian Mount and the speech of Galgacus there is little that is local or individual. What the Celtic chief said in an unknown tongue can scarcely have been literally interpreted to the Romans. The historian trained in oratory embodies in Latin eloquence the universal sentiments of freedom. It may be thought, however, that the soil and air of Scotland favour independence of action and thought, and that the words, whether of Tacitus or of Galgacus, contain an unconscious prophecy of passages in its future annals and traits in the character of its people not yet obliterated. In the first century of the Christian era Scotland was the scene of events which belong to universal history.

Hadrian
to
Severus.

The necessity of the walls of Hadrian and Antonine to protect the Roman province soon appeared. It is doubtful how long or during what intervals the country between them remained subject. Few coins of emperors later than Antonine have been found to the north of Hadrian's wall.

In the reign of Aurelius, the philosophic emperor, war was not encouraged; but Calphurnius Agricola had to be sent (161) as legate and *proprætor* to Britain to prevent incursions of the northern tribes. In that of Commodus a more formidable invasion passed the wall, but Ulpius Marcellus drove back the Britons and repaired it, gaining for Commodus the title of *Britannicus*. While Septimius Severus was removing rivals from his path, his legate, Virius Lupus, purchased peace (201) from the *Meatae*, a tribe of central Scotland now first named, who along with the Caledonii supersede the older designations of Tacitus and Ptolemy for the population in the vicinity and to the north of Antonine's wall, until in the latter half of the 4th century the Picts and Scots appear. Seven years later (208) Severus, with his sons Caracalla and Geta, came, Severus like Edward I. in his last campaign, worn out in body but not in spirit, to Britain.¹ After repairing the breaches in Hadrian's wall he not only reconquered the country between it and the wall of Antonine, which he restored, but, passing beyond the steps of Agricola, carried the Roman eagles to the most northern points they reached. The traces of Roman roads from Falkirk to Stirling, through Strathearn to Perth, thence through Forfar, Mearns, and Aberdeen to the Moray Firth, and of Roman camps at Wardykes (Keithock), Raedykes (Stonehaven), Norman Dykes (on the Dee), and Raedykes on the Ythan belong to this period and represent an attempt to subdue or overawe the whole island. The historian Dion does not conceal the failure of the enterprise, which he ascribes to the illness that terminated in the death of Severus at York (211). He adds a little to our knowledge of the Caledonians by describing the painting of their bodies with forms of animals, their scanty clothing and iron ornaments, their arms—a sword, small shield, and spear, without helmets or breastplates—their chariots, and their mode of warfare by rapid attack and as rapid retreat to the forest and the marsh. Being without towns, they lived on the produce of herds and the chase, not on fish, though they had plenty. Their mode of government he calls democratic, doubtless from the absence of any conspicuous king rather than of chiefs.

From the death of Severus to the accession of Constantius Chlorus, a period of nearly a century, the history of northern Britain is unknown. In the first (305) of the two years of his reign Constantius defeated the tribes between the walls called by Eumenius the Panegyrist "the Caledonians and other Picts,"—a name now first heard, and by this association identified with the Caledonians. Next year Constantius died at York; and for more than fifty years a veil is again drawn over northern Britain. It was during this period that Constantine was converted to Christianity, which his father Constantius had favoured during the persecutions of Diocletian. So rapid was the progress of the church in the British province that only ten years after the martyrdom of St Alban Celtic bishops of York, London, and Caerleon—probably the place of that name on the Usk—were present at the council of Arles. In 360 the Scots are for the first time named, by Ammianus Marcellinus, who records their descent along with the Picts upon the Roman province in terms which imply that they had before passed the southern wall. Four years later the Picts, Saxons, Scots, and Attacotts are said by the same writer to have caused the Britons perpetual anxiety; but Theodosius, father of the emperor of the same name, repulsed them

Constantius to
departure of
Romans.

¹ Papinian, the great jurist, then administered justice at York. Whether the Roman law so introduced survived in any part of modern England is a problem not yet solved; it certainly did not beyond the wall. The Roman substratum of Scottish law was of later origin, derived chiefly from the canon law of the church.

and recovered the country between the walls, which became (368) a fifth province of Britain, called in honour of the reigning emperor Valentinian. It remained so for a very brief space: the revolt of Maximus (391), which reduced the Roman troops to two legions, led to fresh raids of the Picts and Scots. A legion sent by Stilicho drove them back to the northern wall. But it was soon recalled, and the garrisons were permanently removed prior to 409.

Effects of
Roman
occupa-
tion.

The Roman empire in Britain left widely different results in the southern and in the northern portions of the island. The former became an organized, and in the centres of population a civilized province, in which Latin was spoken by the educated, the arts cultivated, Roman law administered, and Christianity introduced. The latter, with the partial exception of the district south of Antonine's wall, remained in the possession of barbarous heathen races, whose customs had altered little since Roman writers described them as similar to, though ruder than, those of the Celts in Gaul before its conquest. The condition of the population between the walls was probably intermediate between that of the southern provincial Britons and that of the northern savages of the same original Celtic stock, more nearly resembling the latter, perhaps not unlike the condition of the people of Wales, which the Romans in like manner overran, but could not hold, or of Afghanistan as compared with British India. No Roman towns existed, and only one or two villas have been found north of York, and quite near to that place. The camp, the altar, the sepulchral monument, possibly a single temple (the mysterious Arthur's Oven or Julius's Hof on the Carron, now destroyed, but described by Boece and Buchanan and figured by Camden), the stations along the wall, the roads with their milestones, a number of coins (chiefly prior to the 2d century), and a few traces of baths are the only vestiges of Roman occupation in this part of Britain. So completely had Britain passed beyond the serious attention of the emperor of the East that in the beginning of the 6th century Belisarius, Justinian's general, sarcastically offered it to the Goths in exchange for Sicily; while Procopius, the Byzantine historian, has nothing to tell of it except that a wall was built across it by the ancients, the direction of which he supposes to have been from north to south, separating the fruitful and populous east from the barren serpent-haunted western district, and the strange fable that its natives were excused from tribute to the kings of the Franks in return for the service of ferrying the souls of the dead from the mainland to the shores of Britain.

Britons or
Britons.

2. *Early Celtic Period to Union of Picts and Scots by Kenneth Macalpine.*—It is to the Celts, the first known inhabitants of Britain, that our inquiry next turns. This people were not indigenous, but came by sea to Britain. A conjecture, not yet proved, identifies as inhabitants of Britain before the Celts a branch of the race now represented in Europe only by the Basques. Amongst many names of British tribes in Latin writers three occur, two with increasing frequency, as the empire drew near its close—Britons, Picts, and Scots—denoting distinct branches of the Celts. Britain was the Latin name for the larger island and Britons for its inhabitants; Albion, a more ancient title, has left traces in English poetry, and in the old name Alba or Albany for northern Scotland. The Britons in Roman times occupied, if not the whole island, at least as far north as the Forth and Clyde. Their language, British, called later Cymric, survives in modern Welsh and the Breton of Brittany. Cornish, which became extinct in the 17th century, was a dialect of the same speech. Its extent northwards is marked by the Cumbræ—the Islands of Cymry in the Clyde—and Cumberland, a district originally stretching from the Clyde to the Mersey.

Picts or
Cruithne.

The Picts, a Latin name for the northern tribes who preserved longest the custom of painting their bodies, called themselves Cruithne. Their original settlements appear to have been in the Orkneys, the north of Scotland, and the north-east of Ireland—the modern counties of Antrim and Down. They spread in Scotland, before or shortly after the Romans left, as far south as the Pentland Hills, which, like the Pentland Firth, are thought to preserve their name, occupied Fife, and perhaps left a detachment in Galloway. Often crossing, probably some-

times using, the deserted wall of Hadrian, they caused it 368-6th cent. to acquire their name,—a name of awe to the provincial Britons and their English conquerors. Their language, though Celtic, is still a problem difficult to solve, as so few words have been preserved. Its almost complete absorption in that of the Gaels or Scots suggests that it did not differ widely from theirs, and with this agrees the fact that Columba and his followers had little difficulty in preaching to them, though they sometimes required an interpreter. Some philologists believe it to have been more allied to Cymric, and even to the Cornish variety; but the proof is inconclusive.

The Scots came originally to Ireland, one of whose names from the 6th to the 13th century was Scotia; Gael. Scotia Major it was called after part of northern Britain in the 11th century had acquired the same name. Irish traditions represent the Scots as Milesians from Spain. Their Celtic name Gaidhil, Goidel, or Gael appears more akin to that of the natives of Gaul. They had joined the Picts in their attack on the Roman province in the 4th century, and perhaps had already settlements in the west of Scotland; but the transfer of the name was due to the rise and progress of the tribe called Dalriad, which migrated from Dalriada in the north of Antrim to Argyll and the Isles in the beginning of the 6th century. Their language, Gaidhelic, was the ancient form of the Irish of Ireland and the Gaelic of the Scottish Highlanders. No clear conclusion has been reached as to the meaning of Briton, Cruithne, Scot, and Gael.

The order of the arrival of the three divisions of the Celtic race and the extent of the islands they occupied are uncertain. Bede in the beginning of the 8th century gives the most probable account.

"This island at the present time contains five nations, the Angles, Britons, Scots, Picts, and Latins, each in its own dialect cultivating one and the same sublime study of divine truth. . . . The Latin tongue by the study of the Scriptures has become common to all the rest. At first this island had no other inhabitants but the Britons, from whom it derived its name, and who, carried over into Britain, as is reported, from Armorica, possessed themselves of the southern parts. When they had made themselves masters of the greatest part of the island, beginning at the south, the Picts from Scythia, as is reported, putting to sea in a few long ships, were driven by the winds beyond the shores of Britain, and arrived on the northern coast of Ireland, where, finding the nation of the Scots, they begged to be allowed to settle among them, but could not succeed in obtaining their request. The Scots answered that the island could not contain them both, but 'we can give you good advice what to do: we know there is another island not far from ours, to the east, which we often see at a distance, when the days are clear. If you go thither you will obtain a settlement; or, if any should oppose, you shall have our aid.' The Picts accordingly, sailing over into Britain, began to inhabit the northern part of the island. In process of time Britain, after the Britons and Picts, received a third nation, the Scots, who, migrating from Ireland under their leader Renda, either by fair means or force secured those settlements amongst the Picts which they still possess." "There is," he says in another passage, "a very large estuary of the sea which formerly divided the nation of the Picts from the Britons, which gulf runs from the west far into the land, where to this day stands the strong city of the Britons called Alclyth. The Scots arriving on the north side of the estuary settled themselves there as in their own country."

This statement in its main points (apart from the country from which the Picts are said to have come) is confirmed by Latin authors, in whose meagre notices the Picts appear before the Scots are mentioned, and both occur later than the Britons; by the legends of the three Celtic races; by the narratives of Gildas and Nennius, the only British Celtic historians, the Irish *Annals*, and the Pictish *Chronicle*. It is in harmony with the facts contained in the *Life of Columba*, written in the 7th century, but based on an earlier *Life*, by one of his successors, Cumine, abbot of Iona, who may have seen Columba, and must have known persons who had. The northern Britain brought before us in connexion with Columba in the latter

5th and 6th cents. half of the 6th century is peopled by Cruithne or Picts in the north and central Highlands, having their chief royal fort on the Ness, and by Scots in Argyll and the Isles, as far north as Iona and on the mainland Drumalban, the mountain ridge which separates Argyll from Perth and Inverness; there is a British king ruling the south-west from the rock on the Clyde then known as Alclyth or Alclyde, now Dumbarton; and Saxony, under Northumbrian kings, is the name given to the district south of the Forth, including the eastern Lowlands, where by this time Angles had settled. The scarcity of Celtic history¹ belonging to Scotland indicates that its tribes were less civilized than their Irish and Welsh kin.

Conversion to Christianity.

It is in the records of the Christian church that we first touch historic ground after the Romans left. Although the legends of Christian superstition are almost as fabulous as those of heathen ignorance, we can follow with reasonable certainty the conversion of the Scottish Celts. Three Celtic saints venerated throughout Scottish history—Ninian, Kentigern, Columba—Patrick, the patron saint of Ireland, David, the patron saint of Wales, and Cuthbert, the apostle of Lothian and patron saint of Durham, belonging to the Celtic Church, though probably not a Celt, mark the common advance of the Celtic races from heathenism to Christianity between the end of the 4th and the end of the 6th century. The conversion of Scotland in the time of Pope Victor I. in the 2d century is unhistoric, and the legend of St Rule (Regulus) having brought the relics of St Andrew in the reign of Constantius from Achæa to St Andrews, where a Pictish king built a church and endowed lands in his honour, is, if historical at all, antedated by some centuries. There is no proof that amongst the places which the Romans had not reached, but which had accepted Christianity when Tertullian wrote, there was any part of modern Scotland; but, as Christian bishops from Britain without fixed locality begin to appear in the 4th century, possibly the first converts in Scotland had been made before its close.

Ninian. NINIAN (*q.v.*), the son of a British chief in Galloway already Christian, after converting or reforming his countrymen—one of his converts being Tudwalla, king of Alclyde (? Tothael, father of

¹ Of the three branches of the Celts which appear as the first known inhabitants of Scotland the native records are scanty and of late date. Respecting the Britons nothing remains except the *History* of Gildas in the 6th and that of Nennius in the 9th century, of which very small parts relate to Scotland; the poems of Aneurin and Taliesin, commonly called Welsh bards, but perhaps natives of Strathclyde; the lives of saints; and a fragment of criminal law, common to them and the Scots, preserved at the time of its suppression by Edward I.

Dealing with the Picts there is a Latin *Chronicle* of the 10th century and additions of later date, containing a valuable list of kings in their own language, and the entries in the *Book of Deer* of the gifts to that monastery by the Pictish mormaers (chiefs) of Buchan; but the earliest of these is in an old form of Gaelic.

The Scots are noticed in the *Life of Columba*, the *Duan Albanach* of the 11th century, a Latin *Chronicle* of the 12th century, a few poems treating of their origin and migration, later Latin tracts describing their settlement in Scotland, and the lives of saints, not written in their existing form till the 12th century. But a considerable amount of legendary material, chiefly consisting of additions to or glosses on the earlier sources, has been collected. When all is told, Scotland has nothing to compare with the Irish *Annals* and the Welsh *Triads*, whose fulness of detail and fabulous antiquity in the early portions raise suspicions as to the later which are perhaps undeserved. It has no equivalent to the collection of laws contained in the *Senchas Mór* or *Kain Patrick* of Ireland and the Dimetian and Venedotian codes of Wales, where, in the midst of a crowd of minute customs implying a long settlement in western lands, there are traces of others that seem to have come with the Celts from their far-off Eastern birth-place. From these sources—especially from the Irish *Annals*, and in particular the *Annals* of Tigernach, who died in 1088, the *Synchronisms* of Flann Mainistreach, who died in 1056, the *Annals* of Innisfallen, compiled in 1215, and of Ulster, compiled in 1498, but from older authorities—the dearth of proper Scottish material has been supplemented; but this source of information has to be used with caution. The whole materials are collected in the *Chronicles of the Picts and Scots*, edited by Mr Skene for the lord clerk register of Scotland.

Rydderick Hael)—and organizing a diocese, went as a missionary to the southern Picts, who lived amongst or near the mountains north of the Forth and Clyde in the modern counties of Stirling, Perth, and Forfar. His fame grew with the church, and as far north as Shetland, as far south as Westmoreland and Northumberland, churches were dedicated in his name. His wonder-working relics in the shrine of Candida Casa (at Whithorn² in Galloway) became an object of pilgrimage for more than a thousand years. Three other missionaries belong to the period between Ninian and Kentigern, his successor amongst the Britons of the west: Palladius, sent to the Christians in Ireland by Pope Celestine, died at Fordoun in Mearns labouring amongst the Picts, and his disciples Serf and Ternan converted respectively the Picts of Fife and those of the lowlands of Aberdeen. KENTIGERN (*q.v.*) of Strathclyde was supported by Rydderick or Roderick, called Hael ("the Liberal") from his bounty to the church. Columba visited Kentigern at the cemetery of Ninian, on the Molendinar Burn, where courtesies were interchanged between these representatives of the two branches of the Celtic Church in western Scotland, shortly before the British bishops declined at the meeting at St Augustine's oak to submit to the Roman missionary who had converted the Saxons of southern England. Jocelyn of Furness states that Kentigern was at Rome seven times and obtained the privilege of being the pope's vicar free from subjection to any metropolitan. The prince of Cumbria is even said to have acknowledged his precedence. These are inventions of a later age; but the large possessions, extending over the whole western kingdom, conferred by Rydderick, and after a long lapse of time found by the inquest of David I. when prince of Cumbria to have belonged to the see, may be historical. He died about the beginning of the 7th century, and a long period of darkness hides the British kingdom and church of Strathclyde. St PATRICK (*q.v.*), succeeding where Palladius failed, Christianized Ireland in the middle of the 5th century. A passage in his *Confession*, if all of it applies to Scotland, seems to prove the existence of the church in Scotland for two generations before Patrick's birth, and the allowance during these of marriage to the clergy.

Scotland gave Patrick to Ireland, and Ireland returned the gift in Columba. A rare good fortune has preserved in Adamnan's *Life* the tradition of the acts of the greatest Celtic saint of Scotland, and a picture of the monastic Celtic Church in the 6th and 7th centuries,—an almost solitary fragment of history between the last of the Roman and the first of the Anglo-Saxon historians. Born in 521 at Gartán in Donegal, COLUMBA (*q.v.*) spent his boyhood at Doire Eithne near Gartán, his youth at Moville on Strangford Lough under Abbot Finian, called the foster-father of the Irish saints from the number of his disciples. Here he was ordained deacon, and, after completing his education under Gemmian, a Christian bard, at the monastery of Clonard, he received priest's orders. In 561 he took part in the battle of Culdrevny (in Connaught), when the chiefs of the Húi Néill (Dalriad Scots), his kindred, defeated Diarmid (Diarmait), a king of eastern Ireland. Excommunicated by the synod of Teltown in Meath, the country of Diarmid, for his share in the battle—according to one account fought at his instance—and moved by missionary zeal, he crossed two years afterwards the narrow sea which separates Antrim from Argyll with twelve companions and founded the monastery of Iona (Hy), on the little island to the west of Mull, given him by his kinsman Conall. The Dalriad Scots, who had settled in the western islands of Scotland and in Lorn early in the 6th century, were already Christians; but Columba soon after visited the Pictish king Brude, the son of Mallochon, at Craig Phadrich, the isolated hill fort on the Ness, whom he converted, and from whom he received a confirmation of Conall's grant. Columba, on the death of Conall, gave the sanction of religion to the succession of his cousin Aidan, and at the council of Druceat in Derry obtained the exemption of the Dalriads of Iona from tribute, though they were still bound to give military service to the Irish king, the head of the Húi Néill. He frequently revisited Ireland and took part in its wars: the militant spirit is strongly marked in his character; but most of his time was devoted to the administration of his monastery of Iona, and to the planting of other churches and religious houses in the neighbouring isles and mainland, till his death in 597. None of the remains now found in almost every island—not even those in Iona itself—date from his time, when wood was still used for building. But the original foundations of the churches of Skye and Tiree were his work; those extending from Bute and Cantyre—on Islay, Oronsay, Colonsay, Mull, Eigg, Lewis, Harris, Benbecula, and even the distant St Kilda—to Loch Arkaig on the northern mainland of Scottish Dalriada are to be ascribed to him or his immediate followers or successors in the abbacy, as well as those in the country of the Picts, from the Orkneys to Deer in Buchan. The churches which received his name farther south were later foundations in his honour. The most celebrated of his disciples were Baithene, his successor as abbot; Machar, to whom the church of Aberdeen traces its origin;

² In a cave at Glasserton rude crosses incised on stone—probably a font—and the letters SANCT. NI. P. (?) have recently been found.

Cormac, the navigator, the first missionary to the Orkneys, who perhaps reached the Faroes and Iceland; and Drostan, the founder of the Scottish monastery of Deer.

Celtic Church of Columba. The character of the Celtic Church of Columba was, like its mother church in Ireland, modified by migration to a country only in small part Christian. It was a missionary church, not diocesan but monastic, with an abbot who was a presbyter, not a bishop, for its head, though the office of bishop for ordination existed, and bishops were, in Ireland at least, more numerous than in the later church. It spread, not by the erection of parishes and the care of parochial clergy, but by the reproduction of similar monasteries, the homes of those who adopted a religious life, the only schools in an age of war. It preferred islands for its monasteries for safety, and, in the case of some of its members, who sought, in the language of those times, "a desert in the ocean," as hermitages where they might live and die apart from the world. But these were exceptions. The idea of the Celtic monastery was that of a Christian celibate society. Its inmates regarded themselves as being, and often were, members of a family or clan, preserving the customs of their race so far as consistent with celibacy and religious discipline. Of eleven successors of Columba as abbot nine were of his kin. The rule, though its confession is primitive, adapted to an infant and isolated church planted in a heathen world, did not differ greatly from that of later orders. Implicit obedience to the superior, poverty, chastity, hospitality, were the chief precepts. The observance of Easter according to the ancient cycle, the use of the semicircular instead of the coronal tonsure, and a peculiar ritual for mass and baptism were its chief deviations from the practice of the catholic church as fixed by the council of Nice, to which it yielded in the beginning of the 8th century; frequent prayer, the singing of psalms and hymns, the reading of Scripture, the copying and illuminating of MSS., the teaching of children and novices, and the labour to provide and prepare the necessary food (the service of women being excluded) were the occupations of the monks. A similar conventual system of which St Bridget, abbess of Kildare, was foundress enlisted the fervour of her sex, and had followers in Darlughdach, abbess of Kildare, who founded Abernethy, in Æbba at Coldingham, and in Hilda at Lindisfarne. It was a form of Christianity fitted to excite the wonder and gain the affection of the heathen amongst whom the monks came, practising as well as preaching the self-denying doctrine of the cross. The religion of the Celts is a shadowy outline on the page of history. Notices of idols are rare. They had not the art necessary for an ideal representation of the human form, though they learnt to decorate the rude stone monuments of an earlier age with elaborate tracery. They had no temples. The mysterious circles of massive stones, with no covering but the heavens, may have served for places of worship, as well as memorials of the more illustrious dead. The names of gods are conspicuously absent, though antiquaries trace the worship of the Sun in the Beltane fires and other rites; but in the account of their adversaries we read of demons whom they invoked. Divination by rods or twigs, incantations or spells, strange rites connected with the elements of water and of fire, "choice of weather, lucky times, the watching of the voice of birds," are mentioned as amongst the practices of the Druids, a priestly caste revered for superior learning and, if we may accept Cæsar as an authority, highly educated. This, rather than fetish or animal worship, appears to have been their cult. It was, so far as scanty indications allow a generalization, by an empirical knowledge of the minor and secondary rather than the greater phenomena of nature that the Druids of Britain and Ireland exercised influence,—the tempest and its elements—wind and rain and snow, thunder and lightning—rather than the sun, moon, and stars. Whatever its precise form, this religion made a feeble resistance to the Christian, taught by the monks, with learning drawn from Scripture and some acquaintance with Latin as well as Christian literature, and enforced by the example of a pure life and the hope of a future world. The charms of music and poetry, in which the Celt delighted, were turned to sacred use. Columba was a protector of the bards,—himself a bard.

"It is not with the 'screod' our destiny is,
Nor with the bird on the top of the twig,
Nor with the trunk of a knotted tree,
Nor with a 'seadan' hand in hand.

I adore not the voice of birds,
Nor the 'screod' nor destiny nor lots in this world,
Nor a son nor chance nor woman;
My Druid is Christ the Son of God,
Christ, Son of Mary, the Great Abbot,
The Father, the Son, and the Holy Ghost."

Adamnan relates miracles of Columba scarcely above the level of the practices of the Druids. But superstition is not vanquished by superstition. Celibacy was a protest against the promiscuous intercourse for which Christian fathers condemn the Celts. Fasts and vigils contrasted with the gross, perhaps cannibal, practices still in use. The intense faith in Christ, of lives such as Patrick's and Columba's, won the victory of the cross.

When we pass to civil history our knowledge is restricted 597-685. to a list of names and battles; but the labours of recent scholars allow a brief account of the Celtic races from the end of the 6th to their union in the middle of the 9th century, in part hypothetical, yet a great advance on the absolute blank which made historians of the 18th century decline the task in despair.

The Britons, whose chief king had ruled at Alclyde, Britons were separated from their fellow-countrymen, the Cymry in of Strathclyde. Wales, shortly after Columba's death by the rapid advance of the Anglian kingdom of Northumberland, founded in the middle of the 6th century by Ida of Bamborough. One of his successors, Ethelfred, struck the blow, completed by the wars of the next king, Edwin, which severed modern Wales from British Cumbria and Strathclyde. Even Mona, the holy isle of both heathen and Christian Britons, became Anglesey, the island of the Angles. A later incursion towards the end of the century reached Carlisle and separated the kingdom of Alclyde, which had for its boundary the Catrail or Picts' trench between Peel Fell and Galashiels, from English Cumbria (Cumberland south of the Solway), and reduced for a short time Strathclyde to a subject province. When Bede wrote in 731 an Anglian bishopric had been established at Whitthorn, which continued till 803. The decline of the Northumbrian kingdom in the 8th century enabled the kings of Strathclyde to reassert their independence and maintain their rule within a restricted district more nearly answering to the valley of the Clyde, and in Galloway, in which there are some faint indications of a Pictish population, till it was united to the kingdom of Scone by the election of Donald, brother of Constantine II., king of the Scots, to its throne.

Of the Scots of Dalriada somewhat more is known. Their history is interwoven with that of the Picts and meets at many points that of the Angles of Northumberland, who during the 7th and the beginning of the 8th century, when their kings were the greatest in Britain, endeavoured to push their boundaries beyond the Forth and the Clyde. The history of this kingdom—see NORTH-UMBRIAN (KINGDOM OF)—forms part of that of Scotland during these centuries. It planted in Lothian (q.v.) the seed from which the civilization of Scotland grew. To an early period of the contest between the Angles and the Britons, and to the country between the Forth and the Tweed and Solway, perhaps belong the battles magnified by successive poets who celebrated the hero of British mediæval romance. Whether these battles were really fought in southern Scotland and on the borders, and Arthur's Seat was one of his strongholds, still "unknown is the grave of Arthur." Before Edwin's death (633) his kingdom extended to the Forth, and the future capital of Scotland received the name of Edwinstown from him in place of the Mynydd Agned and Dunedin of the British and Gaelic Celts. During the reign of Oswald (635-642) the Northumbrians were reconverted by Aidan, a monk whom Oswald summoned from Iona, and who became monastic bishop of Lindisfarne—a southern Iona—from which the Celtic form of the Christian church spread amongst the Angles of the north and east of England, until the council of Whitby and the election of Wilfrid to the see of York restored the Roman ritual and diocesan episcopacy, when Colman, their Celtic bishop at Lindisfarne, retired with his monks to Iona. Oswald's brother Oswy extended the dominion of Northumberland over a portion of the country of the northern Picts beyond the Forth. In his reign lived CUTHBERT (q.v.), the apostle of Lothian, where the monastery of St Æbba at Coldingham, the church on the Bass, the three churches of St Baldred at Auldham, Tynninghame, and Preston, and the sanctuary of Wedale (Stow) kept alive the memory of the Celtic Church. His name

685-756. is preserved in St Cuthbert's church at Edinburgh and in Kirkcudbright. To the same period belong two inscriptions, the earliest records of Anglian speech, one on the cross of Bewcastle in Cumberland, commemorating Alfred, a son of Oswy, the other, taken perhaps from a poem of Cædmon, at Ruthwell in Dumfries. Neither the Tweed nor the Solway was at this period a line of division. Oswy was succeeded by his son Egfrid (685), against whom the Picts successfully rebelled; and the Scots and a considerable part of the Britons also recovered their freedom. Anglian bishops, however, continued to hold the see of Whithorn during the whole of the 8th century. The Northumbrian kings, more successful in the west than in the east, gradually advanced from Carlisle along the coast of Ayr, and even took Alclyde. In what is now England their power declined from the middle of the 8th century before the rise of Mercia. Shortly before the commencement of the 9th century the descents of the Danes began, which led to the conflict for England between them and the Saxons of Wessex. The success of the latter under Alfred and his descendants transferred the supremacy to the princes of the southern kingdom, who, gradually advancing northwards, before the close of that century united all England under their sceptre.

Before its fall Northumberland produced three great men, the founders of English literature and learning, though two of them wrote chiefly in Latin,—Cædmon, the monk of Whitby, the first English poet; Bede, the monk of Jarrow, the first English historian; and Alcuin, the monk of York, whose school might have become the first English university, had he not lived in the decline of Northumbrian greatness and been attracted to the court of Charlemagne. It is to this early dawn of talent among the Angles of Northumberland that England owes its name of the land of the Angles and its language that of English. The northern dialect spoken by the Angles was the speech of Lothian, north as well as south (in Northumberland) of the Tweed, and was preserved in the broad Scotch of the Lowlands, while modern English was formed from the southern dialect of Alfred, Chaucer, and Wycliffe. This early Teutonic civilization of the lowland district of Scotland, in spite of the Danish wars, the Celtic conquest, and border feuds, never died out, and it became at a later time the centre from which the Anglo-Saxon character permeated the whole of Scotland, without suppressing, as in England, the Celtic. Their union, more or less complete in different districts, is, after the difference in the extent of the Roman conquest, the second main fact of Scottish history, distinguishing it from that of England. Both, to a great degree, were the result of physical geography. The mountains and arms of the sea repelled invaders and preserved longer the ancient race and its customs.

It is necessary, before tracing the causes which led to the union of races in Scotland, to form some notion of northern Scotland during the century preceding Kenneth Macalpine, during which—the light of Adamnan and Bede being withdrawn—we are left to the guidance of the Pictish *Chronicle* and the Irish *Annals*. The Picts whom Columba converted appear to have been consolidated under a single monarch. Brude, the son of Mailochon, ruled from Inverness to Iona on the west and on the north to the Orkneys. A sub-king or chief from these islands appears at his court. The absence of any other Pictish king, the reception of the Columbite mission in Buchan under Drostan, a disciple of Columba, and perhaps Columba himself, the foundation of the church of Mortlach near Aberdeen by Machar, another of his disciples, favour the conclusion that the dominion of Brude included Aberdeen as well as Moray and Ross. Its southern limits are unknown.

The Picts¹ of Stirling, Perth, and Forfar, corresponding to Strathearn and Menteith,—Athole and Gowrie, Angus and Mearns, had been already converted by Ninian in the 5th century—may have already come under a single king ruling perhaps at Abernethy, with mormaers under him. It seems certain that Abernethy was earlier than Dunkeld a centre of the Celtic Church distinct from Iona, and the seat of the first three bishops of Scotland. Its round tower cannot be safely ascribed to an earlier date than the 9th century, but may have been preceded by a church dedicated to St Bridget either in the 5th by Nechtan Morbet, or in the 6th century by Garnard, son of Donald, a later Pictish king. Although there exists a complete list of the Pictish kings from Brude, son of Mailochon, to Brude, son of Ferat, conquered by Kenneth Macalpine, and of the Scots of Dalriada from Aidan (converted by Columba) to Kenneth Macalpine, with their regnal years, it is only here and there that a figure emerges sufficiently distinct to enter history. Parts of these lists are fictitious and others doubtful, nor do we know over what extent of country the various monarchs ruled. Of the figures more or less prominent amongst the Pictish kings are Brude, the son of Derili, the contemporary of Adamnan, who was present at the synod of Tara when the law called Kain Adamnan, freeing women from military service, was adopted, and who died in 706, being then styled king of Fortren. Nechtan, another son of Derili, was the contemporary of Bede, who gives (710) the letter of Ceolfrid, abbot of Wearmouth, to him when he adopted the Roman Easter and the tonsure. Six years later Nechtan expelled the Columbite monks from his dominions. They retired to Dalriada, as their brethren in Northumberland had done when a similar change was made by Oswy. Nechtan also asked for masons to build a church in the Roman style, to be dedicated to St Peter, and several churches in honour of that apostle were founded within his territory. Shortly after, Egbert, an Anglian monk, persuaded the community of Hy (Iona) itself to conform, but too late to lead to the union of the churches of the Scots and the Picts, which were separated also by political causes.

Fifteen years later the greatest Pictish monarch, Angus MacFergus, after a contest with more than one rival, gained the supremacy, which he held for thirty years (731-761). In revenge for the capture of his son Brude by Dungal, son of Selvach, king of the Dalriad Scots, he attacked Argyll, and laid waste the whole country, destroying Dunnad (? on Loch Crinan), then the capital, burnt Creich (in Mull), and put in chains Dungal and Feradach, the sons of Selvach. He next conquered (739), and it is said drowned, Talorgan, son of Drostan, king of Athole, one of his rivals, and, resuming the Dalriad war, reduced the whole of the western Highlands. The Britons of Strathclyde were assailed by a brother of Angus, who

¹ But there had been a time when not one but several Pictish kings ruled the northern and central districts of Scotland, and of this we have perhaps a trace in the Pictish legend according to which Cruithne, the eponymus of the race, had seven sons,—Cait, Cee, Ciric, Fib, Fidach, Fotla, Fortren. Conjecture identifies five of these names with districts known in later history,—Cait with Caithness, Ciric with Mearns (Magh Circeen, the plain of Ciric), Fib with Fife, Fotla with Athole (Athfotla), Fortren with southern Perthshire, connecting it with a division of the same county in a tract of the 12th century. (Comp. plate VI.) Six of the divisions—Angus and Mearns, Athole and Gowrie, Strathearn and Menteith, Fife and Fortreive, Mar and Buchan, Moray and Ross—fairly correspond to districts afterwards ruled by the Celtic mormaers of Angus, Athole, Strathearn, Fife, Mar, and Moray; Caithness in the 9th century became Norse, and a new earl (of March) was introduced from the south of the Forth. They correspond also to seven great earldoms of Scotland, which appear with more or less distinctness on several occasions in the reigns of the Alexanders. This, at least, is a highly ingenious theory, but not certain history.

fell in battle at Mugdoch in Stirling; and Angus, with his ally Eadbert, king of Northumberland, retaliated by burning Alclyde (756). About this time (752) Coilin Droichteach (the Bridgemaker), abbot of Iona, removed most of the relics of his abbey to Ireland, and this is the most probable date of the legend of the relics of St Andrew being brought from Patras to St Andrews, where the sons of a Pictish king, Hungus (Angus MacFergus), who was absent in Argyll, or, according to another version, Hungus himself, dedicated Kilrighmont (St Andrews) and the district called the Boar's Chase to St Andrew. The ascription of the foundation to an earlier king of the same name in the 4th century was due to the wish to give the chief bishopric of Scotland an antiquity greater than Iona and Glasgow, greater even than Canterbury and York. After the death of Angus MacFergus no king is connected with any event of importance except Constantine, son of Fergus (died 820), who is said to have founded the church of Dunkeld,—226 years after Garnard, son of Donald, founded Abernethy. This fact, though the earlier date is not certain, points to the Perthshire lowlands as having been for a long time the centre of the chief Pictish monarchy. Probably Scone was during this period, as it certainly became afterwards, the political capital; and the kings latterly are sometimes called kings of Fortren. If so, the chief monarchy under the pressure of the Norse attacks had passed south from Inverness, having occupied perhaps at various times, Dunottar, Brechin, Forfar, Forteviot, and Abernethy as strongholds; but it is not possible to say whether there may not have continued to be independent Pictish rulers in the north.

Early
annals of
Dalriad
Scots.

The annals of Dalriada are even more perplexing than those of the Picts after the middle of the 6th century. There is the usual list of kings, but they are too numerous, and their reigns are calculated on an artificial system. The forty kings from Fergus MacEarc to Fergus MacFerchard, who would carry the date of the Scottish settlement back to three centuries at least before the birth of Christ, have been driven from the pale of history by modern criticism. The date of the true settlement was that of the later Fergus, the son of Earc, in 503. From that date down to Selvach, the king who was conquered by Angus MacFergus about 730, the names of the kings can be given with reasonable certainty from Adamnan, Bede, and the Irish *Annals*. But the subsequent names in the Scottish chronicles are untrustworthy, and it is an ingenious conjecture that some may have been inserted to cover the century following 730, during which Dalriada is supposed to have continued under Pictish rule. This view is not free from its own difficulties. It is hard to explain how Kenneth Macalpine, called by all Scottish records a Scot, though in Irish *Annals* styled (as are several of his successors) king of the Picts, succeeded in reversing the conquest of Angus MacFergus and establishing a Scottish line on the throne of Scone, in the middle of the 9th century. This difficulty is supposed to be solved by the hypothesis that Kenneth was the son of a Pictish father, Alpine, but of a Scottish mother, and was entitled to the crown by a peculiarity of Pictish law, which recognized descent by the mother as the test of legitimacy. The records which speak of the destruction of the Picts are treated as later inventions, and it is even doubted whether the connexion between Alpine and Kenneth and the older race of Dalriad kings is not fictitious.¹

¹ The above statement is a brief outline of the reconstruction of this period of Scottish history due to two scholars who have done more than any others to elucidate it, Father Innes and Mr Skene. Their negative criticism, which destroys the fabric reared by a succession of historians from Fordun or his continuator Bowmaker to Buchanan, is a masterly work, not likely to be superseded. Whether the constructive part will stand is not certain, but it explains many of the facts.

Whatever may be the solution ultimately reached as to Kenneth Macalpine's antecedents, his accession represents a revolution which led by degrees to a complete union of the Picts and Scots and the establishment of one kingdom—at first called Albania and afterwards Scotia—which included all Scotland north of the Forth and Clyde, except Caithness, Sutherland, Orkney and Shetland (the northern isles or Nordreyar), the Hebrides (the southern isles or Sudreyar), and Man; these fell for a time into the hands of the Norsemen. This revolution had two causes or concomitants, one religious and the other political. Kenneth Macalpine in the seventh year of his reign (851) brought the relics of St Columba from Iona to a church he built at Dunkeld, and on his death he was buried at Iona. A little earlier the Irish Culdees, then in their first vigour, received their earliest grant in Scotland at Loch Leven from Brude, one of the last kings of the Picts, and soon found their way into all the principal Columbite monasteries, of which they represent a reform. The Irish monastic system did not yet give place to the Roman form of diocesan episcopacy. The abbot of Dunkeld succeeded to the position of the abbot of Iona and held it until the beginning of the 10th century, giving ecclesiastical sanction to the sovereign at Scone, as Columba had done in the case of Aidan. As early as the beginning of the 8th century, however, a Pictish bishop of Scotland appears at a council of Rome, and he had at least two successors as sole bishops or primates of the Celtic Church before dioceses were formed. Scotland north of the firths thus remained at a lower stage of church organization than England, where a complete system of dioceses had been established in great part answering to the original Anglo-Saxon kingdoms or their divisions, with Canterbury and York at their head as rivals for the primacy. But the Celtic clergy who now conformed to the Roman ritual preserved some knowledge of the Latin language, and a connexion with Rome as the centre of Latin Christianity, which was certain to result in the adoption of the form of church government now almost universal. The other circumstance which had a powerful influence on the foundation of the monarchy of Scone and the consolidation of the Celtic tribes was the descent on all the coasts of Britain and Ireland of the Norse and Danish vikings. The Danes chiefly attacked England from Viking Northumberland and along the whole east and part of the southern seaboard; the Norsemen attacked Scotland, especially the islands and the north and west coasts, going as far south as the Isle of Man and the east and south of Ireland. It had now become essential to the existence of a Scottish Celtic kingdom that its centre should be removed farther inland. Argyll and the Isles, including Iona, were in the path of danger. No monk would have now chosen island homes for safety. In 787 the first arrival of the viking ships is noticed in the *Anglo-Saxon Chronicle*. Some years later the Irish *Annals* mention that all "the islands of Britain were wasted and much harassed by the Danes." Amongst these were Lindisfarne, Rathlin off Antrim, Iona (794), and Patrick's island near Dublin (798). Iona was thrice plundered between 802 and 826, when Blathmac, an abbot, was killed. A poem composed not long after the event states that the shrine of Columba was one of the objects in search of which the Norsemen came, and that it was concealed by the monks. It was to preserve the relics from this fate that some of them were transferred by Droichteach, the last abbot, to Ireland and others by Kenneth to Dunkeld. For half a century the vikings were content with plunder, but in the middle of the 9th they began to form settlements. In 849 Olaf the White established himself at Dublin as king of Húi Ivar; in 867 a Danish kingdom was set up in Northumberland;

867-914. and Harold the Fairhaired, who in 872 became sole king of Norway, soon after led an expedition against the vikings, who had already seized Orkney and Shetland, and established an earldom under Rognwald, earl of Moeri, whose son Hrolf the Ganger conquered Normandy in the beginning of the next century. The position of Scotland, therefore, when Kenneth united the Picts and Scots was this: central Scotland from sea to sea—Argyll and the Isles, Perthshire, Angus and Mearns, and Fife—was under the dominion of the king who had Scone for his capital; the south-west district—the valley of the Clyde, Ayr, Dumfries, and Galloway—was under a British king at Dumbarton; the south-east district or Lothian was part of “Saxon or Sassenach Land,”—the general Celtic name for the country of the Anglo-Saxons, but now owing to the divided state of Northumberland held by different lords; the north of Scotland was under independent Celtic chiefs, as Moray and Mar, or already occupied by Norsemen, as Caithness, Orkney and Shetland, and the Hebrides. The whole Celtic population was Christian; but the Norse invaders were still heathen. Their religion was similar to that of their Anglo-Saxon kin, of a type higher than the paganism of the Celts. It resembled the Celtic indeed in the absence or infrequency of idols, but a complex mythology peopled heaven with gods—Woden and Thor, Freya and Balder, and others of inferior rank—devised legends of the origin of earth and man, Valhalla the hero's paradise, and a shadowy hell for all who were not heroes. Some of its legends are coloured from Christian sources, and underneath the mythology may be detected a ruder and more ancient superstitious belief in omens and divination,—a nature-worship more like that of the Celts. But it is the later form which represents the Norse character as it was when it came into contact with the nations of Britain,—its daring defiance of man and the gods, its struggle with, yet in the end its calm acceptance of, the decrees of fate. The Norsemen both at home and in their colonies in Scotland embraced Christianity under Olaf Tryggvason in the end of the 10th century; but along with Christianity they retained the old heathen sentiments and customs, which, like their language, mingled with and modified the Celtic character on the western but far more on the northern coasts and islands, where the population was largely Norse. A strain neither Celtic nor Teutonic nor Norman occasionally meets us in Scottish history: it is derived from the blood or memory of the Norse vikings.

3. *Later Celtic Period: Growth of the Kingdom of Scone from Kenneth Macalpine to Malcolm Canmore.*—During this period, though the Celtic annals are still obscure, we can trace the united Celtic kingdom growing on all sides under Kenneth's successors,—southward by the conquest of Lothian on the east and by the union of the Strathclyde kingdom on the west, and for a time by holding English Cumbria under the English kings, and northward by the gradual incorporation of Angus, Mearns, Moray, and possibly the southern district of Aberdeen. Kenneth Macalpine's reign of sixteen years (844-860) was a time of incessant war. He invaded Saxony (Lothian) six times, burnt Dunbar, and seized Melrose (already a rich abbey, though on a different site from the Cistercian foundation of David I.), while the Britons (of Strathclyde) burnt Dunblane and the Danes wasted the land of the Picts as far as Cluny and Dunkeld. After they left Kenneth rebuilt the church of Dunkeld and replaced in it Columba's relics. He died at Forteviot and was buried at Iona.

Donald I. He was succeeded by his brother Donald I. (861-863), who, with his people the Gaels, established the laws of Aed, son of Eachdach, at Forteviot. Aed was a Dalriad king of the 8th century; but the contents of his laws are unknown.

Perhaps tanistry, by which the successor to the king was elected during his life from the eldest and worthiest of his kin, usually a collateral in preference to a descendant, was one feature, for it certainly prevailed amongst the Irish and Scottish Gaels. The next king, who succeeded in accordance with that custom, was Constantine I. (863-Constantine I. 877), son of Kenneth. His reign was occupied with conflicts with the Norsemen. Olaf the White, the Norse king of Dublin, laid waste the country of the Picts and Britons year after year, and in 870 reduced Alclyde, the British capital; but, as he disappears from history, he probably fell in a subsequent raid. He is said to have married a daughter of Kenneth, and some claim in her right may account for his Scottish wars. In the south the Danish leader Halfdan devastated Northumberland and Galloway; while in the north Thorsten the Red—a son of Olaf by Audur, the wealthy daughter of Ketil Flatnose (called Finn, “the Fair,” by the Celts), a Norse viking of the Hebrides, who afterwards went to Iceland and figures in the sagas—conquered the coast of Caithness and Sutherland as far as Ekkials Bakki (the Oikel). But he was killed in the following year. Constantine met with the same fate at a battle at Inverdoval in Fife in 877, at the hands of another band of northern marauders. His death led to a disputed succession. His heir, according to the custom of tanistry, was his brother Aodh, who was killed by his own people after a year. Eocha, the son of Run, a king of the Britons, claimed in right of his mother, a daughter of Kenneth, according to the Pictish law, and governed at first along with Ciric or Grig, his tutor; then Grig ruled alone, until they were both expelled from the kingdom and Donald II., son of Constantine, came to the throne (889). The Pictish *Chronicle* reports that during the government of Grig the Scottish Church was freed from subjection to the laws of the Picts (meaning probably from liability to secular service). Grig is also said to have subdued all Bernicia and “almost Anglia,” a statement which if confined to the north of the Northumbrian kingdom is not improbable, for it had then fallen into anarchy through the attacks of the Danes. The church of Ecclesgreig near Montrose possibly commemorates Grig and indicates the northward extension of the monarchy of Scone. In the reign of Donald II. (889-900), son of Donald Constantine I., Scotland was again attacked by the Norsemen. Sigurd, the Norse earl of Orkney, seized Caithness, Sutherland, Ross, and part of Moray, where he built the fort of Burghead, between the Findhorn and the Spey. Farther south the Danes took Dunnottar, where Donald was slain. After his time the name of the kingdom of Scone was no longer Pictavia, but Albania or Alba, a more ancient title of northern Scotland, perhaps resumed to mark the growth of the Scottish-Pictish monarchy in the central and eastern Highlands.

Donald II. was followed by Constantine II. (900-940), Constantine II. son of Aodh and grandson of Kenneth, and his long reign is a proof of his power. He was the greatest Scottish king, as Angus MacFergus had been the greatest of the pure Pictish race. In the first part of it his kingdom was still beset by the Norsemen. In his third year they wasted Dunkeld and all Alba. Next year they were repulsed in Strathearn. In his 8th year Rognwald, the Danish king of Dublin, with earls Ottir and Oswle Crakaban, ravaged Dunblane. Six years later the same leaders were defeated on the Tyne (? in East Lothian) by Constantine, who had been summoned to assist Eldred, lord of Bamborough. Ottir was slain, but Rognwald escaped and reappears some years later as king of Northumberland. This is a battle whose site and incidents are told in a conflicting manner by different chronicles; but it appears certain that Constantine saved his dominions from further

alpine.

serious attacks by the vikings. He had now to meet a more formidable foe,—the West Saxons, whose kings, the descendants of Alfred, were steadily moving northwards. In spite of his wars, Constantine found time in the early part of his reign for two important reforms,—one ecclesiastical, the other civil. In his sixth year (906) he, along with Cellach, bishop of St Andrews—the first of twelve Celtic bishops of Scotland—swore on the Hill of Faith at Scone (906) that “the laws and discipline of the faith, and the rights of the churches and the gospel, should be preserved on an equal footing with the Scots.” This obscure notice of the Pictish *Chronicle* indicates the establishment or restoration of the Scottish Church, which the Pictish kings had oppressed, to an equality with that of the Pictish. As a sign of the union the crozier of St Columba, called Cathbuadh (“victory in battle”), was borne before Constantine’s armies. Two years later, on the death of Donald, king of the Britons of Strathclyde, Constantine procured the election of his own brother Donald to that kingdom. Though he thus strengthened church and state, Alfred’s successors were too powerful for him. The *Anglo-Saxon Chronicle* records of Edward the Elder, that in 924, having built a fort at Bakewell, in the Peak of Derbyshire, “the king and nation of the Scots, Rognwald the Northumbrian and others, and also the king of the Strathclyde Welsh and his people, chose him for father and lord.” His son Athelstan is related by the same authority to have subjugated all the kings in the island, amongst whom are mentioned by name Howell king of the west Welsh, Constantine king of the Scots, Owen king of Gwent, and Eldred of Bamborough, who “made peace with oaths at Emmet and renounced every kind of idolatry.” These entries are not beyond suspicion. The Peak was a distant point for the Scottish king. Rognwald, the Northumbrian, died in 920, according to the *Irish Annals*. Howell and Constantine were already Christians and could not have then renounced idolatry. If there is any truth in the submission of the Scots to Edward the Elder it did not last, for some years later the *Chronicle* states that Athelstan went into Scotland with a land and sea force and ravaged a great part of it. A league of the northern kings against Athelstan was dispersed (937) by his great victory at Brunanburgh (?Wendun, between Aldborough and Knaresborough, according to Skene). The forces allied against him were those of Constantine, his son-in-law Olaf, son of Sitric (called also the Red), and another Olaf, son of Godfrey, from Ireland, besides the Strathclyde and north Welsh kings. For Athelstan there fought, in addition to his own West Saxons, the Mercians and some mercenaries from Norway, amongst them Egil, son of Skalagrim, the hero of a famous Icelandic saga. No greater slaughter had been known since the Anglo-Saxons, “proud war-smiths,” as their poet calls them, overcame the Welsh and gained England. A son of Constantine was slain, four kings, and seven earls. Constantine himself escaped to Scotland, where in old age he resigned the crown for the tonsure and became abbot of the Culdees of St Andrews. Athelstan died two years after Brunanburgh, but before his death granted Northumberland to Erik Bloody-Axe, son of Harold Haarfagr, who was almost immediately expelled by the Irish Danes. Athelstan, even after so great a victory, could not annex Northumberland, much less Scotland, to his dominions.

Malcolm I. Constantine’s successor, Malcolm I. (943-954), son of Donald II., began his reign by invading Moray and killing Cellach, its chief king. Meantime the Danish kings of Dublin had been endeavouring to maintain their hold on Northumberland with the aid of the Cumbrians, whose country they had already settled, and in this attempt the two Olafs had a temporary success; but Eadmund, the

successor of Athelstan, expelled Olaf, son of Sitric, from 914-1014. Northumberland, and in the following year, to prevent the Cumbrians from again aiding the Danes, he “harried Cumberland and gave it all up to Malcolm, king of Scots, on condition that he should be his fellow-worker both on sea and land.” This was the same policy which led his father to call in the aid of Erik Bloody-Axe. The kings of Wessex wisely granted what they could not hold to the best northern warrior, Celt or Scandinavian, under conditions which acknowledged more or less strictly their supremacy. The Cumbria so granted was the country south of the Solway to the Dee, but it may also have included Strathclyde, for at this period Strathclyde Waelas and Cumbrians are frequently used as equivalent names. Malcolm lent no aid to Erik Bloody-Axe, when in the reign of Eadred he tried (949) to recover Northumberland, but he joined his brother-in-law Olaf, Sitric’s son, in an expedition with the same object, when they laid waste the country as far south as the Tees. Three years later Erik again returned, and finally drove Olaf back to Ireland, where he founded the kingdom of Dublin, which lasted till the battle of Clontarf. Malcolm died fighting either against the men of Mearns or of Moray. Three kings followed (954-971),—Indulf, son of Constantine, Duff, son of Malcolm, Colin, son of Indulf; in the reign of Indulf the Northumbrians evacuated Edinburgh, which thenceforward was Scottish ground. A Saxon burgh, a fort, perhaps a town, was now for the first time within the Celtic kingdom.

Kenneth II. (971-995), son of Malcolm, soon after his accession made a raid on Northumberland as far south as II. Cleveland. The statement of two English chroniclers (John of Wallingford and Henry of Huntingdon), that Lothian was ceded to him by Eadgar on condition of homage, and that the people should still use the language of the Angles, is not mentioned in the Anglo-Saxon or any Scottish chronicle. Nor is it easy to believe the *Anglo-Saxon Chronicle* as amplified by Florence of Worcester, that Kenneth was one of the kings who rowed Eadgar on the Dee in sign of homage. At this time, in the north and west, the Orkney earls were all-powerful, and Kenneth was occupied with contests nearer his own territory,—especially with the mormaer of Angus, whose grandson, through his daughter Fenella, he slew at Dunsinane, and in revenge for which he was himself treacherously killed at Fettercairn in Mearns by Fenella, whose name is still preserved in the traditions of that district. The foundation of the church at Brechin is attributed to this king.

Kenneth was followed, as he had been preceded, by insignificant kings,—Constantine, son of Colin, and Kenneth, son of Duff. His son, Malcolm II. (1005-34), gained the throne by the slaughter of his predecessor Duff at II. Monzievaird, and at once turned his arms southwards; but his first attempt to conquer northern Northumberland was repelled by Ethelred, son of Waltheof, its earl, who defeated him at Durham. About the same time Sigurd, earl of Orkney, having defeated Finlay, mormaer of Moray, became ruler, according to the Norse saga, of “Ross and Moray, Sutherland and the dales” of Caithness. He had conflicts with other Scottish chiefs, but appears to have made terms with the kings of both Norway and Scotland, —with Olaf Tryggvason by becoming Christian and with Malcolm by marrying his daughter. He fell at Clontarf (1014), the memorable battle near Dublin, by which Brian Boru and his son Murcadh defeated the Danish kings in Ireland and restored a Celtic dynasty. Malcolm conferred the earldom of Caithness on his grandson Thorfinn, the infant son of Sigurd; and Sigurd’s Orkney earldom fell to his sons, Somerled, Brusi, and Einar; while Moray again

1014-1058. came into the possession of a Celtic mormaer, Finlay, who is called king of Alba by one of the Irish chronicles, and the Hebrides probably into that of a Norse earl, Gilli, from whom they were afterwards recovered by Thorfinn. While the Celts of Ireland were thus expelling the Danish invaders and in Scotland there was divided possession, the result of compromise and of intermarriage, England fell under the dominion of the Danish kings Sweyn and Canute. Canute committed Northumberland to Erik, a Dane, as earl; but Eadulf Cudel, a weak brother of the brave Oswulf and son of Waltheof, the Anglian earl, still retained the northern district as lord of Bamborough. Profiting by the distracted state of northern England, Malcolm again invaded Northumberland with Owen of Cumbria, called the Bald, and by the victory of Carham (1018) near Coldstream won Lothian, which remained from that time an integral part of Scotland. Canute, on his return from a pilgrimage to Rome, is said by the *Anglo-Saxon Chronicle* to have gone to Scotland, where Malcolm and two other kings, Maelbeth and Jehmarc, submitted to him, but he held Scotland for only a little while. Maelbeth is supposed to be Macbeth, then mormaer of Moray, afterwards king, and Jehmarc, a Celtic or Scandinavian chief in Argyll. The hold which Canute, who was trying to grasp Norway and Denmark as well as England, had upon northern Britain must have been slender as well as short; but the acknowledgment of the supremacy of so great a king was natural. At his death his overgrown empire fell to pieces, and Scotland was left to itself. Two years before Malcolm II. died. His conquest of Lothian perhaps led to the new name of Scotia (now generally applied to his kingdom), which was to become its permanent name. *The Scotland he governed still had its centre at Scone, but included besides the original Pictish district of Perthshire, Angus and Mearns, Fife, the southern district of Aberdeen, and Lothian, his own conquest, while Moray and western Ross, and perhaps Argyll and the Isles, owned his suzerainty. But the Norse earl, Thorfinn, at this time held the Orkneys, Caithness, Sutherland, and the Hebrides. Whether a Cumbrian king still ruled Strathclyde and Galloway is doubtful. After Owen the Bald, who fought at Carham, the next king mentioned is Duncan, son of the grandson and the successor of Malcolm. Malcolm II. was liberal to the church, as we know from his gifts to the church of Deer; but the foundation of Mortlach (Banffshire), the future see of Aberdeen, belongs to the reign of Malcolm Canmore. The laws attributed to him are spurious, introducing into the Celtic kingdom a fully developed feudalism, which was not known in England, still less in Scotland, till after the Conquest. As he left no male heir, Malcolm's death led to a doubtful succession and a perplexed period of Scottish history.

The Scottish historians and the Norse sagas can with difficulty be reconciled. Little light can be got from either the *Anglo-Saxon Chronicle* or the *Irish Annals*. Shakespeare seized the weird story of Macbeth, as told by Boece and translated in Holinshed, and history can hardly displace the tragedy, so true to the dark side of human nature, by the meagre outline at its command. This outline is supported by authentic evidence, and agrees with the situation which existed between the death of Malcolm II. and the accession of Malcolm Canmore.

Duncan. Malcolm II. was succeeded by his grandson Duncan (1034-40), son of his daughter Bethoc and Crinan, a lay or secular abbot of Dunkeld; but his right was probably from the first contested by Thorfinn, who had become the most powerful of the Norse earls. If the Orkney saga could be relied upon, he had as many as eleven earls or mormaers subject to him, and a modern but unsafe in-

terpretation of one passage extends his dominion as far as Galloway. Duncan, after an unsuccessful attempt on Durham, turned his arms to the north to check the further advance of his kinsman, but was defeated on the Pentland Firth. Moddan, whom he had tried to set up as earl of Caithness, was burnt in his own house, and Duncan himself was killed at Bothgownan near Elgin by Macbeth, his own general. Macbeth was son of Finlay, mormaer of Macbeth, Moray, and his wife Gruoch was daughter of Boete, son of Kenneth II.; thus he had a possible pretension to the crown if it could descend by females. But his real position appears to have been that of a successful general asserting the independence of the northern Celts against Duncan, who by his marriage with the daughter of Earl Siward, the Northumbrian earl, had shown the tendency to unite Saxon with Celtic blood which was followed by his son Malcolm (III.) Canmore. Macbeth reigned seventeen years (1040-57). He was, as far as records state, an able monarch, who succeeded in repelling the attacks of Siward on behalf of his grandson, who showed liberality to the church, as the foundation of himself and his wife at Loch Leven testifies, sent money for the poor to Rome, and possibly went with it on a pilgrimage; but he fell at last in the battle of Lumphanan in Mar, where the young Malcolm was aided by Tostig, son of Godwine, the great West Saxon earl who had become earl of Northumberland. A few months later, Lulach, the son of Gillecomhain, a former mormaer of Moray, who had continued the war, and is nominally counted a king, though called fatuous, was slain at Essie in Strathbogie (N.W. Aberdeen), and Malcolm Canmore became king. With his reign a new and clearer era of the history of Scotland commences.

The Scottish Gaels had proved themselves capable of government. The united monarchy of Scone lasted for two centuries in archy of spite of its powerful neighbours, but it was dependent almost Scone. entirely on the attachment of the clans to their chiefs and of the whole race to the hereditary king. It was traditional, not constitutional, with some accepted customs, otherwise it could not have held together, but with little settled law and no local government. It wanted the elements of civil life, for it had no organized towns or assemblies of the people. There was little commerce or trade. Cattle and sheep were the chief commodities and the medium of exchange. There is no trace of an independent coinage. Christianity had not yet leavened the whole population, though the monasteries were centres of light within limited circles. The Celtic character, alien to set and quick forms of business, was Celtic alive to the pleasures of the imagination, oratory, and song. Its cardinal defect was a light regard for truth. Its chief virtue was Anglo-devotion to a leader, whether priest, chief, or king. The Christian Saxon Anglo-Saxons of the Lothians, the Norsemen, only recently and character. half converted, in the islands of the north and west, brought qualities and customs into the common stock of the future Scottish people which were wanting to the Celts. The Anglo-Saxon in his original home, as in Britain the inhabitant of the plain—"the creeping Saxon," as he was called by an Irish bard—developed in the house and the town a better regulated freedom,—the domestic and civic virtues. His imagination, even his poetry, had a touch of prose, but he possessed the prosaic qualities of plain speech, common sense, and truth,—the essence of trust. The contact—for it was a contact, not a conquest—with this race was of the highest value to the Scottish nation of the future. The Normans introduced new elements, the spirit of chivalry and the too rigid bonds of the feudal law. The changes due to these new elements began in Scotland in the reign of Malcolm Canmore, and were completed in those of his descendants. The Scottish Celtic kingdom became gradually civilized under Saxon and Norman influences, while retaining its native vigour. The result was the establishment of the independence of Scotland within its present bounds during the prosperous reigns of the Alexanders (1107-1285).

4. *Transition from a Celtic to an Anglo-Norman Feudal* Malcolm Morarchy: Malcolm Canmore and his Descendants.—III. Canmore. Malcolm Canmore (1058-93) spent his boyhood in Cumbria, his youth at the court of Edward the Confessor of England. He was by race only half a Celt, for his mother was an Anglo-Dane, sister of Earl Siward. The court which helped to form his character was already sub-

ject to Norman influence. The Confessor, like Canmore, had been educated in exile, at the Norman court, and favoured the Normans. Though the course of events led Malcolm to ally himself with the Anglo-Saxon royal house, the Anglo-Saxon and Anglo-Norman periods of Scottish history were not, as in England, separated by several centuries, but were nearly contemporaneous. If Malcolm, Edgar, and the first Alexander may be regarded as Scoto-Saxon, David I. and his successors were truly Scoto-Norman feudal monarchs. Apart from the customs and language of Lothian, which descended from Anglian Northumberland, Scotland received scarcely any pure Saxon institutions. Those it did receive have a mixed Saxon and Norman imprint. There were no tithings, wapentakes, or hundreds, no trial by compurgation, no frankpledge. No witenagemot or folknotes preceded the great council which became parliament. In short, the system of government we call the Anglo-Saxon constitution never existed in Scotland, although the court of the four southern burghs and the customs of the towns of Lothian copied from those of Newcastle, and a similar association of burghs, the Hanse of Aberdeen, of which there are faint traces in the north, had a Teutonic origin. And some traces of Anglo-Saxon criminal law are to be found in the early Scottish charters.

Canmore ascended the throne (1058) not long before England was subjugated by William the Conqueror. The only recorded event of his reign prior to the Conquest was his quarrel with Tostig, his "sworn" brother, when he made a raid south of the Tweed and violated the peace of St Cuthbert by ravaging Lindisfarne. The early years of his reign were devoted to establishing his rule in the northern districts, where his marriage to Ingebiorg, widow of Earl Thorfinn, related by the Norse but not the Scottish writers, may have aided him. Ingebiorg, already old, cannot have long survived the union, nor is the fact of the marriage certain. The victory of Hastings brought to the Scottish court as refugees Edgar Atheling, grandson of Edmund Ironside, and his three sisters. Their father, Edward, had found shelter in Hungary in the reign of Canute and married an Hungarian princess. The eldest daughter of the marriage, Margaret, became the wife (1068) of Malcolm Canmore. Her virtues more than his wars make his reign an epoch of Scottish history. This alliance and the advance of the Conqueror on Northumberland in the third year of his reign rendered a collision inevitable. Malcolm twice harried Northumberland during the reign of the Conqueror with the view of restoring the Atheling. In the interval between these expeditions William retaliated by invading Scotland as far as Abernethy, where he forced Malcolm to do homage. After the second he sent his son Robert, who reached Falkirk; but he returned without having accomplished anything, except that he built Newcastle as a frontier fortress. In this reign Northumberland itself was never really subdued, and William laid waste the district between the Humber and the Tees as a barrier against the northern Angles and Danes. After the Conqueror's death Malcolm prepared for war, but peace was made before he had left Lothian, and he again took an oath of homage. Next year William Rufus succeeded in reducing Cumbria south of the Solway, then held by Dolphin, lord of Carlisle, a vassal of Malcolm, rebuilt the castle of Carlisle, and made the adjoining country for the first time English. He then summoned Malcolm to Gloucester; but the meeting ended, like others when a summons to do homage at a distance from the border was sent to the kings of Scotland, in settling both in a more hostile attitude. Malcolm on his return raised his whole forces for the last expedition of his life, in which he was slain (1093) in an ambush

near Alnwick by Morel of Bamborough. He left to his successor a kingdom bounded on the south by the Tweed, the Cheviots, and the Solway, though there was much debatable land along the borders, and the English king claimed Lothian as successor of the Northumbrian Angles, while the Scotch claimed English Cumberland as a dependency dating from the grant of Eadgar. Malcolm's defeat of the mother of Maelsnechtan, son of Lulach and mormaer of Moray, is the only event recorded to indicate that his relations with the Celtic population were not peaceful, but the materials are too scanty to make it clear how far the northern chiefs asserted their independence. The foundation of Mortlach by Malcolm is proof that the Aberdeen lowlands at least were within his dominion.

The brightest side of Malcolm's reign was the reform Margaret due to Margaret. Her life by Theodoric, a monk of Durham, or her confessor, Turgot, though coloured by partiality for a good woman, the patron of the church, bears the marks of a true portrait. The miraculous element in the lives of the Celtic saints, diminished but still present in Bede, disappears. The chief changes in the Celtic Church effected by Margaret with the aid of monks sent by Lanfranc from Canterbury were the observance of Lent, the reception of the Eucharist at Easter, which had fallen into neglect, the use of the proper ritual in the mass, the prohibition of labour on the Lord's day, and of marriage between persons related by affinity. She restored Iona, long desecrated, founded the church of Dunfermline in commemoration of her marriage, and protected the hermits, still common in the Scottish Church. Her severe fasts and her liberality to the sick and aged are especially noted. She washed the feet of the poor and fed children with food she had prepared, procured freedom for captives, and on either side of the ferry called Queensferry after her she erected hostels for pilgrims. Nor did her piety lead her to neglect domestic duties. The rude manners of the Celtic court were refined by her example. The education of her children, her chief care in her husband's frequent absence, was rewarded by the noble character of the saintly David and the good Queen Maude. She did not long survive her husband: hearing of his death she thanked the Almighty for enabling her to bear such sorrow, to cleanse her from sin, and after receiving the sacrament died praying. The chapel on the castle rock at Edinburgh, erected in her memory, is the oldest building now existing in Scotland, with the exception of the meagre ruins of the Celtic Church in the western Highlands.

After Malcolm's death there was a fierce contest for the crown (1093-97), which showed that the union of Celtic and Saxon blood was not yet complete in the royal house, much less in the nation. Before the corpse of Margaret could be removed to Dunfermline for burial, Donald Bain, brother of Malcolm Canmore, besieged the castle, and its removal was only accomplished under cover of mist. Donald, who had the support of the Celts and the custom of tanistry in favour of his claim, was king nominally at least six months, when he was expelled by Duncan, son of Malcolm and Ingebiorg, assisted by an English force, in which there were Normans as well as Saxons; but his tenure was equally short, and Donald, aided by Edmund, the only degenerate son of Malcolm and Margaret, who slew his half-brother Duncan, again reigned three years. This was the last attempt of the Celts—though partial risings continued frequent—to maintain a king of their race and a kingdom governed according to their customs. Edgar Atheling, who had become reconciled to the Norman king, led an army into Scotland and by a hard-fought battle dispossessed Donald and restored his eldest nephew, Edgar, to his father's throne.

The reign of Edgar (1097-1107) was unimportant. Its

1097-1127. chief event was the cession of the Sudreyar or islands on the west coast to the Norse king Magnus Barefoot, who also conquered Man and Anglesea. The terms of the treaty which, after two expeditions, he extorted from Edgar were that every island was to be his between which and the mainland a helm-bearing ship could pass, and by carrying one across the mainland he included Cantyre. Magnus was killed in Ulster; but the Hebrides remained in the hands of the Norse kings or lords, and acknowledged their sway till the battle of Largs (1263). Their cession was the necessary price for the consolidation of the Scottish monarchy in the south of the kingdom. Edinburgh was the capital of Edgar, a circumstance which marked the removal of the centre of the kingdom to its southern and Saxon district. His standard had been blessed at Durham when he recovered the crown, and it was to Durham or Dunfermline, where he was buried, that his benefactions were made. Iona had passed into the hands of Magnus, but he, being a Christian, respected its sanctity. Scone was henceforth only the scene of the coronation ceremony.

Alexander I.

Edgar, dying childless, was succeeded by his brother Alexander I. (1107-24). Educated by his mother, and after her death in England, Alexander, like his brothers, brought to the government of Scotland Saxon combined with Norman culture. The singular will by which Edgar left Cumbria to his younger brother David was not to Alexander's taste; but the support which the Saxon population and the Norman barons, now beginning to hold land in that district, gave to David forced his brother to acquiesce in the division of the kingdom. It was now restricted to Lothian, Merse, and the country beyond the firths, as far as Mar and Buchan. His hold of Moray and Ross, Sutherland and Caithness, must have been rather as suzerain than as sovereign; the mainland of Argyll was now or soon after in the possession of Somerled, ancestor of the lords of the Isles; the northern isles (Nordreyar) as well as the Sudreyar remained Norse. The chief towns of Alexander were Edinburgh, Stirling, Inverkeithing, Perth, and Aberdeen. At Scone he founded a monastery for canons of St Augustine; but St Andrews was still the sole Scottish bishopric. Alexander married Sibylla, a natural daughter of Henry I. of England, and secured peace with that country. His only recorded war was with the men of Mearns and Moray, who surprised him at Invergowrie. He pursued them to the Moray Firth, where a signal victory (1114) gained for him the epithet of "The Fierce." The change from the Celtic to the Roman form of church government commenced by his mother and his brother Edgar was continued. Anselm congratulated him on his accession, and asked protection for monks sent to Scotland at Edgar's request. On the death of Fothad, the last Celtic bishop of St Andrews, Alexander procured the election of Turgot, his mother's confessor and prior of Durham. His consecration was delayed through a dispute between Canterbury and York, and, having failed to effect the anticipated reforms, he went back to Durham. On his death Eadmer, a monk of Canterbury and chronicler of note, was selected for the office by Ralph, archbishop of Canterbury. The choice was confirmed by the clergy and people; but a quarrel with Alexander as to his investiture led to his return to Canterbury. Robert, prior of Scone, became bishop in the year of Alexander's death, but his consecration also had to be put off. These disputes as to the consecration and investiture of the bishop of St Andrews turned on the rival claims of Canterbury and York to be the metropolitan of Scotland, and the refusal of Alexander to cede the independence of the Scottish Church, though anxious for an English monk to organize the diocese. National feeling was already strong in Scotland, even in a king with English sympathies.

Without the aid of Turgot or Eadmer, Alexander himself laid the foundation of diocesan episcopacy. The first bishops of Dunkeld and Moray date from his reign, and the first parish on record, Ednam in Roxburghshire. At Inchcolm, as well as Scone, he introduced the canons regular of Augustine, and on an island of Loch Tay a cell from Scone was built in memory of his wife Sibylla. He restored the "Boar's Chase" to St Andrews and increased the endowments of Dunfermline. The offices of chancellor, constable, and sheriff also now appear; and the mormaers of the Celtic districts are designed as earls (*comites*) in one of his charters. The transition from the Celtic to the feudal monarchy had begun. Alexander was a learned monarch, like his father-in-law Henry Beauclerk, pious and friendly to the church, but severe to his subjects.

David I. (1124-53), the youngest son of Malcolm and David I. Margaret, became king at the ripe age of forty-four. He had been trained at the court of Henry I. and his sister Matilda, so that "his manners were polished from the rust of Scottish barbarity." After Edgar's death he served an apprenticeship for the royal office as earl or prince of Cumbria, where his power was little short of regal. He married a Saxon, the daughter of Waltheof, earl of Northumberland, widow of Simon de St Liz, Norman earl of Northampton, and his friends and followers were chiefly Norman. His marriage brought him the earldom of Huntingdon, and he was guardian of the earldom of Northampton during his stepson's minority, so that he entered into feudal relations with the Norman king of England. In the government of his principality he succeeded in reducing a wild part of Scotland into order, using for this purpose the agency of the church.

The history of the church in Strathclyde since Kentigern's death is obscure. The records of York claim the consecration of a bishop of Glasgow in the middle of the 11th and another at the commencement of the 12th century; but they are unknown in the records of Glasgow, and were perhaps invented to support the metropolitan claim of York over that see. Glasgow certainly was restored after some considerable lapse in the person of John, the tutor of David, who at his request was consecrated by Pope Paschal II. This was a parallel step to the summons of Turgot and Eadmer to St Andrews, but David, like Alexander, maintained the independence of his own bishopric, and, though pope after pope sent letters and legates exhorting obedience to York, neither John nor his successors yielded it. A new see erected at Carlisle by Henry I. and the restoration of Whithorn by Henry II., both subject to York, were counter measures on the part of the English sovereigns. The independence of the Scottish from the English Church (with the exception of Galloway and some places of Lothian still under Durham) thus asserted by the rulers of Scotland was of great moment in its subsequent history, and was promoted by the liberality of David and his brothers. The inquest by David's order by which the land of the see of Glasgow was made may refer to ancient possession, but it had the effect of a new grant. Its extent—covering lands in the dales of the Clyde, Tweed, Teviot, Annan, Nith, and in Ayrshire—corresponds to the district of Cumbria under David and, with slight deviations, to the future diocese of Glasgow. While David's province did not include all of ancient Cumbria, it did include some parts of ancient Lothian, the future shires of Berwick, Roxburgh, and Selkirk. The Cumbrian nobles were a mixed class,—some Saxon and others Norman. There were few of pure Celtic blood.

Three years after his accession David was present at the council of London, where, along with the English barons, he swore to accept his niece Matilda as the successor of

Ecclesiastical affairs.

David and Matilda.

Henry I., who had lost his only son by the shipwreck of the "White Ship." Soon after a rising of Scottish Celts under a natural son of Alexander and Angus, a grandson of the mormaer of Moray, was defeated at Stracathro (Forfar) by David's troops in his absence in England, and four years later another under Wimund, who pretended to be Malcolm MacHeth, a chief in Ross, aided by Somerled of Argyll, who had acquired some of the adjacent isles, was put down by Wimund's capture. The death of Henry I. and the claim of Stephen to the English throne led to the invasion of England by David, in support of Matilda, with an army drawn from all parts of his kingdom,—the men of Galloway, Cumbria, Teviotdale, Lothian, Lennox, the Isles, Scotia (the country south of the Forth or Scots Water), and Moray. Their defeat at the battle of the Standard at Cuton Moor (1138) near Northallerton by the barons of northern England was due to the want of discipline of the men of Galloway, and, though signal, was not decisive. At Carlisle peace was made on condition that David's son Henry should hold Northumberland as an earldom under Stephen, with the exception of the castles of Bamborough and Newcastle. David gave hostages, but retained Carlisle and Cumberland without any condition of homage. Two years later, when Matilda seized London, David joined her; but she was unable to maintain her advantage. David was forced to return to Scotland, and did not again engage in active hostilities against Stephen. His death was preceded by that of his only son; but his power was so firm that he procured the acknowledgment of his grandson Malcolm, a boy of twelve, as successor to the Scottish crown, while William, his younger grandson, succeeded to Northumberland and the English fiefs his father had held.

Diocesan and feudal organization of kingdom. The comparative peace of his last twelve years gave David opportunity for the ecclesiastical and civil organization of the kingdom. He found three and left nine bishoprics, adding to St Andrews, Moray, and Dunkeld the new sees of Glasgow, Brechin, Dunblane, Aberdeen (transferred from Mortlach), Ross, and Caithness. Closely connected with their establishment was the suppression of the Celtic Culdees at Dunkeld, St Andrews, and Loch Leven, and perhaps also at Dunblane and Dornoch, where canons regular of St Augustine became the chapters of the bishop. The abbeys, chiefly Cistercian, which he founded were Holyrood, Newbattle, Melrose, Jedburgh, Kelso, Cambuskenneth, Urquhart, and Kinloss. He added to the endowments of his father and mother at Dunfermline, and so lessened the crown lands that James I. called him "a sore saint for the crown." The division into dioceses stimulated the formation of parishes endowed by the bishops or by the lords of the manor; but the first steps of the parochial division of Scotland are obscure. The diocesan episcopate now included the whole of Scotland except what was held by the Norsemen, who had bishoprics of their own for the Orkneys and the western isles, subject to the metropolitan of Drontheim. It preceded the civil division into sheriffdoms, which also began in this reign, but took a longer period to complete. The Celtic chiefs in the north and in Galloway were as yet too powerful to allow royal officers to hold courts within their territory, and regalities with the full rights of the crown in matters of justice were more lavishly granted in Scotland than in England, where they were confined to the few palatine earls or bishops on the border. The feudal system in Scotland, erroneously antedated to the reign of Malcolm II. or Malcolm Canmore, really took root in that of David. The king administered justice in person. The great judicial officer of state, the justiciar, who went circuits in the king's name, appears either in this or the preceding reign; so also do the seneschal or steward of the royal household

and the chamberlain who collected the royal revenues. 1127-1165. The tenure of land by charter, of which there are a few examples by Edgar in favour of Durham and by Alexander I. in favour of Scone, now became common. The charters of David to the abbey of Holyrood, to Robert Bruce of Annandale, and others are in the regular style of the Norman chancery. There are also instances of subordinate grants by subjects, which the king confirms. Though no charter to a burgh is extant, David refers to Edinburgh, Perth, and Stirling as his burghs. The inquest in favour of the see of Glasgow is, by the verdict of those best acquainted with the facts, similar to the Norman inquest. The laws of the four burghs of Lothian—Berwick, Roxburgh, Edinburgh, and Stirling—are records of customs existing in this reign, while a variety of other laws called assizes, chiefly relating to tolls and matters of criminal jurisprudence, were the legislative acts of the king, assisted by the council of his great nobles. The beginning of the feudal system in Scotland was invigorated by the personal character of David. The absence of any large body of settled Celtic or Saxon customs gave full play to its assimilative influence. In the reigns which followed Scotland became a purer example of a feudal state than England, where a large number of Teutonic customs contributed to form the common law. A few of these found their way into Scotland, chiefly through the burghs or the medium of Norman charters, in which they had been incorporated. But the Scottish common law was in the main derived from the Roman code through the canon law, and not from Anglo-Saxon customs. Though never canonized by the church, this great monarch, for his faithful administration of justice and the purity of his domestic life, was deemed a saint by the people.

David's grandson and successor Malcolm IV. (1154-65), Malcolm called "The Maiden," died too young to leave a permanent impression. A rising by Somerled, lord of the Isles, and the sons of Malcolm MacHeth, mormaer of Moray, was suppressed in the early years of his reign, and peace was made with Somerled in 1158. A treaty by which Malcolm surrendered Northumberland and Cumberland to Henry II., and his following that king (who knighted him at Tours) in an expedition to Toulouse, led to the revolt of the earl of Strathearn with five other chiefs. This brought him suddenly home. An attempt to take him by surprise at Perth failed, and next year he succeeded in reducing Moray and Galloway, whose earl, Fergus, had also taken advantage of his absence. Moray was occupied by foreign settlers (1160), amongst whom, besides Norman barons, were Flemings,—a race fitted to civilize a new country by their industry. It is to this settlement that the permanent subjection of Moray to the Scottish kings, and perhaps the peculiar dialect and character of the inhabitants of that part of Scotland, were due. Four years later Somerled again attacked the west coast, but was defeated and slain at Renfrew, when the isles south of Ardnamurchan, which he had won from Godred the Black, son of Olaf, king of Man, were divided amongst his sons Dugall, Reginald, and Angus. Next year (1165) the young king himself died at Jedburgh. While he was reproached for yielding too much to the powerful English monarch, his service abroad enabled him to obtain the necessary experience to contend with the Celtic chiefs. The reduction of Galloway and Moray more than compensated for the loss of the earldoms in northern England, the possession of which by the Scottish king must have been precarious. Before his death Bute had been taken by the steward of Scotland,—the first footing the Scotch got on the larger isles, but it was afterwards recovered by the Norwegian king Haco and restored to Ruari, a descendant of Reginald.

Malcolm, dying childless—though he had an illegitimate

1165-1215. son who predeceased him—was succeeded by his brother William the Lion (1165-1214). His reign, the longest of any Scottish monarch, though not so uniformly successful as that of his grandfather, was an important era in Scottish history. It is divided into nearly equal portions by the accession of Richard Cœur de Lion. The first consists of the war with Henry II., in which William was captured (1175), and this made him the subject of the English king for fourteen years. In the second he recovered his independence, and, resuming the task of his predecessor, consolidated the Scottish kingdom in the north and west. William commenced his reign by taking part in the war with France as vassal of Henry II. for the fief of Huntingdon; but, being disappointed of the promised restoration of the northern earldoms, he entered into negotiations with Louis VII. of France. This memorable event is the first authentic connexion between Scotland and France, and was afterwards antedated by a fiction to the time of Charlemagne. Dictated by the situation of the two countries, equally exposed to danger from the power of England under the Angevin or Plantagenet kings, the alliance between France and Scotland continued with few breaks until the close of the 16th century, and even in the 17th and 18th was relied upon by the last of the Stuarts. France proved a broken reed to the Scottish kings; but the intercourse between the two countries brought the Scottish people, when war with England after the close of the 14th century shut them out from the advancing civilization of that country, into contact with the chivalrous manners of the court and the learning of the schools of France during the best period of French history. Nothing came of the alliance at this time, and two years later William and his brother David, in whose favour he resigned the earldom of Huntingdon, attended the coronation (during his father's life) of the younger Henry at Windsor. That ill-judged step and the murder of Becket led to a domestic revolution, and William, tempted by the promise of the earldom of Northumberland, joined the young king against his father (1173). He failed in the sieges of Wark and Carlisle, and next year was taken prisoner at Alnwick by Ranulph de Glanville and sent by Henry's order to Falaise in Normandy. To procure his release he made a treaty with Henry by which he became his vassal for Scotland and all his other territories. The Scottish Church then for the first and last time owned subjection to that of England. This treaty settles the disputed question of the Scottish homage. It was only by conquest and the captivity of its king that such terms could be obtained. To secure the observance of the treaty the four burghs of Scotland were to be placed in Henry's hands and hostages given till their delivery. The ambiguous terms of the clause as to the church enabled the Scottish bishops to refuse obedience to the see of York, and, Canterbury having advanced a rival claim, Henry, not displeased to see ecclesiastics quarrel, allowed the Scottish bishops to leave the council of Norham without acknowledging it. The foundation of the abbey of Arbroath in memory of Becket, whom he had known at Henry's court, was almost the only endowment of William. At home he put down revolts in Galloway, Ross, and Caithness. A long dispute with successive popes as to the see of St Andrews afforded a signal example of the perseverance of William. He also procured a distinct acknowledgment of the independence of the Scottish Church and its immediate subjection to Rome alone, which Henry II., now approaching the calamitous end of his reign, could not prevent; nor was he able to enforce payment of the Saladin tax from the Scottish bishops. Immediately after Henry's death Richard Cœur de Lion, moved by the necessity of money for the crusades, consented for a payment of 10,000 marks to the abrogation of the treaty of Falaise (1189) as having been extorted

from William when a captive, and restored Scotland's ancient marches.

The second part of William's reign was occupied with internal affairs. Richard's absence and John's disputes with the pope and his own barons gave a relief from English war. The raising of the ransom tried the resources of Scotland, and was met by an aid from the clergy and barons. Risings by Harold, earl of Caithness, and his son Torphin (1197), and another by Guthred (1211), a descendant of the mormaer of Ross, were quelled. The birth of a son strengthened William's throne. He at one time contemplated an invasion of England, for which John's weakness afforded a good opportunity, but desisted, it is said, in consequence of a vision, perhaps remembering his own age and that of his heir. The proposed erection by John of a castle at Tweedmouth to overawe Berwick led to a rupture; but, after protracted negotiations and threats, a treaty was made (1209) by which William agreed to pay 15,000 marks. John was to procure suitable matches for his two daughters, and Tweedmouth was not to be rebuilt. The barons promised at a council in the following year to raise 10,000 and the burghs 6000 marks. This is the first mention of a contribution by the burghs to a feudal aid. William was their great benefactor, as Henry the Fowler in Germany and Richard in England: many of their charters date from his reign. Legislation continued in the form of assizes, which required the sanction of a great council. As in England, the necessity of raising money first gave rise to municipal rights and to facilities for some discussion of public affairs in what afterwards grew to be the parliament. This assembly was still the *curia regis* of the vassals of the king, and the Scottish parliament never lost marks of its origin. William died at Stirling in 1214 in the seventy-second year of his age. The lion rampant, which he took for his seal, became his epithet, and represents his chivalrous and determined character. He set the example, which his son and grandson followed, of cultivating friendly relations with the English sovereign, and his efforts to maintain the independence of Scotland were rewarded by internal peace. It was only in the outlying districts that risings had now to be feared. The number of shires where the king's sheriff, frequently (by a policy wise at the time, but afterwards dangerous) the chief baron of the district, administered justice at the head towns increases, and this, as well as the growth of trade, brought into prominence the burghs, each with a royal castle where the king in his frequent progresses held his court, and if needful summoned the great council of his realm. The chief burghs whose charters date from this reign are Perth, Aberdeen, Inverness, Dumfries, Lanark, Irvine, Ayr, Forfar, Dundee, Arbroath, Montrose, Inverurie, Kintore, Banff, Cullen, and Nairn. Their number and sites, spread over the whole country, mark a settled policy and the progress of the kingdom in the arts of peace. A new diocese—Argyll—was founded by separation from Dunkeld, to which John the Scot, then bishop, sent his chaplain as knowing Gaelic; and, though the Hebrides were still Norse, this was a step towards the complete organization of the church and to the extension of the kingdom which followed in the next two reigns, when the Isles also were added (1266) to Scotland.

Alexander II. (1214-49), son of William, was crowned Alexander II. at Scone in his seventeenth year, in time to take part in the great struggle in England for Magna Charta, which had reached its crisis. He sided with the English barons, who made an agreement by which Carlisle and the county of Northumberland were to be given to Alexander. In fulfilment of his part he besieged Norham, while the barons inserted in Magna Charta a clause by which John

promised to render to Alexander what was his right with reference to the marriage of his sisters and his kingdom, unless the charters of his father William authorized otherwise, and this was to be decided by the judgment of his peers in the *curia regis*. The position of the Scottish king as one of the English barons in whose favour Magna Charta was granted is pregnant evidence of the fact that he was not, like John, Henry III., and Edward I., a monarch with imperial tendencies, the adversary of the rights of the barons and the people. The Scottish kings in this century and Bruce in the next were popular sovereigns, and their memory supported the crown when it was worn by less worthy successors. Next year John broke the charter, reduced by the aid of mercenaries the northern counties of England, and, advancing into Scotland, stormed Berwick and burnt Roxburgh, Haddington, and Dunbar. On his return he pillaged Coldingham and set fire to Berwick. Alexander retaliated by wasting England as far as Carlisle, which town, but not the castle, he took in the autumn; then, marching to Dover, he did homage to Louis, the son of Philip Augustus, whom the English barons had chosen as king. Next year (1217) he again invaded England, but made peace with Henry III., which was confirmed three years later at York. Alexander agreed to restore Carlisle, do homage for his English fiefs, and obtain release from the excommunication which the pope had declared against the barons and their allies. Henry promised to give Alexander one of his sisters in marriage and to procure suitable husbands for the Scottish princesses. Accordingly, Alexander married Joan, the elder daughter of John, while Margaret, his sister, became the wife of Hubert de Burgh, earl of Kent, and Isabella of Roger Bigod, earl of Norfolk, both nobles who took a prominent part in the Barons War. These alliances rendered the peace with England more secure, and allowed Alexander to devote himself to the reduction of the periodical insurrections of the Celtic and Norse chiefs on his northern and western borders. He reduced Argyll (1222), which he created a sheriffdom, and forced John, earl of Caithness, to surrender part of his lands and pay compensation for his share in the burning of Adam, its bishop. The wisdom of his settlement of Argyll was proved by the inhabitants repelling an attack by Haco, the Norse king. He was equally successful in quelling the risings of two chiefs of the same name, Gillescop, one in the west, the other in Moray. Five years later (1230) a disputed succession in Galloway gave him the opportunity of chastising that turbulent province and dividing it among three co-heiresses. The fall of Hubert de Burgh and the succession of Peter des Roches to the chief place in the council of Henry III. changed the attitude of that king towards Scotland, but Otho, the papal legate, preserved peace by a compromise of the rival claims. A little more than a year after the death of his wife Joan without issue, Alexander married Mary de Couci, daughter of a French noble house, which counted itself the equal of kings, and Alexander III., the child of the marriage, was betrothed when an infant of a year old to Margaret, daughter of Henry III. Two years later (1244) a serious rupture, fomented by Walter Bisset, a Scottish exile, and caused by a projected alliance of Alexander with France and the erection of castles on the border, was averted by the treaty of Newcastle, by which the kings of England and Scotland bound themselves not to make alliances with the enemies of each other. The last year of his life was occupied in putting down a second rising in Galloway, and in preparing for an expedition against Haco, with the view of annexing the Hebrides; but he died of fever at Kerrera, in the Bay of Oban, while mustering his fleet. These expeditions, all successful, are proof of the active

character of the king, who must have been called "Peace-ful" because he preserved peace with England, for he was in fact a warlike monarch, enforcing the feudal levy, which, according to Matthew Paris, amounted in his time to 10,000 horse and 100,000 foot, and extending the feudal civil government. Like his predecessors, he was a benefactor of the church, especially of the new mendicant orders, whose monasteries were founded in all the principal towns. The most important of his statutes were the substitution of trial by jury for the ordeals of fire and water, and the regulation of trial by battle, with provision for the case of women and the clergy. He was deemed, like David, a protector of the poor.

Alexander III. (1249-85) was only eight years old when Alexander his father died. A succession of contests for the regency between a party of nobles who favoured English influence and a national party was the consequence. The former tried to delay the coronation on the pretence that the young prince was not a knight; but Comyn, earl of Menteith, baffled them by the proposal that the bishop of St Andrews should perform both ceremonies. The rehearsal of his descent from the Celtic line of kings was made, according to a custom becoming old-fashioned, for the last time by a Highland sennachy, to please the Gaelic subjects, while the translation of the corpse of St Margaret into a precious shrine at Dunfermline was calculated to have a similar effect in the Lowlands. Henry III. had asked the pope to declare the coronation illegal without his consent, but the pope refused. Foiled in this, Henry celebrated at York the nuptials of his daughter and the young king, whom he asked to render homage for his kingdom. The reply that he had not come to answer such a question and must advise with his counsellors implied that he had counsellors little likely to grant it. About this time Durward the justiciar and Robert the chancellor were dismissed, and the earl of Menteith held the chief power for five years. A secret mission of Simon de Montfort led to the earl of March, Durward, and other nobles seizing the young king and queen, and at a meeting with Henry at Kelso the Comyns and their supporters were removed from office (1255) and other regents appointed. Two years later the bishop of St Andrews got the pope to excommunicate Durward and the English regents. Next year a compromise was effected and a joint regency appointed, consisting of the queen dowager and her husband, the earl of Menteith and Durward, and the supporters of both parties. When Alexander was nearly of age the earl of Menteith died, whereupon the king took the government into his own hands (1261). Henry, engaged in the dispute with his barons, could not interfere. Alexander at once resumed his father's project for the reduction of the Hebrides; but Haco, the Norwegian king, forestalled him by invading Scotland, when a storm, which dispersed his fleet, and the loss of the battle of Largs (1263) forced him to retire to the Orkneys, where he died. Magnus Olafson, king of Man, the chief Norse feudatory, a descendant of Godred the Black, submitted to Alexander, and although some of the islands held out they were reduced by the earls of Buchan and Mar and Alan Durward. At last Magnus, the son of Haco, concluded a treaty at Perth (1266), by which he surrendered Man and the Sudreyar for a payment of 4000 marks and an annual rent of 100; the rights of the bishop of Drontheim were reserved. From this time the western isles were subject to Scotland. At the parliament of 1284, which settled the crown on the Maid of Norway, their great nobles, descendants of Somerled, attended as vassals, and the subsequent revolts (of which there were many) were instigated by the English king, who found useful allies in the chiefs of the Isles. In the Barons War Alexander aided his father-in-law, on

Reduction
of the
western
isles.

1266-1292. whose side three Scottish barons, John Comyn, Robert Bruce, and John Baliol, fought at Lewes, where the first two were taken prisoners. In the matter of the independence of his kingdom Alexander was as firm as his predecessors, and would not allow Henry himself or the legate Ottobon to collect within it a tithe for the crusade which the pope had guaranteed to the English king. On the accession of Edward I. (1272) Alexander attended his coronation, but neither then nor six years later, when specially summoned to Westminster, would he do homage for Scotland. The closing years of Alexander were saddened by domestic losses. His wife died in 1273, his younger son David in 1281. His only daughter, Margaret, married two years before to Erik of Norway, and his elder son, Alexander, both died in 1283. The following year the estates at Scone recognized the succession of Margaret, the Maid of Norway; but Alexander, in hope of a male heir, married Joleta, daughter of Count de Dreux. At the festivities in Jedburgh in honour of the marriage a ghostly figure in the masque was deemed an omen of the king's death, which followed from a fall near Kinghorn (1285). The prosperity of Scotland in his reign was celebrated in one of the earliest verses preserved in the Scottish dialect—

"Quhen Alysander oure kyng was dede,
That Scotland led in luv and le,
Away wes sons of ale and brede,
Of wyne and wax, of gamyn and gle,
Oure gold was changed into lede.
Cryst, born into virginite,
Succour Scotland and remede
That staid in his perplexitie."

Feudal Scotland. Under the wise rule of three kings, extending over more than a century—a circumstance rare in that age—Scotland attained a degree of wellbeing before unknown, which did not return till the 18th century. The extent of the revenue is attested by the returns of the sheriffs to the chamberlain and by the accounts of the tax which Boiamund de Vicci, the pope's representative, levied from the clergy for the crusade. Berwick, the chief Scottish port, was likened to Alexandria, and attained an importance it never recovered after its union with England. Its customs were reckoned as equal to a third of those of all England,—a statement hardly credible till we remember that the trade of Britain was chiefly with France and Flanders, and that a harbour for small craft was sufficient. The personal character and bravery of these kings subdued the turbulence of the outlying districts and kept in check the ambition of the nobles. The bounds of the kingdom were almost as they now are, and the name of Scotland permanently passed to the whole country south as well as north of the Forth. In spite of differences of race, the unity of the nation had been secured, and its independence was acknowledged by the pope and other sovereigns; the English alone kept up a nominal claim to rights which had for short periods been held by Canute and the Conqueror, and for longer by the second Henry, until they were abandoned by the treaty of Canterbury. But now all was to be changed. Three centuries of war, though diminishing in intensity as time went on, display heroic character, but imply an amount of suffering to the people which cannot be told. Perhaps a contest between the two proud nations which shared Britain was inevitable, yet the reigns of the Alexanders suggest a different possibility. That the contest came when it did was due to the disputed succession on the death of Margaret, the Maid of Norway. This gave to the ambition of Edward I. an opportunity to reduce the whole island to his sway, which he was quick to seize.

Maid of Norway. 5. *War of Independence; from Death of Alexander III. to Accession of House of Stuart.*—The Maid of Norway, whose right was at once acknowledged (for Scotland, like England, knew no Salic law), was not to wear the crown.

A regency administered the kingdom for five years after Alexander's death. A conference at Salisbury between commissioners of Erik of Norway, Edward I., three of the regents, and Bruce, lord of Annandale, agreed that Margaret should be sent home unbetrothed. Her marriage to Edward's son, for which a dispensation had been got from the Pope at Rome, was sanctioned by an assembly at Brigham near Roxburgh (18th July 1290), in a treaty which made anxious provision for the independence of Scotland. This country was to remain free, and, saving the right of the king of England in the marches or elsewhere, separate from England by its lawful bounds. No parliament was to sit, and no Scottish suit to be tried, out of Scotland. Edward confirmed this treaty by oath; but the death of Margaret in the Orkneys rendered it abortive. To prevent an armed contest for the crown, Fraser, bishop of St Andrews, invited Edward to intervene, and certain Scottish nobles made a similar request. He accordingly summoned the Scottish estates to meet him on 10th May, and the English parliament on 3d June 1291, at Norham near Berwick. When the Scots came Edward refused to judge the cause of the Scottish succession unless his title as superior of Scotland was admitted. After some delay the barons and clergy gave the admission, as also did the claimants—no fewer than thirteen—but the representatives of the commons withheld any such acknowledgment. The court for the decision of the cause was then appointed. Forty members were named by Baliol and as many by Bruce, between whom the competition really lay, while Edward chose twenty-four. On the following day the competitors agreed that sasine of the kingdom should be given to Edward; a week later the regent surrendered the kingdom of Scotland and the keepers the chief castles into his hands as lord paramount. He restored possession after adding several Englishmen to the regency. After another adjournment the competitors put in their claims. Three descendants of David, earl of Huntingdon, brother of William the Lion—all English barons, though one, Bruce, had large estates in Scotland—were alone serious. John Baliol claimed as grandson of David's eldest daughter Margaret, wife of Alan, lord of Galloway; Robert Bruce as son of David's second daughter, wife of the lord of Annandale; while David de Hastings, grandson of the third daughter Ada, contended that the kingdom was partible. This last question was postponed until the claims of Baliol and Bruce had been considered. After two long adjournments it was at last decided (14th October 1292) that the case was to be ruled by the law of the kingdom applicable to titles of earldoms, baronies, and other indivisible inheritances, and "that by this law in every heritable succession the more remote by one degree descended from the eldest sister was preferable to the nearer in degree from the second." Edward accordingly decided (17th November 1292) in favour of Baliol. Two days afterwards the regents were ordered to give sasine to Baliol; the day following he swore fealty to Edward at Norham; ten days after he was crowned at Scone; within a month he did homage to Edward at Newcastle.

The judgment was just, according to the principles of feudal law afterwards fixed, though then imperfectly established, in favour of primogeniture; the acknowledgment of the suzerainty of Edward was a different matter. In the course of the proceedings Edward obtained from the cathedrals and religious houses of England returns of homage by Scottish kings. No such returns were asked from Scotland. Those from England recited the well-known cases of isolated conquest followed by homage to Saxon, Danish, and Norman kings, Edward the Elder and Athelstan, Canute and the two Williams, and the treaty of Falaise by which William the Lion surrendered the

Treaty of Brigham.

Competition between Bruce and Baliol.

made king.

independence of Scotland. They ignored the treaty of Canterbury by which it was restored, the clause of Magna Charta relating to Scotland and the rights of its king, the refusal of the last two Alexanders to render homage for their kingdom, and the treaty of Brigham by which Edward had acknowledged the independence of Scotland. One result of the submission to the English king overlooked by the eager competitors, but not by the lawyers who advised Edward, immediately emerged. An appeal was soon taken from the court of Baliol to the court of his superior at Westminster. Baliol referred in vain to the express clause in the treaty of Brigham that no Scottish suit was to be tried beyond Scotland; Edward replied this was an appeal from his own officers during the interregnum, but asserted his right to hear appeals in all cases. Other appeals followed, and Baliol weakly surrendered his claim to independent jurisdiction. Shortly afterwards (October 1293) he was himself summoned to Westminster as defendant in a suit by Macduff, son of the earl of Fife. Declining to appear, he was condemned for contempt, and three of his principal castles were ordered to be seized. He again yielded and promised to attend next parliament. There could be no longer doubt what had been the effect of submitting the dispute as to the crown to Edward. Instances of homage had not been difficult to find; but the records might be ransacked in vain for an example of what would now become frequent,—the adjudication by the court of the English king on the rights of Scotsmen. The execution of this decision by force in Scotland carried with it at no distant date the subjection of the kingdom. Baliol quitted Westminster suddenly in 1294 to escape service in the Gascony war. By yielding in the question of appeal he had lost the confidence of the Scottish barons. In the parliament of Scone a council was appointed to control him, and all fiefs held by Englishmen were forfeited. In the following year he formed an alliance against England with the French king, and his son was promised the daughter of that king's nephew, the count of Anjou, in marriage. The Scottish army headed by six earls then invaded England, but was repulsed at Carlisle (28th March 1296), and Edward, leaving his French campaign, at once marched northwards. Before the end of March 1296 he stormed Berwick. While there the abbot of Arbroath brought him a renunciation of Baliol's homage. Dunbar was taken soon afterwards by the earl of Surrey; Roxburgh, Jedburgh, and Edinburgh fell before the end of June; Stirling, Perth, and Scone surrendered without a blow. At this time no Scottish town was walled and no resistance could be made against the English feudal levy led by such a general as Edward. In the churchyard of Stracathro in Forfar Baliol renounced his alliance with France, and a few days afterwards (10th July) surrendered Scotland to Anthony Beck, bishop of Durham. Edward marched as far as Elgin, but it was a conquest of Baliol, not of Scotland. This impotent monarch was carried captive with his son to London and vanishes from Scottish history. He died at one of his French fiefs twenty years afterwards, never having attempted to regain the kingdom. On his homeward march Edward took and recorded in the Ragman Rolls the homage of the Scottish nobility, and carried to Westminster the sacred stone of Scone, on which the Celtic monarchs had been crowned, and the black rod of Margaret, the hallowed relic of the Saxon line. Surrey was appointed guardian, Sir Hugh Cressingham treasurer, and William Ormsby justiciar of Scotland; the nobles were treated with lenity and the bishops bribed by the privilege of bequeathing their movables like their English brethren. The most important result of the campaign was the capture and fortification of Berwick. That city, the key to the Lothians, was the commercial capital;

and Scotland was left without one until the rise, after the 1292-1298. union, of Glasgow and the mercantile centres of the Clyde.

When the fortunes of Scotland were at the lowest, when the country was deserted by the king, and its nobles and clergy were making terms with the conqueror, Wallace, the man of the people, appeared. The second son of Sir Malcolm Wallace of Elderslie near Paisley, his name indicates a remote Celtic origin from a Welsh or Cambrian stock. In the spring of 1297, in revenge for the murder of his wife, Wallace slew Hazelrig, sheriff of Ayr, and burned Lanark. Collecting a band of followers animated with like patriotism, and aided by a single noble, Sir William Douglas, he surprised and drove Ormsby, the justiciar, from Scone and Beck, the bishop of Durham, from Glasgow. Some of the barons, headed by James the Steward, joined him, and Wallace and Douglas carried everything before them in Lennox and Galloway,—districts more favourable to the national cause than Lothian. The nobles fell away from Wallace almost as soon as Percy appeared at the head of an English force, and Douglas, the Steward, Bruce the future king, and others capitulated at Irvine (9th July 1297). Wallace, while engaged in the siege of the castle of Dundee, heard that Surrey and Cressingham were advancing on Stirling, and he marched to its relief. There at the bridge over the Forth near Cambuskenneth he won his most famous victory (11th September). The English were totally routed and Cressingham was killed. The disparity of numbers was great, for the English had 50,000 foot and 1000 horse, against at most 40,000 foot and only 180 horse. The generalship of Wallace, who tempted his adversary to cross the bridge in his face and held his troops in hand until the moment of the charge, won the day, the first in which a feudal army was beaten by light-armed peasants. Wallace attempted to organize the kingdom he had won. He assumed the title of guardian of the realm in name of the Lord John (Baliol), and associated with himself Sir Andrew Moray of Bothwell, son of the only baron who stood by him and who fell in the battle. He held the nobles in awe, while he rewarded his adherents. The grant (fortunately preserved) of the office of constable of Dundee to Alexander Scrymgeour can scarcely have been a solitary one. He introduced better discipline in the army, and tried also to revive trade.¹ Shortly after the battle of Stirling Wallace carried the war as far as Hexham, whose monks he protected. That he penetrated farther south and won the favour of Eleanor, Edward's wife, is one of the romantic additions to his scanty history in the poem of Blind Harry. Edward recognized the crisis and, leaving Flanders, sent a force before him under Pembroke, following in person at the head of 80,000 foot and 10,000 horse. For a brief space success attended Wallace, who defeated the English in Fife and Ayr; but the bishop of Durham retook the castle of Dirlتون, and Edward himself, by the victory of Falkirk (22d July 1298), in which the nobles again proved false to the popular cause, reversed that of Stirling. Wallace took refuge in France, and, although the French king at Amiens offered to surrender him, he was soon released and provided with a safe conduct to the pope. Papers found on him when captured show that he received similar letters from Haco of Norway and Baliol. Whether he went to Rome is not certain, but he may have been one of the Scots who at this time induced Boniface VIII. to claim the superiority of Scotland. The claim was indignantly repelled by the English barons at the parliament of Lincoln; Edward, however, thought it prudent to lay before the pope a statement in which he advanced not only

Wallace's struggle for independence.

¹ A letter from him and Moray to the citizens of Lübeck and Hamburg who sympathized with the Scottish commons has been found in the archives of Hamburg.

1298-1328. the instances of homage collected for use at Norham but the fable of Brute the Trojan, from whose eldest son Locrinus he claimed descent, and therefore superiority over the Scottish kings sprung from Albanactus the second as well as those of Wales descended from Camber the third. Baldred de Bisset, the Scottish commissioner at Rome, in his answer admitted the pope's right, but replied to Edward's fiction by another as bold,—the descent of the Scots from Scota, the daughter of Pharaoh. A more solid argument was founded on the treaty of Brigham. The pope delayed judgment, and in 1302 suddenly changed sides and exhorted the Scots, by several bulls, to submit. Edward had not waited for this sanction; the period between the battle of Falkirk and the taking of Stirling was a continuous and bloody struggle. In person he laid waste Galloway and took Caerlaverock (1300); in 1302, his general Sir John Segrave, having fought a battle of doubtful issue with Comyn and Fraser at Roslin, Edward returned (1303), marched as far as Caithness, and reduced the whole east of Scotland by the capture of Stirling (24th January 1304). Scotland was subdued, yet Wallace lived, and we catch glimpses of him, in the woods of Dunfermline, in the forest of Ettrick, in the neighbourhood of Lanark. A price was set on his head, and at last he was betrayed by a servant of Sir John de Menteith near Glasgow and taken to London, where, after a mock trial in Westminster Hall, he received the traitor's doom (23d August 1305), though he denied with truth that he had taken any oath to Edward.

Settlement of Scotland by Edward I.

This time Edward, in order to make the conquest of Scotland permanent, proceeded to incorporate it in the empire of England. With apparent fairness an assembly was summoned to Perth to elect ten representatives to attend a parliament at Westminster to treat of the affairs of Scotland. Nine commissioners came to London, where they were associated with twenty Englishmen. The result was the "*Ordinacio facta per dominum regem pro stabilitate terræ Scotiæ*" (1305). Though never fully carried out, this document, on the model of similar ordinances for Wales and Ireland, discloses Edward's designs. English nobles were appointed to administer the government of the country, and eight justices to administer the law. The law and usages of Scotland (except those of the Bretons and Scots, which were abrogated) were to be observed in the meantime; but the lieutenant (John of Brittany, the king's nephew) and council were to amend what was contrary to God and reason, or in case of difficulty refer to Edward at Westminster. The whole country was divided into sheriffdoms, the sheriffs being removable at the discretion of the lieutenant. The office of coroner, more important then than now, was also regulated; certain persons were nominated constables of the chief castles; and many nobles were fined and others banished. Bruce (the competitor's grandson) was ordered to put Kildrummy Castle (Aberdeen) in charge of an officer for whom he should be responsible. The ordinance was suitable to its object,—moderate, even humane. The banishment of the nobles was limited as to time. Relief was given in the payment of fines. Many old officers were continued. Edward's aim at this time was to pacify the country he had conquered, to put down resistance, but to encourage submission. It is as wrong to call him a tyrant as Wallace a rebel: the one was a statesman king with imperialist aims, the other a patriot leader with keen popular sympathies. The king triumphed; but before his death his well-laid plans were shattered: Scotland again rose in arms, and this time the nobles joined the people, under the leadership of Robert the Bruce.

Robert the Bruce.

The position, as well as the character, of Bruce contrasted with that of Wallace. Instead of being a cadet of the ordinary landed gentry, Bruce represented a family in

which for more than two centuries the purest Norman blood had flowed. The English branch of Skelton in Cleveland and the Scottish branch of Annandale divided their large possessions; but those of the latter sufficed to make its head one of the most powerful nobles in Scotland, who still retained, as so many did, English fiefs. More than one of his ancestors had intermarried with the royal house of Scotland (see ROBERT THE BRUCE, vol. xx. p. 592). On his father's death Bruce succeeded to Annandale. He held besides several manors in England. During the early part of the War of Independence, like many barons with conflicting interests, he had wavered, sometimes supporting Wallace, more frequently the English king. In 1303-4 he assisted Edward in the preparation for the siege of Stirling. He had been consulted with regard to the ordinance of 1305. But there were already signs of mutual distrust. The provision in the ordinance as to Kildrummy shows that Edward was aware special precautions had to be taken to secure the loyalty of Bruce, and on 11th June 1304 Bruce secretly met near Cambuskenneth Lamberton, bishop of St Andrews, and entered into a bond referring to future dangers from Edward. Of all the Scottish clergy Lamberton had been most friendly to Wallace, and this bond was a link between the two periods of the War of Independence and their leaders. Bruce had attended at Westminster when the ordinance was settled, but left suddenly, arriving at Dumfries on the seventh day. There he met in the church of the Friars Minor John (the Red) Comyn of Badenoch, Baliol's nephew, and slew him before the high altar (10th February 1306). The die was cast, and indecision vanished from the character of Bruce. Collecting his adherents at Lochmaben and Glasgow, he passed to Scone, where he was crowned by the bishop of St Andrews. It at first seemed likely that a saying of his wife would prove true,—that he was a summer but would not be a winter king. His defeat at Methven (19th June 1306) was followed by another at Strathfillan (11th August), and Bruce took refuge in the island of Rathlin (off Antrim, Ireland). The tales of his hairbreadth escapes, his courage and endurance in all changes of fortune, were gathered by Barbour from the mouths of the people, who followed the life of their champion with the keenest interest. Meanwhile Edward came north and gave a foretaste of his vengeance. But his severity strengthened the party of Bruce, which grew daily. All classes now made, with few exceptions, common cause against the enemy of all. Edward's death at Burgh-on-Sands (7th June 1307) at once changed the whole aspect of the invasion. Edward II. wasted in the ceremony of a funeral and the diversions of a youthful court the critical moment of the war. Bruce seized his opportunity, and by the close of 1313 Berwick and Stirling alone remained English. The independence of Scotland was finally determined by the ever-memorable victory of Bannockburn (24th June 1314).

Bruce reigned fifteen years after Bannockburn and (if the Irish expedition of his brother Edward be left out of account) with almost uninterrupted success. On his return from Ireland he reduced Berwick (March 1318) and converted it from an English to a Scottish frontier town. His recognition by the pope was followed by the acknowledgment of Flanders and France; and the long truce which Edward II. had been forced to agree to before his death became in the new reign a formal treaty known as that of Northampton (April 1328). By its leading article "Scotland according to its ancient bounds in the days of Alexander III. shall remain to Robert, king of Scots, and his heirs, free and divided from England, without any subjection, servitude, claim, or demand whatsoever." In pursuance of another article Johanna, Edward's sister, was married to David, the infant son of Bruce, at Berwick on

12th July. As an administrator and legislator he showed an ability not inferior to that which in his earlier years he had manifested as a warrior and a general. He obtained from the estates a settlement of the succession, reformed abuses in the feudal law, regulated the courts, providing equal justice for poor and rich, and framed strict Acts against sedition. He also encouraged trade, especially shipbuilding, foreseeing its future importance to Scotland. Never off his guard, amongst his most anxious legislative provisions are those relating to the defence of the kingdom,—arming all able-bodied men, prohibiting exports of arms, fortifying the towns and castles on the borders, arranging signals to give notice of invasion. Though attacked by leprosy contracted in his campaigns, he remained active to the last,—a monarch such as occurs only once in many centuries, brave, liberal, wise, and pious, like the English Alfred, the darling of the nation he had delivered. (For fuller details, see *ROBERT THE BRUCE*, vol. xx. p. 594 sq.)

David II. The wise provision that Bruce made for the regency secured the peaceful succession of his son David II. (1329-70), who was the first Scottish king anointed at his coronation,—a privilege conceded to Bruce in a bull which reached Scotland after his death. According to the ideas of the age this placed the Scottish king on an equality with the sovereigns of Europe. The War of Independence quickened the sentiment of Scottish nationality, and left the country poorer in wealth but richer in spirit. The memories of Wallace and of Bruce educated the people and produced in the next generation their earliest literature. England, unconscious of the benefit, gained by its own defeat. But for the resistance of the Scots it might have become earlier than France a centralized feudal monarchy. The distinct character of the Scots—a blend of the Celt, Saxon, Norseman, and Norman—strengthened by variety the collective force of Britain. The loss which must be balanced against the gain was the bitter hatred between two races of kindred origin within one narrow isle, which for centuries retarded the progress of both, especially of the smaller kingdom.

The almost contemporaneous reigns of David II. and Edward III. reversed the position of the two countries: Scotland had now one of its feeblest and England one of its most powerful kings. Had not the love of liberty become the life-blood of both nobles and commons in Scotland it must have succumbed in the desperate struggle. After the death of Robert, Randolph, earl of Moray, governed with wisdom and vigour for three years. On his death the estates chose Donald, earl of Mar, another nephew of Bruce, whom he had passed over, foreseeing his incapacity. Encouraged by the divisions of the nobles, Edward, son of John Baliol, with the barons who had lost their land by espousing the English side, suddenly landed at Kinghorn. Nine days after his election, Mar was met and worsted by Baliol on Dupplin Muir (11th August 1332), where Mar himself and many nobles were slain. Baliol was crowned at Scone; but Perth was immediately retaken, and Baliol, having been defeated at Annan by the young earl of Moray, left Scotland. Next year Edward came with a large army to his support and defeated at Halidon Hill (20th July 1333), chiefly through the skill of the archers, the Scots led by Archibald Douglas, lord of Galloway, who was now regent. Berwick capitulated and Baliol surrendered it to England, pledging in addition the castles of the Lothians, including Edinburgh and Linlithgow, in security for an annual tribute of £2000. Like his grandfather, Edward III. made a new ordinance for the government of Scotland, but his officers never obtained possession of their posts. Meantime David and his queen fled to France, where they remained seven years. Fortunately for Scotland a new race of patriotic leaders appeared: Moray of Bothwell handed down the

traditions of Wallace and Bruce, while Robert the Steward, 1328-1365, Douglas the knight of Liddesdale, and Sir Alexander Ramsay of Dalhousie sustained the fame of Bruce, Randolph, and Douglas. The attraction of a French campaign with the crown of France as prize prevented Edward from ever using his whole force against Scotland, and a French fleet made a diversion by attacking the Channel Islands and threatening the Isle of Wight. Edward retaliated by assuming the title of king of France, and after two years' preparation invaded that country from Flanders. The armies met at Vironfosse (26th September 1339), where David of Scotland was present. Never was the pomp of chivalry seen in greater splendour, but the first act of the Hundred Years' War, which seemed destined to make French and English eternal enemies and French and Scots perpetual allies, passed without a blow.

Two years later the recovery of the Scottish castles and the repulse of Salisbury's attempt on Dunbar made it safe for David to return to Scotland, which Baliol had abandoned. Though scarcely eighteen, he assumed the government (30th March 1342). Before his arrival Edinburgh had fallen, and next year Roxburgh was taken by Sir Alexander Ramsay, whom David unfortunately rewarded by the sheriffdom of Teviotdale, which the knight of Liddesdale claimed, and Ramsay, seized by treachery, was starved to death at the Hermitage by the knight of Liddesdale, who entered into correspondence with the English king, and dishonoured his name of the "Flower of Chivalry." Bullock, an ecclesiastic who had risen to the office of chamberlain under Baliol and transferred his services to David, met the same fate at the hands of the king on a suspicion of treason. Other signs of weak government were not wanting. On the conclusion of a brief truce, David, tempted by Edward's absence, invaded England in spite of the defection of some of his chief nobles, and was defeated at Neville's Cross (17th October 1346) near Durham by the archbishop of York and the northern barons, the king and several of his nobles being taken prisoners. The rigour of David's captivity (which lasted eleven years) was relaxed so far as to allow him to return frequently to Scotland and try to persuade the people to raise his ransom, which the English king urgently required. Though Baliol was still acknowledged as nominal king by Edward, he resided in Galloway, while Robert the Steward, elected regent in the name of David, really governed. At length by the treaty of Newcastle (13th July 1354) David's ransom was agreed on, sufficient hostages being taken for its payment. Next year the French king resumed the Scottish war by sending Eugène de Garancière with men, money, and arms. Several border engagements followed, but Edward, advancing to the frontier, took Berwick, and obtained from his puppet Baliol an absolute surrender of the Scottish kingdom for an annuity. He ravaged the Lothians in the raid called the Burnt Candlemas, but failed really to reduce the country. Edward's victory over the French at Poitiers, in which many Scots were slain, forced the Scottish parliament to grant the terms dictated by the English king. Peace was finally concluded by the treaty of Berwick (3d October 1357), and confirmed at Scone,—the ransom being raised and the condition as to hostages made more severe. David at once returned to Scotland. But his sympathies had become English; he revisited that country almost every year, and it required all the strength of the Scottish estates to prevent the son of Bruce from making a surrender of his kingdom more ignominious than Baliol's. The enormous ransom pressed hard on so poor a country. An attempt to induce France to resume the war failed, and David, like a debtor dealing with a money-lender, had to renew his bills at usury. Negotiations for this purpose

1365-1390. went on till 1365, when a truce for four years was agreed to. Edward and David latterly devised schemes for payment by another process,—the transfer of the crown at David's death to an English prince. At the parliament of Scone David proposed that Lionel, duke of Clarence, should be recognized as his heir; but the estates replied with one voice that no Englishman should rule Scotland, and renewed the settlement of the succession by Bruce on Robert the Steward. Hatred of foreign aggression and the weakness of the king enabled the Scottish barons to play a part similar to that taken by the nobles of England in the reigns of John and Henry III., and obtain guarantees for the constitution by limiting the monarchy. Such was probably the origin of the committees of parliament (at a later date turned to an opposite use) for legislation and for judicial business which first appear in 1367,—the statutes for the more regular administration of justice, purity of the coinage, and the revocation of the grants of royal revenues and estates. It was expressly declared that no attention was to be paid to the royal mandate when contrary to law. About this period David entered into a secret agreement with Edward, promising in return for a remission of the ransom to settle the crown on him failing heirs of his own body, but the public negotiations for its payment went on. In the same year his marriage with his second wife, Margaret Logie, a daughter of Drummond, a lesser baron, led to a revolt. He quelled it and threw the steward and at least one of his sons into prison, making lavish grants to Margaret and her relatives. Her influence did not last long, as she was supplanted in the king's favour by Agnes of Dunbar. Margaret was divorced by the Scottish bishops, for what cause is not known, and, though her appeal to the pope succeeded, David did not survive the decision. He died on 21st February 1370, childless, and the succession opened to Robert, son of Bruce's daughter Marjory, the first of the Stuarts who were to govern Scotland for the next two centuries.

6. *House of Stuart from Robert II. to James IV.*—The descent of the house of Stuart is traced from Walter Fitz-Alan, a Norman, steward of David I. His estates were in Renfrew, to which Alexander, the fourth steward, added Bute by marriage. Walter, the sixth steward, was scarcely one of the chief nobles; but his prowess in the War of Independence gained him the hand of the daughter of Bruce. Robert II. was their only son. Such was the prosperous record of the family before it ascended the throne. Its subsequent history presents a series of tragedies of which that of Mary Stuart is only one, though the most famous. While the fate of kings excites the imagination, history must trace the growth of the nation and the slow changes which transformed the bulk of the Scottish people from loyal subjects to bitter enemies of their native kings and its kings from patriots to tyrants.

Robert
II.

Robert II. (1370-90), already fifty-four, continued rather than commenced his government on the death of David II., for he had been twice regent during David's exile and captivity. He did not ascend the throne without opposition, but the memory of Bruce was too fresh to admit of his settlement being put aside. The earl of Douglas, whose great estates on the border made him more formidable as a competitor than his claim by descent from a daughter of David, earl of Huntingdon, was conciliated by the marriage of the king's daughter Isabella to his son and by his own appointment as justiciar south of the Forth and warden of the eastern marches. This impediment removed, the coronation proceeded, and it was followed by a public declaration of the settlement of the crown on Robert's son John, earl of Carrick, at his father's death. A still more explicit settlement was made two years afterwards on the

king's sons by his first marriage with Elizabeth More,—John earl of Carrick, Robert earl of Fife, and Alexander lord of Badenoch; and failing them on those of his second with Euphemia Ross,—David earl of Strathearn and Walter his brother. A question as to the legitimacy of the children by Elizabeth More rendered this declaration necessary. The first fourteen years of Robert's reign passed with scarcely anything worthy of record. The king, whose portrait is drawn by Froissart as a man "not valiant, with red bleared eyes, who would rather lie still than ride," left the cares of government to his sons, especially the second. England, after the death of Edward III. (1377), was occupied with the necessary arrangements for a new reign and with the rising of Wat Tyler (1381). The absence of any movement in Scotland similar to this or the French Jacquerie perhaps indicates a better relation between the peasantry and the upper classes; but a third estate of the commons was as yet unknown in Scotland. John of Gaunt, who had invaded Scotland the year before, now took refuge there and was hospitably received in Edinburgh till the young Richard II., by putting down the rising, made it safe for him to return. This visit led to the first entrance into the northern kingdom of the principles of Wickliffe and the Lollards, whom Gaunt favoured. The French, still anxious to incite the Scots to attack England, sent a small party of free lances, who landed at Montrose and were allowed to make a raid on their own account. They were followed by John de Vienne with 1000 men-at-arms and many followers.¹ The licence of the French knights did not promote good feeling; but the interest of the two countries prevented a rupture. After the French left the Scots made another raid into Northumberland, in retaliation for an expedition in which Richard II. wasted the Lothians. Three years later, under the earl of Douglas, they attacked Newcastle, but were repulsed by Henry Percy, who, true to his name of Hotspur, in order to recover his pennon, pursued them to near Redesdale, about 20 miles from their own border, and fought the battle of Otterburn (1388). Douglas himself fell, but the victory went to the dead man, for young Percy and his brother were taken captive, and the bishop of Durham would not venture to intercept the retreat of the Scots. In 1388, Robert's inactivity increasing and his son the earl of Carrick being disabled by a kick from a horse, the earl of Fife was chosen regent by the estates under condition of annually accounting to them for his administration. In April 1390 his father died. His prosperous reign rather than any personal quality except an easy disposition gained Robert the praise of Wyntoun, who, writing under his son, prays God to give him grace

"To govern and uphold the land
In na war state nor he it fand,
For quhen his fadyr erdyt was
Of Scotland was na part of land
Out of Scottys mennys hand,
Outwith Berwick, Roxburgh, and Jedburgh."

This prayer was only partially fulfilled. The English did not acquire more of Scotland, but the border war was not so successful, and the royal house was the scene of tragic events which threatened to change the order of succession.

Robert III. (1390-1406)—for under that name the earl Robert of Carrick was crowned to avoid the hated name of John III.

¹ Froissart gives a vivid account of the poverty of the country and the rudeness of its people. "The people set little upon the distinction of their houses and said shortly how with three or four poles they would make them again. Edinburgh, though the king kept there his chief residence and it is Paris in Scotland, is not like Tournay or Valenciennes, for in all the town there are not 4000 houses." The men Vienne brought with him had to be lodged in Dunfermline, Kelso, Dalkeith, Dunbar. On his return he was asked by the young king Charles VI. how he fared; he said he had rather be count of Savoy or Artois than king of Scotland.

—was even less active than his father. He is briefly but truly described by an historian as a good man but not a good king. He scarcely reigned, for the regency of his brother continued after his accession till it was succeeded for a few years by that of Robert's son, on whose death the earl of Fife again became regent. There was a truce with England for nine years, during which the irrepressible love of fighting had to satisfy itself within Scotland. The king's younger brother, Alexander, called the Wolf of Badenoch, who had been created earl of Buchan, quarrelled with the bishop of Elgin and burnt his cathedral. The Wolf and his sons were constantly engaged in private wars. The earl died in 1394, but his son Alexander continued to defy the law, which the Government was too weak to enforce in the northern Highlands. Policy was used to suppress the violence of the clans. Such seems the explanation of the combat between thirty of the Clan Kay and as many of the Clan Chattan before the king on the North Inch of Perth, which ended in the slaughter of nearly all the combatants on both sides. In the council or parliament of 1398 a change was made in the Government due to the general distrust of Fife and the rising spirit of the earl of Carrick, the king's eldest son. The form of it was a compromise. The young prince was made lieutenant for three years, but with the advice of a council, of whom his uncle Fife was one; they were created dukes of Rothesay and Albany respectively, the first of that title in Scotland. Other acts of this council were designed to restrain the monarchy by constitutional laws. Parliament was to meet annually. The king, if accused of misgovernment or breach of law, might, "to excuse his defaults," arraign his officers before the council. No one was to ride through the country with more followers than he could pay for. The grant of £11,000 for the common weal and profit of the kingdom by the three estates—barons, clergy, and burghs—was made under protest that it was not to be a precedent, and the burghs stipulated that in future they were not to pay more than under Robert II. In the following year the revolution took place in England which led to the deposition and death of Richard II. and the accession of Henry IV. An impostor who had assumed the name of Richard took refuge in the Hebrides and was received at the Scottish court. The expedition of Henry to Scotland (1400), partly due to this, was also prompted by the desire to distinguish a new reign and by the invitation of the earl of March, indignant at the preference given to the daughter of Douglas over his own as wife for Rothesay. Reviving the old claim of feudal superiority, which was now supported by the forged charters of Hardyng as well as the fictions of Geoffrey of Monmouth, Henry cited Robert to do homage at Newcastle, and, on his failing to appear, marched to Edinburgh. Rothesay successfully defended the capital, and Henry was suddenly recalled by the rising of Owen Glendower and the Percies. Next year (1401) occurred the death of Rothesay by starvation at Falkland, where he had been committed by his father at Albany's instance on account of his bad government and dissolute conduct. The declaration of the council at Edinburgh, which acquitted Albany of all concern in the death, was enough for the moment, but in after times, like Bothwell's acquittal, a corroboration of guilt. The last years of Robert were clouded by private and public misfortune. His queen, Annabella Drummond, his son-in-law, the earl of Douglas, and Trail, bishop of St Andrews, one of the wisest of his council, died within a short interval. The son of Douglas, though brave, was unequal to the task of holding the border against the Percies and the earl of March, and so constantly lost battles that he was called Archibald Tyne-man. The Scots were signally defeated at Nisbet Muir

(14th September 1402) in Merse and at Homildon Hill 1390-1413. near Wooler by Percy, where the slain and prisoners equalled the number at Otterburn. Nor could order be maintained within Scotland itself, of which the forcible marriage of the countess of Mar by Alexander, a bastard of the Wolf of Badenoch, was an example. Afraid of Albany, and warned by the fate of Rothesay, Robert sent his remaining son James to France (1405); but the ship in which he sailed was taken by an English cruiser, and the future king was a prisoner in England for nineteen years. This last blow broke the weak heart of Robert, who died at Dundonald and was buried at Paisley. Though his reign was inglorious, the tradition of the War of Independence still warmed the heart of the nation and produced the earliest writers in Scottish literature,—Barbour, Fordun, and Wynthoun. The *Bruce* of Barbour became the national epic.

The year after Robert's death the first martyr in Scotland, James Resby, an English priest, was burnt at Perth by Albany, who is described by Wynthoun as "a constant Catholic." Resby was condemned at the instance of Laurence of Lindores, called the Inquisitor of Scotland, for forty theses from the books of Wickliffe. The Lollard doctrines continued to be secretly held by a small sect, chiefly in the west. Knox traces the descent of the first Scottish Reformers—the Lollards of Kyle—from Wickliffe and Hus. This religious movement was destined to exercise a profound influence on the history of Scotland. The time when the church was a civilizing and purifying power was passing away. Its enormous wealth, a contrast to its early poverty, its developed so different from its primitive doctrine, celibacy, and the confessional in a lax society, that was no longer moved by the fervour of a new faith, produced a corruption which forced itself on minds of a reforming tendency. Catholicism allowed no place for individual reformers, and their protests, often carried to extremes, were deemed attacks upon the church itself, which became (unwillingly on the part of its best friends) the defender of its worst abuses. From first to last in Scotland the movement was popular, though not at first democratic. It did not at all or only to a slight extent change through political causes as in England.

Though he was a captive, the right of James I. (1406-37) James I. on his father's death was at once acknowledged by a general council held at Perth; but the appointment of Albany as governor boded ill for his return. He held the office Albany's thirteen years, administering it till his death so as to conciliate all classes and pave the way to his own accession to the throne, which would have been his by right had the young king died. The recovery of Jedburgh (1408), long in the hands of the English, gave the regent an easy opportunity of popularity. It was decided by a general council that its walls should be razed and the expense defrayed by a poll tax, but Albany refused to burden the people and paid it out of the royal customs. Next year Albany and Douglas (now released from captivity in England) entered into a bond of alliance. With the earls of March and Mar and others similar engagements were made; but Douglas, who had acquired the lands of March, which, however, were now restored, had to be conciliated by a grant of Lochmaben and Annandale, the patrimony of the Bruces. The more independent nobles of the north could not be so easily gained, and Donald, lord of the Isles, disappointed in a claim to the earldom of Ross, invaded Aberdeenshire with a great host, whose defeat by the earl of Mar at Harlaw (17th May 1412)—the Otterburn of northern ballads—was followed by the capture of Dingwall, his chief castle on the mainland, and his final defeat at Lochgilphead.

The first Scottish university—St Andrews—was founded by bulls granted a year later at the instance of James and

1418-1427. Bishop Wardlaw, who had been his tutor. The higher education had already been to some extent supplied by cathedral and monastic schools; but Scots who sought a complete curriculum had to resort to Oxford or Paris. One of their number, Major, expresses his wonder that the Scottish prelates had not earlier thought of a national university. That now founded was destined to play an important part in promoting the Reformation and along with the later universities in civilizing Scotland.

Little of note occurred during the remaining years of Albany's regency. His futile siege of Roxburgh (1415), soon abandoned, got the name of the Fool's Raid. Greater credit attended the Scottish arms in France, where the earls of Douglas, Buchan, and Wigtown won battles for the French king, and lands and honour for themselves; but the defeats of Crevant and Verneuil effaced the honours of Beaugé (in Anjou), and, though the remnant of the Scots remained as the king's bodyguard, no considerable number of troops from Scotland afterwards went to France. Albany died at Stirling in his eightieth year (3d September 1419). His son Murdoch assumed the regency as if hereditary; but, himself indolent and with lawless sons, he did not retain the influence of his father. In 1423 ambassadors sent by the Scottish parliament to England at last arranged terms for the return of James from his long exile (12th May 1423).

Educa-
tion of
James I.

Exile had its uses, and, except at the beginning and again after the accession of Henry V., his captivity had not been rigorous. Sir John Pelham was his governor, and he was instructed in Latin grammar, oratory, and poetry, as well as in bodily exercises,—wrestling and the use of the spear. Though distinguished for physical strength, his bent was to the Muses, and he became proficient in dancing, music, and poetry. Buchanan blames this taste as carried beyond what became a king, but nothing in his after life showed he was ever led by amusements to neglect graver studies. When thirty he was taken by Henry V. to France with the view of detaching the Scottish allies of the dauphin, but refused to be made a tool of, saying he had as yet no kingdom and they owed him no allegiance. He proved his soldiership by the capture of Dreux. On his return to England he married (11th February 1423) Johanna Beaufort, daughter of the earl of Somerset and grand-daughter of John of Gaunt. In the *Kingis Quhair* he describes his love at first sight in the language of his master Chaucer, but with original genius. The marriage facilitated his release, which was negotiated for a sum of 60,000 marks. He confirmed the treaty at Melrose and was crowned with his bride at Scone (21st May 1423) by Wardlaw,—Albany, as earl of Fife, placing him on the throne.

He lost no time in addressing himself to the task of restoring the royal authority and the obedience to the law which the long regency had weakened. From this time dates the conflict between the king and the nobles,—the latter not maintaining, as in England, constitutional rights, but contending for exorbitant privileges. The experiment of government without a king had been tried too long not to make those who had exercised unrestrained power desire its continuance. The nature of the country—divided by rivers, mountains, and arms of the sea—the absence of great cities and the number of strong castles, the close connexion of the principal nobles by marriage and bonds of alliance, the large jurisdiction within their territories, the clanship not only in the Highlands and on the borders but in some measure throughout the whole country, which made fidelity to the chief a natural duty, strengthened the aristocracy and weakened the crown. The sovereign had to rely on the people and the clergy, on foreign alliances, on the influence due, partly to the virtues of his predecessors, partly

to the magic which in that age encircled the name of king. The first parliament of James at Perth passed quietly, but with indications of a policy long meditated and now to be put into operation. One Act forbade private war; another imposed the penalty of forfeiture of life and goods for rebellion; and a third directed an inquest by the sheriff what lands "pertain to the king or has pertained" in the time of the last three kings and in whose hands they now are. The choice of the privy council was significant. It was headed by Lauder, bishop of Glasgow, who had negotiated the king's release, but none of the greater nobles were included. In their stead appear an unusual number of minor gentry, some holding high offices. The parliament held at Perth in the following year was the scene of a *coup d'état* (12th March). Albany, his younger son Alexander, Alan of Otterburn his secretary, and Sir John Montgomery were seized on one day, and immediately after Isabella, Albany's wife, whose father, the earl of Lennox, had already been arrested. The only one of Albany's kin still at large, his youngest son James, made a short resistance, burnt Dumbarton, and slew the Red Stuart of Dundonald, the king's uncle, but, being hotly pursued, fled to Ireland. Parliament, at an adjourned sitting at Stirling, proceeded to the trial of Albany and his adherents, which was held with feudal solemnity before an assize. Albany, his two sons, and Lennox were condemned and executed on the Heading Hill. Clemency was shown to those who had not been his intimate supporters. Historians are divided as to the policy or necessity for such severity. But it secured its immediate object; it was felt that Scotland had again a king to defend his rights. James for twelve years carried out, not without murmurs, but without successful opposition, his projects of reform.

Foreign states recognized his power. At the request of James's the Flemish estates Middelburg was restored as the market for Scottish trade; in return the privileges of the Scots were guaranteed and Flemish merchants undertook to raise part of James's ransom. Flemish artisans and manufacturers settled in Scotland. More than one embassy passed to and from Rome with regard to the affairs of the Scottish Church, which James, while strictly repressing heresy (a Bohemian doctor, Crawar, being burnt as a disciple of Hus), showed his intention of reforming. The new pope Martin V. had put an end to the schism. The bitter enemy of the English king on account of the regulations which culminated in the Statute of Præmunire, he welcomed James's advances. James, while showing his attachment to the church by founding a Carthusian monastery at Perth and a Franciscan in Edinburgh, asserted his right to remedy abuses of the ecclesiastical courts, and addressed a letter to the Benedictine and Augustinian monks reproaching them for laxity. To Erik of Norway he sent an embassy and obtained a commutation of the arrears due for the Hebrides under the treaty of Largs. A marriage between the dauphin and Margaret, his infant daughter, previously arranged, was celebrated shortly before his death. He thus established friendly relations with the Continent, and, though his position as regards England could not be the same, the truce was only twice broken towards the end of his reign—by a raid of the English, who were defeated at Peferden (1425) by the earl of Angus, and his own attempt to recover Roxburgh. During the fourteen years of his actual reign James held thirteen parliaments, proving his desire to obtain the support of the nation in his reforms. In 1426 he introduced the session, a royal court for civil causes sitting in the principal towns, to provide the justice too often denied in the baronial courts. Next year he summoned a parliament to Inverness—an unusual

Subjuga-
tion of
High-
lands

place of meeting—for the purpose of restoring the peace of the Highlands. Its records are lost; but the chief event was the seizure of Alexander, earl of Ross, lord of the Isles, and his mother, along with as many as forty chiefs. Two were beheaded and a third hanged, but most of them, including the lord of the Isles, after a short imprisonment, were released. Ross at once raised the standard of rebellion and burnt Inverness, but was defeated by James at Lochaber, where the clans Chattan and Cameron deserted to the royal side. On the Sunday following the former killed in a church the whole of the latter clan who were present. Another internecine conflict took place in Caithness seven years afterwards. Such private feuds, traditional amongst the Celts, were one cause of the success of James and of the ultimate subjugation of the Highlands. So completely was the power of the lord of the Isles broken that he came as a suppliant and placed his sword in the king's hands at Holyrood. His life was spared, but he was confined to Tantallon castle. In a parliament held later in the same year at Perth an Act was passed for the representation of the shires and the election of a speaker; but this imitation of the English House of Commons was not acted on. The Scottish parliament continued to sit in one chamber of lords, clergy, and commons, and it was only in the reign of James V. that representation of the shires was admitted. The following parliament (1428) provided that an oath of fealty should be taken to the queen by all persons succeeding to lands or dignities, which shows that James knew the danger of his policy. In 1429 an Act was passed for the protection of the tillers of the ground, who were not to be removed for a year, and provision was made for arming all landowners and burgesses. The birth of twins—Alexander, who died young, and James, afterwards king—strengthened the king's position by interposing two lives besides his own against any attempt at revolution. Two years later Donald Balloch, a kinsman of the lord of the Isles, renewed the rebellion; but, though he defeated Mar and Caithness, on the approach of James himself he fled to Ireland.

Dealings
with his
nobles.

In 1434 the king applied the statute of his first parliament as to the resumption of lands to which no sufficient title could be shown. The estates of the earl of March were forfeited on the ground that Albany had exceeded his power in restoring them. He was created earl of Buchan with the intention no doubt of removing him from the border and conciliating him for his loss. The death in 1435 of Alexander Stuart, earl of Mar, led to the lapse of that earldom to the crown on account of his bastardy, and the following year the earldom of Strathearn was resumed on the ground that it was a male fee and did not pass to the wife of Patrick Graham, the heir-female. It was bestowed in life-rent on the king's uncle, the earl of Athole, and Malise, the son of Patrick Graham, was made earl of Menteith. This assertion of right on the part of the king to deal with the estates of the nobles though fortified by legal documents and recognized possession was certain to make enemies. It is more surprising that James so long succeeded in maintaining his authority than that he at last perished for doing so; but he had the people on his side. In the summer of 1436 he was obliged to relinquish the siege of Roxburgh owing to the barons' refusal of support. In October when the forfeiture of Strathearn was made in a parliament at Edinburgh, Sir Robert Graham, uncle and tutor of the young heir Malise, denounced the king in the boldest terms and urged the barons to seize his person; but, failing, he was banished from the court. As in other cases, this leniency was not required. In his Highland retreat Graham formed a conspiracy with Athole, the king's uncle, who aimed at the crown, and Sir Robert Stuart, Athole's grandson. James

was to spend Christmas at Perth. Before he crossed the Forth he was warned by an old Highland woman that if he passed he would never return. She tried unsuccessfully to get access to him again at the Dominican monastery at Perth, where he lodged. At midnight, when he was half undressed, Graham with 300 men surrounded the monastery. Their approach was heard; but it was found that the bolts had been removed by treachery. James was hastily concealed in a vault underneath the room. Before the conspirators entered a brave attempt was made by Catherine Douglas, one of the queen's maids, to bar the door with her arm, but the fragile obstacle broke and Graham burst in. The fall of another of the maids into the vault discovered the king, who fought fiercely for his life. The queen was wounded in trying to save him, fulfilling an unconscious prophecy of the *Kingis Quhair*. At last, after killing two of his assailants, he fell, overcome by numbers (February 1437). Vengeance speedily overtook the murderers, who had made no provision to follow up their deed. Within a month they were all executed in a manner exceeding even the barbarous usages of the time. James was buried in the Carthusian monastery, where his doublet was long kept as a relic and seen by the people with veneration. Such was the sad fate of the best of the Stuarts,—a king in advance of his age and too rapid in his reforms.

James II. (1437-60), an infant of six, called "Fiery-face" James from a red stain on one cheek, was crowned at Holyrood II. five weeks after his father's death, and there commenced one of the long minorities which the early deaths of the Stuart kings made common, and during which history is chiefly occupied with the contest for the person of the king. These have been truly represented as weakening the royal authority. The possession of power rendered the nobles impatient of restraint and accustomed to licence; but they had also a reverse effect. When the monarch succeeded he was received with favour by the people as a deliverer from the oppression of the barons, too often petty tyrants. A rule of law allowing him to revoke grants in his minority was often used with great effect. On the whole, monarchy, in spite of the weakness and vices of the kings, was popular in Scotland until the Reformation and the fatal chain of events in which Mary was involved introduced a democratic tendency, which grew under the bad government of her successors. The nobles, though their word was law with their kinsmen and retainers, were seldom favourites of the people. Archibald, fourth earl of Douglas, the greatest of the Scottish nobility and duke of Touraine in France, was lieutenant-general of the kingdom from James's accession till his own death the year after; but Sir William Crichton, master of the household of James I., who was keeper of the castle of Edinburgh, where the young king was detained, appears to have exercised the chief power. Shortly after the death of Douglas James's mother carried off her son, on the pretext of a pilgrimage, to Stirling, of which Sir Alexander Livingstone of Callander was governor. Livingstone laid siege to Edinburgh, but made terms with Crichton, who became chancellor. The alternate struggles and reconciliations of these rivals continued till James was fourteen, when he favoured Douglas (the eighth earl) in order to free himself from their control. This was a time of civil or rather of private wars. The only contemporary chronicle marks almost every year with the seizure of a castle or a party fight. Douglas brought the earl of Crawford and his retainers from the Highlands, who ravaged the estates of the bishop of St Andrews, and himself besieged Edinburgh castle. The castle surrendered; but Crichton, one of the adroit statesmen who rise after every fall, continued chancellor, and soon after, by negotiating the marriage of James with Mary of Guelders (1448), ensured his favour with the court. Shortly after the cele-

Struggles
for re-
gency.

1448-1466. bration of this marriage Livingstone, now chamberlain, with many of his kindred and friends, was suddenly arrested and tried before a parliament at Edinburgh; two were executed, and the others, including the chamberlain, attainted and placed in strict ward in Dumbarton. Douglas and Crichton received part of the forfeited estates. James was chiefly advised at this period by Bishop Kennedy, whose counsel was the old one of "divide et impera." He now determined to do to the more powerful Douglas as he had done to the Livingstones. The earl had shown no moderation in prosperity. His revenue and retainers equalled those of the king: 1000 horsemen were his ordinary train, and he attended the king's marriage with five times that number. His courts on the borders were almost parliaments. In the year of jubilee (1450) he went to Rome with a large suite. On his return he visited the new king of England, Edward IV. At the parliament of Edinburgh (1451) he submitted to the king's mercy, and at the request of the queen and estates received a regrant of his lands and honours. He was already suspected of treason, and had in fact renewed a secret bond with the earls of Crawford and Ross, the most powerful nobles in the north, which threatened the royal authority. James felt a crisis had come and summoned Douglas to Stirling at Shrovetide. There the young king, in violation of hospitality and a safe conduct which he had given the earl, when Douglas refused to break the bond with the other earls, struck him with his knife and killed him (21st February 1452).¹ An appeal to arms necessarily followed. Douglas's brother James, the ninth earl, came to Stirling and burnt great part of the town. But the clergy and commons and other nobles, some even of Douglas's own kin, not sorry at the fall of one who overtopped them, stood by the king. Parliament sanctioned James's act and declared Douglas had deserved death. At length, after repeated struggles, Crawford was defeated at the Muir of Brechin and Douglas fled to England. His estates were of course forfeited. The lordship of Douglas was granted to Angus. Ettrick Forest and Galloway were annexed to the crown. Some years later Douglas made another desperate effort against James, but after wasting Merse was totally defeated by Angus (1458).² The energy of James in visiting all parts of his kingdom was conspicuous during the last period of his reign. The good relations with the French and other Continental courts continued. With England—one brief interruption excepted—peace had been preserved during the reign of Henry VI. Henry even agreed to restore Roxburgh and Berwick to Scotland in return for assistance against the duke of York. When Henry was taken prisoner at Northampton, his queen and her young son fled to Scotland, and James was called on to fulfil his engagements. He laid siege to Roxburgh, which for more than a century had defied his predecessors, and after a stout resistance it was taken; but James did not live to enjoy the triumph. When inspecting the discharge of a new gun it burst, and he was killed (3d August 1460). He had not reached his thirtieth year.

His reign had been singularly fortunate, for he succeeded (where his father failed) in restoring the royal authority and reducing the power of the nobles. This may have been

¹ The origin of two great families dates from the fall of Douglas. Sir James Hamilton of Cadzow deserted his kinsman for the king and received large grants of land and the king's daughter as wife. Sir Walter Scott of Kirkcud and Buccleuch, a border chief, was similarly rewarded. These were the ancestors of the dukes of Hamilton and Buccleuch.

² In the next reign along with the king's banished brother, Albany, he made a daring raid on Lochmaben, but being taken prisoner he ended his days as a monk at Lindores. A saying attributed to him, "If a man cannot better be, he may be a monk," was a sign of the change of times since Celtic kings were proud to assume the cowl.

partly due to the counsels of Kennedy, bishop of St Andrews, and Crichton; but James showed skill in government and vigour in war, though the murder of Douglas has left a stain on his character. The crown was richer at his death than it had been since the time of Alexander III., by many forfeitures secured from alienation by the Act of Annexation (1455, c. 41). The royal prerogative was strengthened by the first statute defining treason (1449, c. 25). Provision was made for the execution of criminal justice by the king, his justiciar, and sheriffs, and of civil justice by the session. Stringent rules were laid down against violent spoliation of lands and goods (1449, c. 30). The coinage was regulated, an attempt made to preserve its standard, and to prohibit export of gold and silver (1451, c. 23). Towards the end of the reign, when war with England was impending, statutes were passed for the defence of the borders, giving the king more direct control, and declaring that the office of warden should not be hereditary. The progress of agriculture was furthered by the famous Act for the encouragement of feu farm, an existing form of tenure becoming more common, and another giving fixity of tenure to leases until the expiry of their terms notwithstanding alienation of the lands. There were also many minor laws which had for their object the welfare of the people. Though the legislation of James II. was not so large, it was perhaps as important as that of James I.

On the Sunday after his father's death James III. (1460-88) was crowned at Kelso. A regency was formed consisting of the queen, Kennedy, and others. A parliament followed at Edinburgh, which was blamed by the nobles for leaving so much power in the hands of a woman; but there was a full appointment to the offices of state, and, though Mary of Guelders aimed at more than the guardianship of her son, it does not appear that she really exercised royal authority. After the defeat of Towton (29th March 1461), Henry VI. and his queen took refuge in Scotland. In return for their reception and in hope of further aid, Henry surrendered Berwick (23d April) to the Scottish king, in whose hands it remained till its final annexation to England at the close of the reign. Edward IV. retaliated by a treaty (13th February 1462) with the banished earl of Douglas, the earl of Ross, lord of the Isles, and Donald Balloch, by which Douglas was to be restored to his estates, and the whole country north of the Forth divided between the two Highland chiefs. George, earl of Angus, who had risen on the ruins of the house of Douglas, made a counter-league with Henry VI., by which he was promised an English dukedom and valuable lands between Trent and Humber, but was to preserve his allegiance to the Scottish king. These were paper promises, and all that came of them were an ineffectual rising in the north and the relief of Alnwick, which had been besieged by the Yorkists. Next year the Lancastrian cause having received a fatal blow by the defeat of Hexham, a singular offer by Edward IV. to marry the queen dowager of Scotland—one of the many schemes of the king-maker, earl of Warwick—was frustrated by her death or perhaps by the discovery of an intrigue with Adam Hepburn of Hales, whose wife was alive. Kennedy, who had the chief control of Scottish affairs, negotiated the release of Alexander, the king's brother, who had been taken by an English cruiser, and secured a truce between England and Scotland for fifteen years. He understood the nature of his countrymen better than any man, and was always ready to give counsel in parliament, while his learning, especially in the civil law, made him respected by foreign powers. When he died the country wept for him as for a parent.

Before his death a plot had been formed which threw the young king into different hands. Amongst the barons

who received office at the commencement of the reign one of the foremost was Robert Boyd of Kilmarnock, the justiciar. Boyd determined to play the part of Livingstone in the last reign, and usurp the supreme power by seizing the person of the king. Bonds with this object were entered into between him, Fleming of Cumbernauld, Lord Kennedy, a brother of the bishop, and others. While holding a court at Linlithgow James was carried off to Edinburgh by Boyd. Kennedy made a feint to save him by seizing his bridle, but was overpowered; perhaps the attempt was real, for Kennedy afterwards separated from the Boyds. In parliament Boyd went through the form of asking pardon of the young king in presence of the estates, and was immediately entrusted with the custody of the royal person (October 1466) and that of his brothers Albany and Mar, as well as the fortresses of the kingdom. Next year he was made chamberlain, which gave him control of the revenue. The marriage of his son Thomas, created earl of Arran, with the king's sister Mary, marked the height of his ambition. The fall of Boyd, as sudden as his rise, whom with his brother Alexander James at first favoured, was due to the same cause as that of Livingstone,—the king's marriage and his desire when major to assert his independence. Negotiations for an English match having fallen through, an alliance with a Norwegian princess was determined on, and an embassy sent to Norway by parliament. Christian of Denmark and Norway readily assented. He promised his daughter a dowry of 60,000 florins, besides a surrender of the claim of arrears of the annual payment for the Hebrides. But, as it was inconvenient to pay the dowry, both the Orkneys and the Shetlands were mortgaged to Scotland, and have remained ever since under the Scottish crown. Two years later (July 1469) the princess Margaret arrived in Scotland, when the marriage took place. Arran on his arrival at Leith with the king's bride received a message from his wife warning him that James had conceived a great hatred against him; accordingly he fled to Denmark. In the parliament his father and his uncle, Sir Alexander Boyd, were attainted. The chamberlain saved himself by flight; Sir Alexander was executed. The specific charge made was the seizure of the king's person; but a general clause had reference to the immense estates they had annexed. The king's sister, divorced from Arran, was married to Lord Hamilton, who thus laid the foundation of a family whose head more than once aspired to the crown.

Govern-
ment by
favour-
ites.

The refusal of parliament in 1473 to sanction the proposed passage of James to France, to aid Louis XI. against Charles the Bold, on the score of the expense and risk, was the first indication of the difference between the king and the nobility which led to the disasters of the close of his reign. The parliament of 1476 took a bolder step. At its adjournment it committed its whole powers to certain members, of whom the duke of Albany and the earl of Mar, the king's brothers, were the principal,—a measure which indicated a want of confidence in the king. He had shown himself, like Louis XI., disposed to govern by new men who owed their elevation to himself,—a policy which alienated the aristocracy. Of these favourites the chief were Robert Cochrane, originally, it was said, a mason, who proved himself a skilful architect; Roger, an English musician; and Andrews, a physician, who dealt in astrology,—all able to gratify tastes of James. There were besides a few young men of birth who gained favour by flattery or other arts. Cochrane became all powerful and disgusted the nobles by sumptuousness and arrogance, and the people by debasing the coin. He succeeded, it was reported, by relating a prophecy that a lion should be devoured by its whelps, in producing in the king's mind an aversion to his brothers, whose characters and knightly

accomplishments made them popular. James seized Mar 1466-1488. and sent him to Craigmillar castle. He soon after died (1479) in Edinburgh under circumstances which gave rise to suspicion of foul play. The gift to Cochrane of the vacant earldom or its revenues strengthened the suspicion of his complicity. Albany, committed to Edinburgh castle (1480), escaped to Dunbar and thence to France. He there married Anne de la Tour d'Auvergne, whose son was the regent Albany in the reign of James V. Failing to induce Louis to do more than urge his restoration, two years afterwards he quitted France and at Fotheringay entered into a treaty (1482) with Edward IV., by which, in return for the empty title of Alexander IV., he owned the subjection of the country to England and made other humiliating promises. Supported by the earl of Gloucester and the exiled earl of Douglas, Albany laid siege to Berwick, while James collected his forces on the Boroughmuir of Edinburgh and advanced to Lauder. There the chief nobles, indignant at the favour shown to Cochrane, mutinied, and, led by Angus, who then acquired his name of "Bell the Cat," seized Cochrane and some of the other favourites of James and hanged them before his eyes. Berwick fell and was never afterwards recovered by the Scots. The nobles, distrusting Angus, who had made secret terms with Albany and the English king, were induced by Schivas, the archbishop of St Andrews, to effect a reconciliation between the king and his brother, who received the vacant earldom of Mar and for a little became chief minister. A parliament in December appointed Albany lieutenant-general, but his continued intrigues with the English king being discovered he was attainted for treason and fled to England (1483), and thence to France. James had now a brief period of peace, during which the revolutions in England freed him from the danger of war in that quarter. New matrimonial projects were tried. It was proposed that the prince of Scotland should marry a niece of Richard III., Anne de la Pole, daughter of the duke of Suffolk, and after Richard's deposition a marriage with Elizabeth, daughter of Edward IV., was suggested. On the death of Queen Margaret James himself made an offer for the hand of the widow of Edward IV. Such proposals, though abortive, were signs of a better understanding between the two countries, or at least between their sovereigns. When the rebellion broke out in the following year the nobles and James accused each other of treasonable correspondence with England, but no assistance was got by either, for England was still scarcely released from its own civil war. In 1487 the greater part of the Scottish barons rose in arms. James had abandoned himself to another favourite, Sir John Ramsay, whose life had been spared at Lauder. The chiefs of the party were the earls of Angus and Argyll, Blackadder, bishop of Glasgow, and the Homes and Hepburns, powerful barons on the border. Having seized the person of the young prince, whom they already designated king, they pretended to act in his name. James retreated to Aberdeenshire, for the northern barons still adhered to him. Father and son, at the head of their respective forces, first met at Blackness (May 1488) on the Forth, where a pacification was agreed to on terms which showed the king's party was the weaker. In the following month the rebellion was renewed and the king was slain at Sauchie (11th June), within sight of Bannockburn. He was buried at Cambuskenneth, being only thirty-five years of age. He did not fall, like his father, through the strength of the nobles, for they were much divided, and he commenced his independent reign master of the situation. The Wars of the Roses gave him an opportunity, which he missed, of strengthening his kingdom in relation to England, whose monarchs adopted a new attitude

1488-1512. towards Scotland from that of the Plantagenets,—seeking alliance rather than war. His own weakness, his love of favourites and of money, his passion for music and art—perhaps inherited from his grandfather, but carried to excess and not counterbalanced by the qualities of a statesman and general—proved his ruin. The rebellions, first that of his brother, then that in the name of his son, were fatal precedents in the reign of Mary Stuart.

James
IV.

James IV. (1488-1513) was already sixteen when crowned at Scone. His reign is an interlude in the record of almost constant battles, murders, and executions with which Scottish history abounds. There were not wanting causes of offence between England and Scotland, but the politic Henry VII. avoided war and effected what previous kings had failed in the marriage between the royal houses. James, a popular monarch, succeeded better than any of his predecessors and successors in keeping on good terms with all classes. His court was one of splendour for a small country; indeed Scotland, almost for the first time, possessed a court which set the fashion of civilization and culture. The death of James III., instead of exciting the horror awakened by the death of James I., was treated with indifference, almost as a relief. The chief offices of state were distributed amongst the supporters of the young king. The first business of the parliament, which met in Edinburgh, was the treason trials. The persons put on their trial were not those who fought against but those who supported the late king. Several were condemned, but prudently treated with great leniency. All were charged with correspondence with England as well as with their presence at the field of Stirling (Sauchie). There followed a curious transaction called in the records "the debate and cause of the field of Stirling,"—the first debate in a Scottish parliament of which we have any account. The result was a unanimous resolution "that the slaughter committed in the field of Stirling, when our sovereign lord's father happened to be slain, was due entirely to the fault of him and his privy council divers times before the said field." There was not a single execution. Heritable officers who had fought against the prince were only suspended, not deposed, and the heirs of those slain were by special grace admitted to their estates. The only person who felt compunction was the young king. His frequent pilgrimages and an iron belt he wore were due to his remorse for his father's death. The leniency of James was rewarded by the loyalty of the nobility, except a few northern barons headed by Lennox and Huntly, and these, after being defeated by James in the following year, were also treated with clemency. The only trace of rebellion during his reign was a secret intrigue between Henry VII. and Angus, who succeeded to the traditionary policy of the Douglasses.

Legisla-
tion.

A determined effort was made by parliament to put down robbery and theft by special commissions to certain lords who were to be responsible for different districts. It was provided that the king in person should attend the justice air (eyre),—a provision which James acted upon. A new master of the mint was appointed to restore the purity of the coinage. The penalty of treason was to be imposed on those who purchased benefices from Rome. An active spirit of reform, a desire to remedy the evils of the late reign, was displayed by both the king and his advisers. The personal character of James showed itself in a liberality contrasting with his father's avarice, and in a love of chivalrous display encouraging tournaments and martial exercises, as well as in the care of the navy.

Forma-
tion of a
navy.

From the time of Bruce we hear of ships and shipbuilding, natural in a country with so large a seaboard; Scottish merchantmen now began to make distant voyages, and their ships, half privateers, half traders, were commanded

and manned by sailors who were a match for those of any country. The most famous commander, Wood of Largo, with the "Flower" and the "Yellow Carvel," cleared the Forth of English pirates. Stephen Bull, an English captain, promised to take Wood dead or alive, but was captured himself; James sent him back to Henry VIII. with a chivalrous message that the Scots could now fight by sea as well as land. Wood was made one of the king's council. By his advice James built the "Great St Michael" for a crew of 300 and 1000 men-at-arms. It exhausted all the woods in Fife except Falkland, and cost £30,000. The king's policy was not confined to building ships of war: every town was to have vessels of at least 20 tons. The navy was for the protection of trade, to which the national instinct pointed as a source of wealth.

The marriage of James early attracted the attention of parliament, and embassies were sent to foreign courts to seek a suitable spouse; but James had formed a connexion with Lady Margaret Drummond, and could not be persuaded to a political alliance. The chief events of his reign prior to his marriage to Margaret Tudor were his expeditions to the north-east and the western Highlands. He adopted with the chiefs a similar policy to that which had succeeded with the barons, attaching them to his person by gifts, offices, and favours, and committing to them the suppression of crime. In 1496 the impostor Perkin Warbeck came to Scotland and was recognized by James, who gave him his kinswoman, Catherine Gordon, daughter of the earl of Huntly, called for her beauty the White Rose, in marriage. Raids were twice made across the border on his behalf, but there was only one engagement of any consequence, at Dunse (1497), and an unsuccessful siege of Melrose. Henry VII., whose talent lay in diplomacy, ap- James's
proached the Scottish king with the tempting offer of the marriage
hand of his daughter Margaret. Commissioners met to Mar-
consider this at Jedburgh, and, though James refused to garet
give up Perkin Warbeck, a truce was arranged, and Perkin Tudor.
left Scotland. The marriage of James and Margaret was soon afterwards agreed to and a peace concluded. The papal dispensation was procured in 1500, but the final treaty was not ratified till two years later (8th August 1502). Some of Henry's counsellors sought to dissuade him from the marriage, for if his son Henry died James would be next in succession to the English throne; but he replied that if so Scotland would be an accession to England and not the reverse, recalling the example of Normandy and England. Margaret, a girl in her fourteenth year, made a triumphal progress to Scotland, where she was received with pomp; but the marriage was one of policy, and the young wife was discontented with her new country and her husband. Their court as it is painted in the poems of Dunbar was merry, but not moral. The licence which prevailed and was tolerated by the church was shown by the elevation of one of the king's bastards by Jane Kennedy to the archbishopric of St Andrews when a youth of eighteen. Others received rich benefices, and Jane Kennedy herself married the earl of Angus. Scottish history during the six years after the king's marriage was uneventful.

Henry VII.'s death (1509) changed the relations between Warwith
Scotland and England. Henry VIII. had not liked his England.
sister's marriage, and his refusal to deliver to her a legacy of jewels left by his father led to a coolness. The mutual attacks of English and Scottish privateers and border frays increased the bad feeling. Andrew Barton's ship the "Lion," after an obstinate conflict, in which Barton was killed, was seized (1512) in the Downs by the sons of Howard, the English high admiral, and James's request for redress was met with the contemptuous answer that kings should not dispute as to the fate of pirates. But it

was Henry's Continental policy which in the end provoked the war. The struggle in Italy between Louis XII. and Pope Julius II. gave him an opportunity, and he allied himself with the latter and invaded France. He attempted before leaving England to secure peace with Scotland by promising to redress its grievances. But James had renewed the old alliance with France, and the only answer given to the first embassy in 1512 was an offer to mediate between France and England. In 1513 the message was, that if Henry passed to France war would not be declared without a herald being sent. The French queen (Anne of Brittany) had given James a ring with a substantial subsidy, and he had already made up his mind for war. Like Henry, he longed to win his spurs. Henry went to France in June, and soon after his arrival at the camp at T rouanne, the Scottish Lord Lyon brought the threatened declaration of war (11th August 1513). The grounds stated were the seizure of Scotsmen on the borders, the refusal of Margaret's legacy, and the death of Barton. No time was lost by James in carrying the declaration into effect; but the war was disliked by the nation. The earl of Arran, sent with the fleet to aid the French, sailed instead, in defiance of orders, to Carrickfergus. James himself called out the whole land force contrary to the advice of his council, mustering at the Boroughmuir 100,000 men according to English accounts—probably exaggerated, but doubtless as large an army as had been seen in Scotland. Crossing the border, he took Norham, Wark, and Ford. At the last of these castles the wife of Heron, the proprietor, then a prisoner in Scotland, beguiled James by her beauty, causing him to waste several days and betraying his movements to the enemy. In the conduct of the battle of Flodden. (9th September 1513) which followed he committed almost every fault a general could commit,—neglecting to engage when the enemy were crossing the Till, allowing himself to be outflanked by Surrey, who got between him and the Scottish border, abandoning his strong position on the hill of Flodden, and finally exposing his own person on foot in the centre of the fight. Some Scottish writers claim that the battle was a divided success and that the total number of English killed was greater; but Hall, an exact chronicler, says 12,000 Scots fell and only 1500 English, as appeared from the book of wages when the soldiers were paid. What made Flodden so great a disaster was the quality of the Scottish loss. The king himself, his son, the archbishop of St Andrews, two bishops, two abbots, twelve earls, and fourteen lords, besides many knights and gentlemen, were left on the field. There was scarcely a noble family which did not mourn some of its members. Surrey did not follow up his victory by invading Scotland, since his object was gained: the diversion by the Scots in favour of France was at an end. Scotland was again left with an infant king, scarcely more than a year old.

Flodden.

Charac-
ter of
James IV.

The character of James IV. was on the surface. An excellent observer, the Spanish ambassador Ayala, notes his good looks and agreeable manners, his knowledge of languages and history, his respect for the service of the church and its priests, his liberality and courage, "even more than a king should have, not taking the least care of himself," his bad generalship, "beginning to fight before he had given his orders," and his wise statesmanship, deciding nothing without counsel, but acting according to his own judgment, which was generally right.

Scottish
learning
at this
epoch.

The reign of James fell within the era of the revival of learning, and Scotland, though late, came within the circle of the intellectual which preceded the religious reformation. It was common for Scottish scholars to complete their education and sometimes to remain teaching in the universities of France. One of these, Elphinstone, bishop of Aberdeen, who founded its university, brought another,

Hector Boece, the historian, to be first principal of King's 1512-1516. College, Aberdeen. James himself engaged Erasmus as tutor to his son, the future archbishop. Two other Scotsmen passed to Paris in the beginning of the next reign, John Major and his pupil Buchanan, who brought back less of the critical but more of the Reforming spirit. These and other learned men neglected a reform as essential as any,—the use of the mother-tongue in their writings, and the neglect has lessened their fame; but it had its exponents in Dunbar, Henryson, Sir David Lyndsay, and Gavin Douglas. The printing press also found its way to Edinburgh, and Chepman and Myllar published their first broad-sheets with works of Dunbar, Douglas, and the remains of the older poetry (see p. 540 *sq.* below).

7. *The Reformation, its Antecedents and Consequences.*—James V.

James V. (1513-42), scarcely eighteen months old when he succeeded, was at once crowned at Scone, where a parliament met, chiefly attended by the clergy. The queen dowager was appointed regent,—a secret message, however, being sent to John, duke of Albany, to come from France and assume the regency. The son of the exiled brother of James III., Albany had by his marriage to his cousin, the heiress of De la Tour d'Auvergne, become a great noble in France, where he held the office of high admiral, and neither he nor the French king, Louis XII., was willing that he should quit France. The Sieur de la Bastie came as his representative. The precipitate marriage of the queen, four months after the birth of a posthumous child, to the young earl of Angus, and a dispute as to the see of St Andrews, to which Margaret appointed Gavin Douglas the poet, her husband's kinsman, although Hepburn the prior had been chosen by the chapter, led the Scottish estates to renew their request that Albany should come to Scotland. He arrived at Dumbarton on 18th May 1515 and was at once appointed regent. The queen refused to give up her Regency son, but Albany besieged Stirling and forced her to sur-^{of} render. Her new husband fled to France, and Margaret Albany. first to Dacre, warden of the marches, and then to her brother's court, where she was joined by Angus. At Harbottle in Northumberland, on her journey south, she bore a daughter, Margaret Douglas, afterwards Lady Lennox, Darnley's mother. Henry VIII. asked the Scottish parliament to remove Albany from the regency, but was met with a decided refusal; for, though a party of nobles, especially the border barons Lord Hume, the chamberlain, and his brother, were opposed to him, he was supported by the nation. The young duke of Ross, Margaret's younger son, having died suddenly, Albany procured a declaration from parliament that Ross's elder half-brother was illegitimate and himself next heir to the crown. Hume and his brother were seized and executed at Edinburgh (26th October 1516). These events aroused suspicion that Albany aimed at the crown; but the suspicion appears to have been unfounded. His tastes were French; hence he quickly tired of trying to govern Scotland, and in autumn obtained with difficulty leave of absence for four months. Before leaving he put Dumbarton, Dunbar, and Inchgarvie (in the Forth) in charge of French garrisons under De la Bastie, who held the post of warden of the marches; but an interim regency was appointed. Margaret now returned to Scotland; but she was not permitted to take part in the government. Shortly after his arrival in France Albany negotiated the treaty of Rouen (20th August) by which an alliance between France and Scotland was agreed on against England, and a promise given that the Scottish king should marry a daughter of Francis I., or if that failed another French princess. In September De la Bastie was murdered near Dunbar by Hume of Wedderburn with the connivance of Dacre. The perpetrators were forfeited, but never brought to justice, although

1516-1534. Arran, who succeeded to the office of warden, was sent for that purpose. The absence of a supreme authority gave free scope to the licence of the nobles.

See Plate VI. A serious rising in the Highlands to support the claim of Macdonald of Lochalsh to the lordship of the Isles lasted for several years, till the death of the claimant and the vigour of the earl of Argyll, the head of a house now rising into pre-eminence, led to its suppression. The chief disturbances arose from the ambition of Angus: Archibald, his uncle, was chosen provost of Edinburgh; his brother William seized the priory of Coldingham; his uncle Gavin, though he failed to secure the primacy, retained the see of Dunkeld. Angus was supported by the earls of Crawford, Erroll, and Glamis, by Forman, archbishop of St Andrews, and most of the other bishops, except James Beaton, archbishop of Glasgow and chancellor. The English warden, Dacre, was also on his side and tried by intrigue and bribery to foment dissension and prevent Albany's return. The opposite faction was headed by Arran, Lennox, Eglington, Cassilis, Semple, the bishop of Galloway, and the chancellor. Scotland was thus divided between an English party, strongest in the east, and a French party, chiefly in the west. Their disputes reached a crisis in a street fight in Edinburgh, which got the name of "Cleanse the Causeway" (30th April 1520), in which Angus drove Arran out of the town and seized the castle. Sir Patrick Hamilton, a brother of Arran, was slain by Angus,—an injury never forgiven. Meantime Margaret quarrelled with her husband, and, though there was a temporary reconciliation, mutual accusations of infidelity were too well grounded to permit of its being permanent.

Supremacy of Angus. Next year Albany returned and the queen, who had been in secret correspondence with him, entrusted him with the custody of the young king. Henry VIII. again requested the Scottish parliament to expel Albany; but they again refused, and Angus made terms with Albany on condition that he should himself withdraw to France. War was now declared between England and Scotland (1522); but, although Albany advanced with a large army as far as Carlisle, he was persuaded by Dacre to a month's truce and soon after went back to France, leaving the king in charge of a regency of which Beaton, Arran, Huntly, and Argyll were the leaders. Albany returned in the following year and again with a large force invaded England, but failed to take Wark, while Surrey, the English commander, ravaged the border. This failure lost Albany his credit with the Scots. In 1524 he went to France on condition that if he did not come back before 31st August his regency should end. He never returned, and during his absence Margaret carried off her son from Stirling to Edinburgh, where, although only a boy of twelve, he was declared king. Angus made an agreement with Wolsey to support the English interest; and at a parliament in Edinburgh Albany's regency was declared at an end (12th February 1525), and Angus and Beaton obtained possession of the king's person and governed in his name. The queen, who had now openly broken with her brother, in vain appealed to France and Albany. The French were occupied with the war against the emperor; but she obtained from James Beaton, now archbishop of St Andrews, a divorce from Angus and married Henry Stuart, son of Lord Avondale, creating him Lord Methven.

For three years Angus retained the supreme power and filled all offices with his adherents. Beaton, with whom he quarrelled, was required to resign that of chancellor, and Angus nominated himself as his successor. The indignant nobles made unsuccessful attempts to seize the person of the king, who at last, on 23d May 1528, effected his escape from Falkland, riding at night to Stirling, where he was welcomed by the governor. Before parliament met a pro-

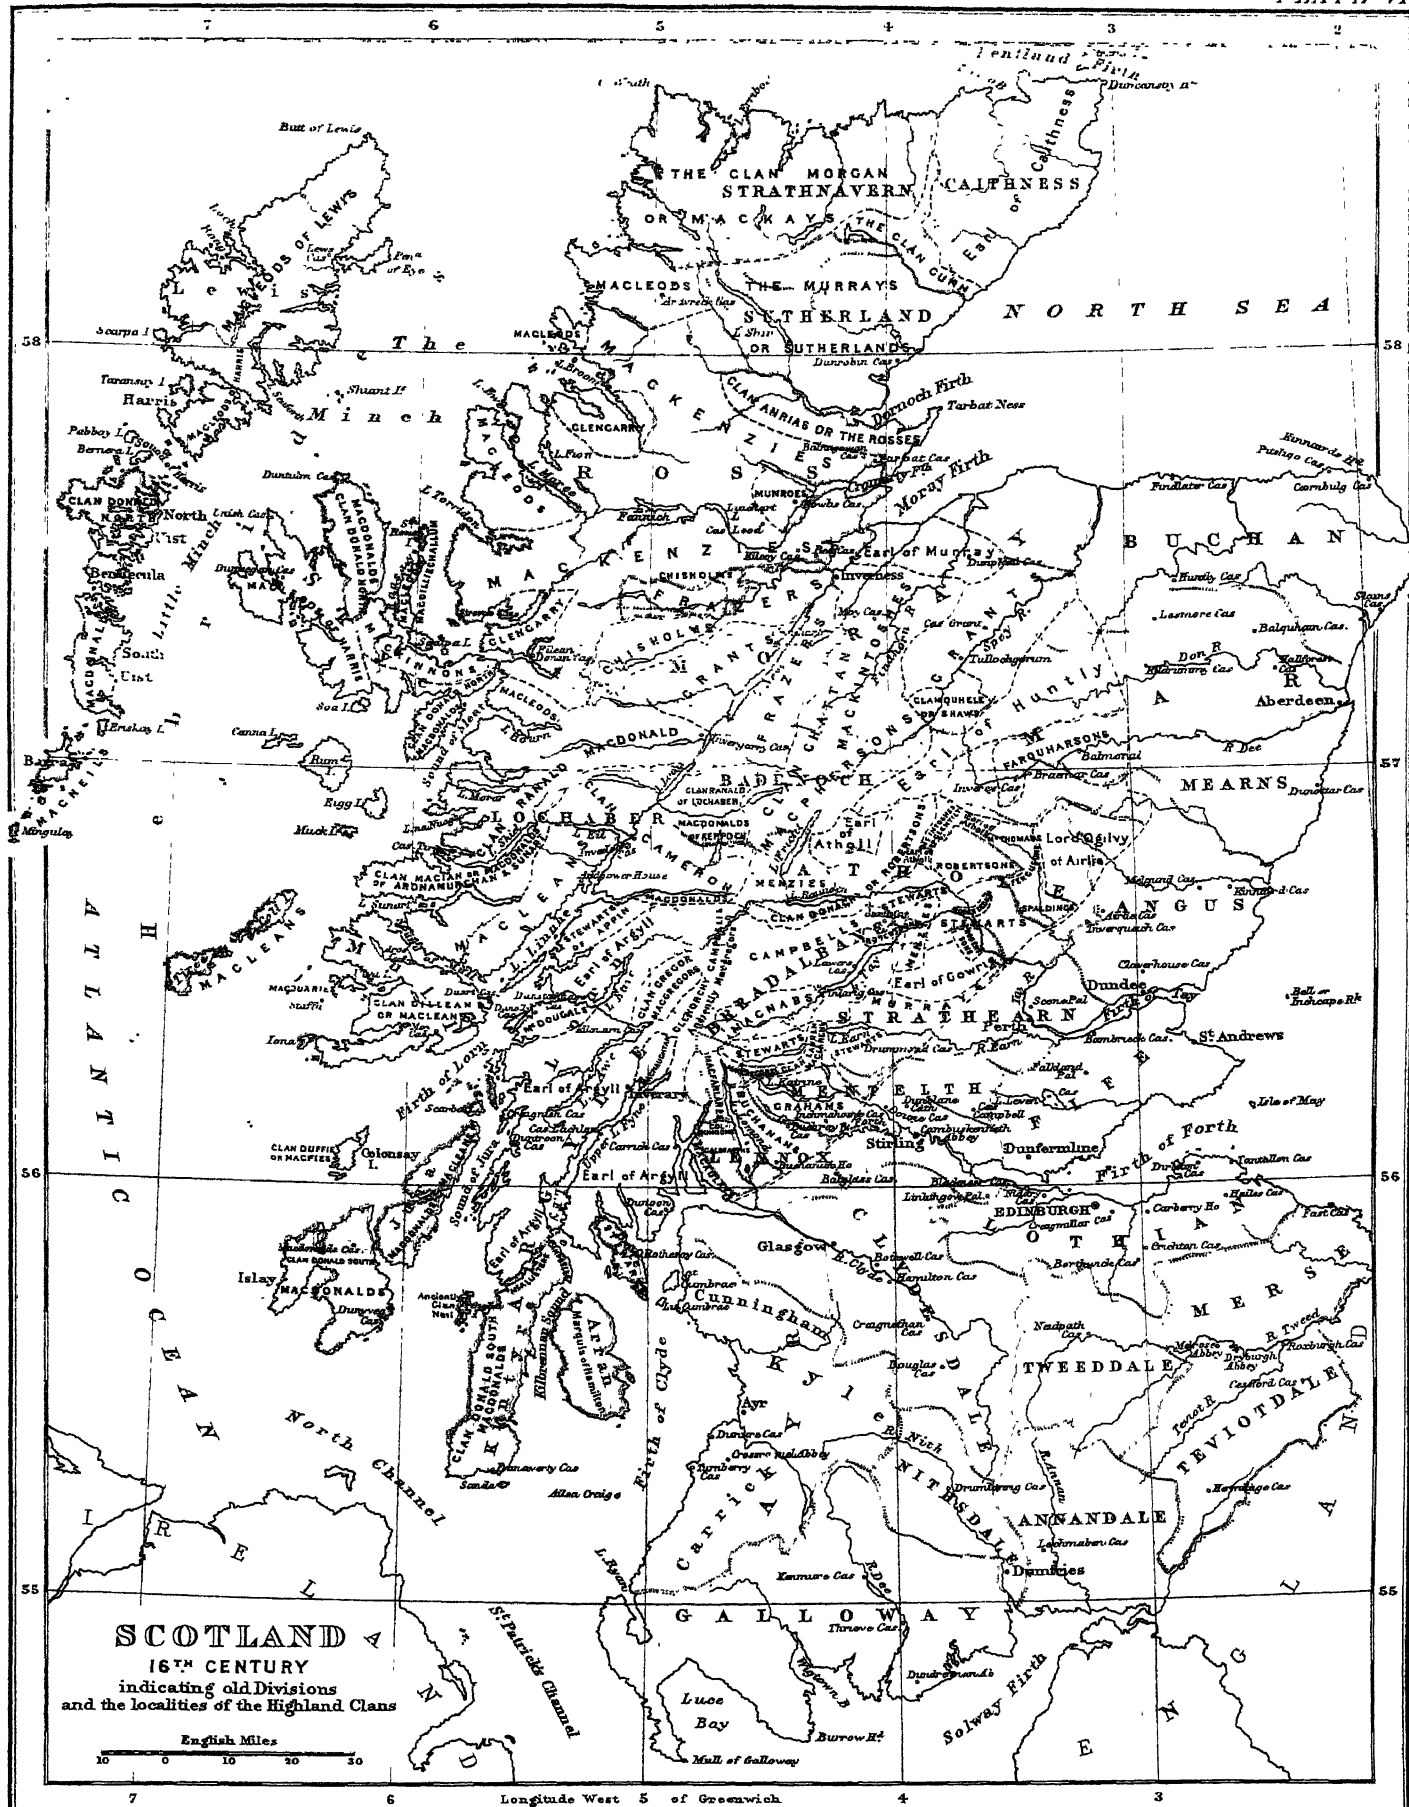

clamation forbade any Douglas to remain in the capital. A new ministry was appointed with Gavin Dunbar, now archbishop of Glasgow, who had been the king's tutor, as chancellor; Cameron, abbot of Holyrood, as treasurer; and the bishop of Dunkeld as privy seal. The Douglasses were attainted and their estates divided amongst the nobles of the opposite faction. A truce was made with England for five years. During the minority and duress of James the Scottish nobility became accustomed to bribes either from England or France. The French, to which the higher clergy belonged, were in the ascendant at the court of the young king, who naturally felt ill-will towards the Douglasses and leant on Albany, and after a time on Cardinal David Beaton, bishop of Mirepoix in France and nephew of the archbishop of St Andrews, whom he afterwards succeeded. Beaton was the Wolsey of Scotland; but James V. was not Henry VIII., and the ambition of the great prelate was baffled, not by the king, but by the nation. Three months before the king's escape Patrick HAMILTON (*q.v.*), abbot of Ferne, was burnt for heresy at St Andrews.

James, only seventeen when he gained his independence (1528), showed, like other Stuarts, activity in government, and the fourteen years of his actual rule, while not marked by outstanding events, were a period of renewed order and prosperity. He first turned to the borders, where constant wars with England had bred a race of lawless freebooters. By the severity of his measures he succeeded in doing what Angus and his predecessors had in vain tried to do. The borders continued till the union to trouble the ministers of the law; but the clans who lived by plunder and blackmail were first really broken by the expedition of James V. But it was not only borderers who required to be taught that a king was again on the throne: Argyll, who had sought to make himself independent, was deprived of his lieutenancy and imprisoned; Bothwell, the father of Mary's husband, was beheaded for the favour he showed the borderers; and the estates of the earl of Crawford were forfeited. James made a progress through the Highlands and was sumptuously entertained by the earl of Athole. While criminal justice was strictly enforced, a step was at last taken to organize a central civil court (15th May 1532), which had been a settled plan of the kings since James I. The College of Justice or Court of Session was founded in Edinburgh by the influence of Albany with the pope,—funds being got from the bishops' revenues for the payment of the judges. Of the fifteen judges eight, including the president, were to be clergy, and the barons were conciliated by the anomalous office of extraordinary lords.¹

The relations between James and Henry VIII. continued His hostile and there were mutual raids till peace was concluded marriage in 1534. Henry was then at the critical point of his divorce from Catherine of Aragon and anxious to secure an ally. France and Spain were also competing for the favour of the Scottish monarch, and Charles V. proposed a marriage with Mary of Portugal. But he had already indicated a preference for a French alliance, selecting Mary, daughter of the duc de Vendôme. The pope addressed James as defender of the faith, a title Henry VIII. had forfeited. The clergy by Beaton's advice granted him a large allowance out of their revenues. These inducements and the influence of Beaton and Dunbar, the two archbishops, kept James firm in his attachment to the old church, in spite of the temptation which Henry held out in its endowments and of the satires in which Sir David

¹ There were already signs of the small beginning of the profession of lay lawyers who were to play an important part in Scottish affairs in the 17th and 18th centuries. The establishment of a settled system of justice, independent alike of the baronial and ecclesiastical courts, was a much needed reform; but the latter still retained their consistorial jurisdiction.

Assump-
tion of
govern-
ment by
James V.

Lyndsay, his old tutor, and Buchanan, the tutor of one of his bastards, exposed its abuses. In 1537 he went to France to see his bride, but, falling in love with Madeleine, daughter of Francis I., obtained her hand instead. After an absence of nine months he returned; but the young queen died within a few weeks after landing. The following year he married Mary, dowager duchess of Longueville, daughter of Claude of Lorraine, duke of Guise. Next year (1539) Henry made another attempt to gain James through his envoy Sir Ralph Sadler, but, though the succession to the English crown in the event of Prince Edward's death was held out as a bait, James remained unmoved. In 1540 the king made a voyage round Scotland,—the first circumnavigation of his dominions by a Scottish sovereign. The Irish are said to have offered him their crown, and the barons of the north of England, whose sympathies were Catholic, were inclined to favour him. The position was perilous for Henry, many of whose subjects still remained Catholics at heart. He made a last attempt to induce James to meet him at York, but the Scottish king would not go so far across the border. Henry now ordered the marches to be put in a state of war, and Sir James Bowes, accompanied by Angus and Sir George Douglas, crossed the border, but was defeated in Teviotdale by Huntly and Home. The duke of Norfolk advanced with a large force, and, efforts to avert war having failed, James assembled the whole Scottish army and marched to Fala on the Lammermuirs, where he was reluctantly obliged to disband his force through the refusal of the nobles to go farther; they even thought of repeating the tragedy of Lauder, but could not agree as to the victims. James raised a smaller force and gave the command of it to Oliver Sinclair, whose promotion was ill received by the barons. Their discord allowed an easy victory to Dacre, who routed them as they were passing over Solway Moss (25th November 1542), taking Sinclair and several of the leaders prisoners. The news, brought to James at Caerlaverock, together with the disaffection of the nobles, broke his heart. A few weeks later at Falkland he heard of the birth of Mary Stuart, but the news brought him no comfort. His saying, "The crown came with a lass and will go with a lass," has passed into history, although the prophecy was not fulfilled. Outwardly his reign had been, with the exception of the closing scene, successful. He had restored order along the borders, and put down all attempts of the nobles against his person. He had maintained the church, supporting the bishops by severe laws against heresy. He had secured by his marriage the alliance of France and was on good terms with other Continental states. His powerful neighbour had not succeeded in wresting any land from Scotland. He was, like his father, a popular king, mingling with the people in their sports, and respected because of his strict administration of justice. But his foreboding was not without cause. The power of the nobles had only been restrained, not destroyed. The aristocracy had too many heads to be cut off by one or several blows. The principles of the Reformation were gradually spreading in spite of the attempts to stifle them, and the infant to whom he left the crown had to encounter rebellion at home and the hostility of England, not the less dangerous that she was heir to the English crown and its rulers veiled their hatred of her by professions of friendship. Knox describes James as "a blinded and most vicious king." Buchanan, who knew him better, is more fair, ascribing his faults to his time and bad education and doing justice to the qualities which made him loved by the people.

Mary Stuart.

Mary Stuart was deemed queen of Scotland from 14th December 1542 till 29th July 1567, when her son James VI. was crowned in her stead. This period of a quarter of a century is more crowded with events than any other part

of the Scottish annals, except the War of Independence, 1534-1545. It was the epoch of the Reformation, and it became a question of European as well as national importance which side Scotland would take. Closely connected with the religious question was the political, affecting the union of Scotland and England. The life of Mary, who united the personal charm of her race and its evil fortune, adds tragic interest to the national history. It falls into three parts,—from her birth to her return from France as the young widow of Francis II. in 1561; from her arrival in Scotland till her flight in 1568; and from her arrival in England till her execution in 1587; but only the second of these enters into the direct current of Scottish history. During the first Scotland was under the regency, first of Arran, then of Mary of Guise. It was rumoured that Cardinal Beaton forced James V. on his deathbed to sign a will naming him regent, or had forged such a document; but the principal nobles proclaimed the earl of Arran heir-presumptive to the crown, governor of the realm, and tutor to the queen, and this was confirmed by parliament in the following spring. Beaton was thrown into prison, but soon released. The death of James suggested to Henry a new scheme for the annexation of Scotland by the marriage of the infant heiress to his son Edward, and he released the nobles taken at Solway Moss on easy terms under an assurance that they would aid him. Angus and his brother George Douglas also returned to Scotland from their long exile on the same promise. Sir Ralph Sadler, one of the ablest English residents at the Scottish court—half envoys, half spies—was sent to conduct the negotiations. Arran was tempted to favour the marriage by the offer of the princess Elizabeth for his son and the government north of the Forth. But the queen dowager, though she pretended not to be averse to it, and Beaton did all they could to counteract Henry's project. One part of it, the immediate delivery of Mary and the principal castles to the English king, was specially objected to. A mutual alliance between the two kingdoms was agreed to on 1st July 1543, and Mary was to be sent to England when ten years old. Soon after a party of the nobles opposed to the match got possession of the young queen and removed her to Stirling. The English treaty was ratified by parliament; but Beaton and his partisans did not attend, and a few days later the regent, as Sadler expresses it, revolted to the cardinal. It was evident that the assured lords, though in English pay, were not to be relied on, and Henry resolved on war. His first act—the seizure of Scottish merchantmen in English ports—roused the patriotic feeling of Scotland. Before the close of the year the Scottish estates declared the treaty with England null and renewed the old league with France. Lord Lisle was sent with a fleet to the Firth of Forth, along with Hertford (afterwards the protector Somerset) as commander of the army, and Leith was sacked and Edinburgh burnt, though the castle held out. Lisle on his voyage home ravaged the ports of the Forth, while Hertford destroyed the towns and villages of the Lothians, aided by the English wardens, who made a raid across the border. Hertford returned the following year and destroyed the abbeys of Kelso, Jedburgh, Melrose, Dryburgh, Roxburgh, and Coldingham, besides many castles, market-towns, and villages. Such barbarous warfare renewed the memory of the War of Independence and the intense hatred of England, which had greatly abated. Lennox and Glencairn alone of the nobles sided with the English, and the Reformers saw with regret the nation driven to a French alliance as at least preferable to English conquest.

Beaton at this time really governed, imposing his will on the vacillating regent and sternly repressing heresy. George Wishart, the chief preacher of the Reformers, was seized, found guilty of eighteen articles of heresy, mostly

Regency of Arran.

War with Henry VIII.

Death of Wishart and Beaton.

1545-1558. taken from Calvin, and burnt at St Andrews. The war of religion, now openly declared, could not be carried on without bloodshed on both sides. Beaton was assassinated less than three months after Wishart's death in his own castle by Norman Leslie and other young men, some with private grievances, all desiring to avenge Wishart. The effect was adverse to the Reformers. Leslie and his associates, joined by a few others, of whom Knox was one, being shut in the castle, held it for a short time against the regent, but were forced to surrender to Strozzi, the French admiral.

Somer-
set's
raids.

The death of Henry VIII. (1547) did not put a stop to the war with England. The protector Somerset proved to be an implacable enemy, and, partly to strengthen his position as regent, determined to strike a more signal blow. Invading Scotland simultaneously with a large fleet and army, he defeated the Scottish regent at Pinkie (18th September 1547), took Edinburgh, and placed garrisons in several castles. Scotland had suffered no such reverse since Flodden. The progress of the capital was thrown back at least a century; scarcely a building remains prior to the date of his savage raids. Somerset was not in a position to follow up his advantage, for he had to return home to counteract intrigues. The young queen was sent from Dumbarton in the following summer (August 1548) to the court of France, where she was brought up with the children of Henry II. by Catherine de' Medici. Before she went a French force had been sent to Scotland, and in the camp at Haddington the estates had, by a majority led by the regent and queen dowager, agreed to Mary's betrothal to the dauphin. The regent was promised the dukedom of Chastelherault in return for his part in the treaty. For two years a fierce intermittent war continued between England and Scotland; but the former country was too much engaged in home affairs and the French war to send a large force, and the Scots recovered the places they had lost except Lauder. The issue of the French war was also adverse to the English, who were forced to agree to the treaty of Boulogne (24th March 1550), in which Scotland was included. In September the queen dowager went to France and obtained the transfer of the regency from Arran to herself. On her return, Arran not being prepared to relinquish his office, she proved herself a skilful diplomatist, gaining over the nobles by promises and the people by abstaining from persecution of the Reformers. A single execution—that of Adam Wallace, “a simple but very zealous man for the new doctrines”—took place in 1550 under the sanction of Archbishop Hamilton, natural brother of Arran, who had succeeded Beaton; but that prelate, whose natural disposition was towards compromise, authorized a *Catechism* in 1552 which minimized the distinctions in doctrine between the church and the Reformers, and was conspicuous for omitting all reference to the supremacy of the pope. At this time a large section of the clergy and people were still wavering, and the necessity of retaining them by moderation and reform was evident. The death of Edward VI. and the accession of Mary in 1553 had an important influence on the progress of the Scottish Reformation. The Scottish Reformers who had taken refuge in England had to escape persecution by returning home or going abroad, and the powerful preaching of Harlaw, Willock, and Knox, who came to Scotland towards the end of 1555, promoted the new doctrines.

Regency
of Mary
of Guise.

In the spring of 1554 the queen dowager at last succeeded in obtaining from the reluctant Arran a surrender of the regency. Mary had now attained her twelfth year and a nomination by her of her mother as tutor gave the form of law to what was really the act of the queen dowager, the French king, and the nobility. The people acquiesced,

for all classes were tired of a governor whose chief object was money. His actual investiture in the French dukedom removed any scruples in relinquishing a dangerous dignity. For the next six years the queen dowager was regent and conducted the government with such prudence that her real aims were only seen through by the most penetrating. Knox has been accused of a harsh opinion of her; but the upshot of her policy if successful would have been to subject Scotland to France and to that party in France so soon to be the relentless persecutors of the Reformers. She knew well how to bide her time, to yield when resistance was impolitic, to hide her real object, but this she pursued with great tenacity of purpose. A variety of circumstances favoured her,—the condition of England under Mary Tudor, the ill-will Arran had incurred, the absence of any leading noble who could attempt to seize the supreme power, the safety at the French court of her daughter, in whose name she governed, and the knowledge of her adopted country acquired by long residence. Yet her first step was a mistake so serious as to have well-nigh provoked revolution. In appointments to offices she showed such preference for her own countrymen as created intense jealousy on the part of the Scottish nobility, and would probably have led to open action but for the fact that many Scotsmen got offices and pensions from the French king. The new regent applied herself at once to the perennial work of every Scottish Government, the repression of disorder in the Highlands, and first Huntly, afterwards Argyll and Athole, were sent to Argyll and the Isles; but the presence of royalty was, as had before been found, the best remedy, and she made next year a circuit in person with more success than any of her lieutenants. Under the advice of her French counsellors she now garrisoned Dunbar with French soldiers and built a fort at Eyemouth (1556). She even ventured to propose to levy a tax for the maintenance of a standing army; but the remonstrance of 300 barons, headed by Sir John Sandilands, forced her to abandon a project so fatal in that age to liberty. Next year, at the instigation of the French king, she endeavoured to force the country into an English war. No time could have been worse chosen, for commissioners from England and Scotland had actually met at Carlisle to adjust differences between the two countries. The Scottish barons refused to fight, and from that date, Bishop Lesley notes, the queen regent could never agree with the nobility, and sundry of them sought by all means to raise sedition against her and the French.

In the parliament at the close of the year commis-Mary's sioners were appointed to go to France for the marriage marriage between Mary and the dauphin. Their instructions were to obtain a promise from both to observe the liberties and privileges of Scotland and its laws, and a ratification of the Act passed in 1548, when it was first proposed to send the young queen to France. The contract of marriage provided that their eldest son was to be king of France and Scotland and the eldest daughter (should there be no son) queen of Scotland, to be given in marriage by the joint consent of the king of France and the Scottish estates. In the event of her husband's death Mary was to be free to stay in France or return to Scotland. The marriage was solemnized at Notre Dame on 24th April 1558. But prior to the public contract a secret arrangement had been made, by which Mary, in three several deeds, made over the kingdom of Scotland to the king of France and his heirs if she died childless, assigned, to him possession of the kingdom until he was reimbursed in a million pieces of gold for her entertainment in France, and declared that, whatever documents she might afterwards sign by decree of parliament, this arrangement expressed her genuine intention. After the return of the commissioners the crown

matrimonial, with the title of king, was granted by parliament to the dauphin.

Progress
of Re-
forma-
tion.

While statesmen were occupied with the queen's marriage the Reformation had been steadily advancing. Knox laboured incessantly, preaching in Edinburgh ten days in succession and making rapid visits to the central and western shires. He attracted to his side representatives of the nobility and gentry, and had much support in the towns. The earl of Glencairn, Lord Lorne, Lord James Stuart, the future regent, and the laird of Dun, John Erskine, in Angus were amongst his earliest followers, as well as many of the tradesmen and artisans. Knox now openly denounced attendance at mass as idolatrous and began to administer the Lord's Supper after the manner of the Swiss Reformers. He was summoned to Edinburgh on a charge of heresy; but, though he kept the day, the proceedings were dropped. Shortly after he was again summoned, but meanwhile had accepted a call from Geneva. In his absence he was condemned for heresy and burned in effigy at the market cross of Edinburgh. Though absent, he continued the master-spirit of the Reformation in Scotland, and as the result of his exhortations Argyll, Glencairn, Morton, Lord Lorne, and Erskine of Dun drew up a bond (3d December 1557) to "defend the whole congregation of Christ and every member thereof . . . against Satan and all wicked power," themselves forsaking and renouncing "the congregation of Satan with all the superstition, abomination, and idolatry thereof." This was the first of many bonds or covenants in which, borrowing the old form of league amongst the Scottish nobility, the Lords of Congregation applied it to the purposes of the Reformation. They afterwards passed resolutions that prayers should be read weekly in all parishes by the curates publicly, with lessons from the Old and New Testaments, and that doctrine and the interpretation of the Scriptures should be used privately in quiet houses until God should move the prince to grant public preaching by faithful ministers. Argyll at once acted upon the resolutions and protected John Douglas, formerly a Dominican, his chaplain, who preached at Castle Campbell in spite of the remonstrance of Archbishop Hamilton. That prelate next took a fatal step. Walter Myln, parish priest of Lunan near Montrose, an old man of eighty-two, was burnt for heresy at St Andrews (8th April 1558). He was the last Protestant martyr in Scotland. The total number of deaths was small, it is believed twenty in all; but many people were banished or forced to leave the country and many fined, while none were allowed freedom of worship. Immediately after the death of Myln there began, says Knox, "a new fervencie amongst the whole people." Gathering courage from the popular feeling, the Lords of Congregation presented petitions in rapid succession to the regent. The first laid before her prayed "that it might be lawful to meet in public or in private for common prayer in the vulgar tongue, to interpret at such meetings hard places in Scripture, and to use that tongue in administering baptism and the Lord's Supper"; in reply permission was granted to preach in private and to administer the sacraments in the vulgar tongue. The second presented at the meeting of parliament prayed for a suspension of all Acts against heretics until a general council, that copies of the accusation and depositions should be given to all persons accused of heresy, that the accused should be allowed themselves to interpret any words charged as heretical, and should not be condemned unless found guilty of teaching contrary to Scripture. "The regent," Knox remarks, "spared not amiable looks and good words," but suffered the parliament to be dissolved (2d March 1557) without any answer. In the spring a synod met in Edinburgh and a third petition was laid before it,

praying that the canons should be enforced against clergy who led scandalous lives, that there should be preaching on every Lord's day and on holidays, that no priests should be ordained unless able to read the Catechism distinctly, that prayer should be in the vulgar tongue, that the mortuary dues and Easter offerings should be optional, and that the consistorial process should be reformed. Another point was included according to Lesley, —that bishops should be elected with the consent of the laity of the diocese and priests with that of their parishioners. The synod replied that they could not dispense with Latin in public prayer as appointed by the church, and that the canon law must be observed as to elections of bishops and priests. On other matters they were prepared to make concessions, and passed thirty-four canons in the spirit of the council of Trent directed to the due investigation and punishment of immorality of the clergy and the inspection of monasteries, better provision for preaching by bishops and priests, the remission of mortuary dues to the very poor, and the recognition of the sacrament of baptism as administered by the Reformers. A short exposition of the mass was to be published. These concessions proved the necessity for reform; but, as they were silent on the principal points of doctrine, as well as on the more radical reforms in church government, they could not be accepted. The time of compromise, if compromise had ever been practicable between Rome and Geneva, to which the Scottish Reformers adhered, was now past. Two events had occurred before the synod separated which hastened the crisis. On 17th November 1558 the death of Mary Tudor once more placed on the English throne a sovereign inclined to favour the Reformation. In May, during the sittings of the synod, Knox returned to Scotland and the Scottish Reformers once more had a determined leader.

The regent issued about Easter (1559) a proclamation forbidding any one to preach or administer the sacraments without authority of the bishops. Willock and other leading preachers having disregarded it were summoned to Stirling on 10th May. Their adherents assembled in great numbers, but mostly unarmed, at Perth, a town zealous for the Reformed opinions. Erskine of Dun went from there as a mediator to the regent at Stirling; she promised, but in vague terms, that she would take some better order with the ministers if their supporters did not advance. Notwithstanding they were outlawed for not appearing on the day of trial. Next day, when the news reached Perth, Knox preached his first public sermon (11th May) since his return, inveighing against "idolatry." Hardly had he ended when a priest began mass and opened the tabernacle on the high altar. A young man called out, "This is intolerable that, when God by His Word hath plainly damned idolatry, we shall stand and see it used." The priest struck the youth, who retaliated by throwing a stone, which broke an image. From this spark the fire kindled. The people destroyed the images in the church and then proceeded to sack the monasteries. The example of Perth was followed at many other places. The regent could not remain passive when the Congregation was sanctioning such action. But her position was one of grave difficulty. Her main support was from France, and, though she had adherents amongst the Scottish nobility, Argyll and Lord James, who were still with her at Stirling, were really committed to the Congregation. What course the new queen of England would take was still uncertain. On 11th May the regent advanced towards Perth, but the arrival of Glencairn with 2500 men from the west to aid the Congregation led to a compromise, of which the terms were these: both parties were to disband their troops; Perth was to be left open to the regent, but no French troops were to come within 3 miles; the inhabitants were

Struggle
between

gation
and Mary
of Guise.

1559-1560. not to be called upon to answer for their recent conduct; and all controversies were to be reserved for parliament. The Congregation, however, remained distrustful; Knox openly preached that the treaty would only be kept till the regent and her Frenchmen became the stronger, and before leaving Perth the Lords of Congregation entered into a new bond for mutual defence. The regent entered Perth the day they left (29th May), accompanied by the duke of Chastelherault and a bodyguard of French as well as Scottish troops paid by French money. The deposition of the provost in favour of a Papist and the occupation of the town by these troops were deemed breaches of the agreement, and Argyll and Lord James now joined the Reformers and took the lead in their proceedings. Their numbers increasing, the regent felt unable to retain Perth, and quitting it marched south, followed by the army of the Congregation, to which she abandoned Stirling, Linlithgow, and Edinburgh, taking refuge at Dunbar. The only conflict was at the Muir of Cupar, where a small force sent to save St Andrews was quickly dispersed by the superior numbers of its opponents. It was made a condition of a truce that no Frenchman should be left in Fife. The Reformers occupied Edinburgh for a few weeks, but were obliged to abandon it upon new terms of truce intended to preserve the *status quo*. Both parties were engaged in negotiations for active assistance, the one from France and the other from England. The regent had been daily expecting reinforcements, and a considerable number of troops about this time landed at Leith, which they began to fortify.

Negotiations of Reformers with England.

In the end of June Kirkaldy of Grange began a correspondence, afterwards continued by Knox, with Cecil, Percy, and Sir Herbert Croft. Their scheme was far-reaching. The young earl of Arran, though brought up in France, had become Protestant, and if he, the heir-presumptive to the Scottish crown, were married to Elizabeth the union of the two countries would be secured along with the Reformation. This would be a counter-stroke to the union of France and Scotland under a Catholic, which almost at the moment became for a brief time an accomplished fact, by the dauphin succeeding as Francis II. to the French crown on the death of his father. The policy of the Guises, who continued to control the Government under the new king, almost forced Elizabeth in this direction. Mary quartered the arms of England with those of Scotland, implying denial of Elizabeth's right both as illegitimate and as a heretic. But Elizabeth knew the value both of her hand and of the state, which, thanks to the ability of her ministers, was daily becoming more loyal. She had special cause for hesitating to ally herself with the Lords of Congregation. Knox had offended her by his vehement *Blasts against the Regiment of Women*, which, though primarily aimed against the Catholic queens, admitted no exception in favour of a Protestant. Nor could Knox even when supplicating aid adopt the courtier's language to which Elizabeth was accustomed. She was really afraid of the revolutionary principles of some of the Reformers, which seemed to threaten the throne as well as the altar. Moreover, Arran, who came secretly to the English court, did not please her, and there was an end of the matrimonial part of the scheme. The rest of it would probably also have miscarried but for the consummate statesmanship of Cecil, who saw where the interest of England lay. In August 1559 Sadler was sent with £3000 to the assistance of the Scottish Protestants. Another supply followed, but was intercepted, and in January 1560 a treaty was agreed to at Berwick between Elizabeth and the Lords of Congregation, to whom the duke of Chastelherault had now gone over. The Scots engaged not to enter into an alliance with France, and to defend the

country against French aggression. Elizabeth was to support Scotland by an army, but no place of strength was to be left in English hands. If any were taken from the French they were to be razed or retained by the Scots. The Scots were to assist England if attacked by France, and to give hostages for fulfilment of the treaty. Next spring an English army under Lord Grey crossed the Tweed (28th March 1560), met the forces of the Congregation at Prestonpans, and invested Leith, in which the French were also blockaded by sea. The regent had taken refuge in Edinburgh castle, and here on 10th June she died of dropsy. She had been deserted gradually by almost all her Scottish adherents. The last to go was Maitland of Lethington, the most talented but also the most cunning of the Scottish statesmen. His desertion was the sign of a lost cause. Even some of the higher clergy now conformed. Lord Erskine almost alone remained faithful. The regent's own courage never failed, and, though she received a visit from the leaders of the Congregation and consented to see Willock, she died a firm Catholic. Her misfortunes and her conciliatory policy during her long struggles to maintain the French connexion with Scotland have gained her a lenient judgment even from Protestants, all save Knox, whose personal animosity is palpable, though his view of her policy is correct.

Death of Mary of Guise.

Her death removed the chief obstacle to peace, which the English and the French courts had for some time desired, and the treaty of Edinburgh was concluded on 8th July 1560 upon terms favourable to Scotland. The military forces of both France and England were to evacuate Scotland, except a certain number of French, who were to remain in Inchkeith and Dunbar. Leith and Eyemouth were to be dismantled; Mary and Francis were to abstain from using the arms of England. By separate articles certain concessions were granted to the nobility and people of Scotland showing the length to which the limitation of the monarchy was carried. No French or other soldiers were to be brought into the realm unless in the event of an invasion and only with the consent of the estates. Neither peace nor war was to be made without their consent. A council of twelve (seven chosen by the king and queen and five by the estates out of twenty-four selected by the estates) were to govern the kingdom during the absence of Mary and Francis. The chief officers of the crown were to be natives. An Act of oblivion was to be passed for all Acts since 6th March 1558. Neither the nobles nor any other persons were to assemble in arms except in cases provided by the law. The duke of Chastelherault and his son, Arran, and all other Scots were to be restored to their French estates. With matters of religion the deputies refused to deal; but envoys were to be sent to the king and queen to lay before them the state of affairs, particularly those last mentioned.

Before parliament met an important step towards a new organization of the church was taken. Superintendents, some lay, others clerical, were appointed for Lothian, Glasgow, Fife, Angus, Mearns, Argyll, and the Isles. The principal ministers of the Congregation were planted in the chief towns,—Knox receiving Edinburgh as his charge. The convention parliament which assembled on 10th July and began its business on 1st August 1560 was the Reformation parliament of Scotland. Like Henry VIII.'s famous parliament, its work was thorough. It not merely reformed abuses but changed the national creed and accomplished more in one than the English parliament did in three sessions. The parliament was the most numerous yet held in Scotland, being attended not only by nearly all the nobility but by some bishops and an unusually large number of lesser barons or landed gentry, representatives of the burghs. Its statutes never received the royal assent,

Reformation parliament.

but were confirmed by the first parliament after Mary's deposition. On 18th August the Confession of Faith received the sanction of the estates. On the 24th an Act was passed declaring that the bishop of Rome had no jurisdiction or authority within the realm. Another rescinded all Acts passed since James I. contrary to God's word; and a third prohibited the mass or baptism according to the Roman rite, and ordained strict inquisition against all persons contravening the statute. The form of church government was not explicitly altered. The archbishop of St Andrews, and Dunkeld and Dunblane alone of the bishops, are said to have voted against the Confession, and Athole, Somerville, Caithness, and Bothwell alone of the nobles. The whole power of the state was at this time in the hands of the party of the Reformation and resistance was useless. The Confession of Faith, the cornerstone of the new policy both in church and state, was drawn up by Knox and five other ministers, but revised by the more moderate Reformers Lethington and Winram. The power of the civil magistrate was declared in terms which indicate the revision of Lethington rather than the original draft of Knox. Its language is certainly such as monarchs had been little accustomed to, though the expression is not so blunt as Knox used in preaching and conversation. Kings, princes, and magistrates in free cities are declared to be those to whom the reformation of religion "chiefly and most principally appertains." They are themselves to be judged by God, being appointed for the maintenance of the true religion and suppression of idolatry. Resistance to them, but only when vigilant in the execution of their office, is declared sinful.

The same persons who had prepared the Confession were entrusted with the composition of a code of ecclesiastical polity, and a draft, after being first laid before the convention of 1560, was submitted as revised to that of the following year. This *First Book of Discipline* was not universally approved; several of its provisions, especially those relating to church estates and their application to the support of the ministry, the relief of the poor, and the furtherance of education, were little to the taste of the nobility, and it was never sanctioned by the estates or fully acted on. Other parts of it were, however, embodied in the *Second Book of Discipline*, which became the law of the Reformed Church. It remains a memorial of the far-sighted views of Knox, its author; and the verdict of posterity has been in his favour and against the nobles who prevented its being carried out. See PRESBYTERIANISM, vol. xix. p. 679 sq.

The death of Francis II. (6th December 1560) materially altered the political situation. The much feared subordination of Scotland to France was at last averted. Mary Stuart, only nineteen, was young enough to be influenced by a new husband and new responsibilities. Her character was not yet known, but her relations with Catherine de' Medici were not friendly, and there was little doubt that she would take advantage of the provision in her marriage articles and return to Scotland. Sir John Sandilands's mission to France to procure the royal sanction to the treaty of Edinburgh and the Acts of the Reformation parliament must have been unpalatable, and he was not favourably received. Before she left France Mary was visited by envoys of the opposite parties into which Scotland was divided. Lesley, official of Aberdeen, afterwards bishop of Ross, and her valiant defender, was sent by the Catholic lords and bishops with a special message from Huntly, urging her to come to Aberdeen, where an army of 20,000 men would be at her disposal. But Huntly had not proved trustworthy during the regency and Mary rejected an offer which would have plunged the kingdom in war from the moment she landed. The very day after she had seen

Lesley her brother Lord James, who had been sent by 1560-1563. the Lords of Congregation, met her at St Dizier. She received him favourably, but declined to ratify the treaty till she consulted her council. An attempt was made to capture Mary on her way to Scotland; but, sailing from Calais on 14th August, she landed at Leith on the 19th. She was accompanied by three uncles and a considerable suite, including Castelnau the historian, Brantôme the memoir writer, and the poet Chastelard.¹

On her return to Scotland Mary showed herself disposed to conciliate the Reformers provided she was allowed the exercise of her own faith. This had been guaranteed her by Lord James. His near kinship to the queen at a time when the stain of bastardy was less regarded, and his close relation with the Reformers, made him necessary to both and gave him an influence which his eminent prudence used for the good of the nation, but with an eye to his own advantage. Without thrusting himself too prominently forward, he led the privy council (ably supported by Lethington), and, without the name, was in fact prime minister. The title of Mar, and, when that was reclaimed by the heir of the Erskines, of Moray or MURRAY (*q.v.*), with its large territories, gave him the designation by which he is best known, as well as great wealth, which he dispersed by means not well explained. But the leaven of another influence than that of the statesman was now at work in Scottish politics. This was embodied in John Knox, the most representative Scotsman since Wallace. The first Sunday after Mary's arrival the mob tried to interrupt mass at Holyrood, and Moray had himself to keep the chapel door to prevent its being broken. "His best excuse was," says Knox, "that he wald stop all Scotchmen to enter into the mass." Next Sunday Knox preached in Edinburgh against idolatry. "One mass was more fearful to him," he said, "than 20,000 armed enemies." Little likely as such sentiments were to please the young queen, a meeting between her and the preacher was arranged by Moray, the only third party present. On the matter of religion he was unbending, yet not more so than Mary. His judgment of the queen's character was, "If there be not in her a proud mind, a crafty spirit, and an indurate heart against God and His truth my judgment faileth me." In 1562 Huntly, the chief Romanist in the north, who offered to have the mass said in three counties, rebelled, being indignant at the grant to Moray of an earldom whose estates he then held. Mary, accompanied by her brother, made a progress in the north, where Huntly was defeated and slain at Corrichie, his elder son being imprisoned, his second beheaded, and the lands of Huntly, of his kinsman the earl of Sutherland, and other barons of the house of Huntly forfeited. On her return to Edinburgh Mary again met Knox at Holyrood. He rebuked her for dancing and other frivolities, advised her to attend the public sermons, and told her that it was not his duty to leave his studies in order to wait at her chamber door. There were other interviews, in one of which (April 1563) only Mary seemed to yield a little. She was anxious to use his influence to quiet a threatened rising in the west, and to heal a quarrel between her half sister the countess of Argyll and her husband. Knox promised his aid, but required in return that the penal laws should be enforced against the Papists. This Mary agreed to, and her promise was also apparently kept. Hamilton, archbishop of St Andrews, and forty-seven other persons were prosecuted for hearing confession

Mary's
return to
Scotland.

¹ The story of Mary Stuart, which now approaches by rapid steps its climax, has been told by Mr Swinburne (see MARY, vol. xv. p. 594 sq.), and a poet may regard human character in a manner different from the historian,—interpreting motives and drawing conclusions which history, whose view is limited by evidence, cannot reach. Here only the leading facts in her personal story can be stated so far as they affect the course of Scottish history.

1563-1567. and celebrating the mass. Yet Knox's comment in his *History* is, "This conference we have inserted to let the world see how Marie queen of Scotland can dissemble, and how that she could cause men to think that she bore no indignation for any controversy in religion, while that yet in her heart was nothing but venom and destruction, as short after that did appear." She was in fact corresponding with her uncle the cardinal of Lorraine, with the pope, with Philip II., testifying her steadfast attachment to Papacy and her desire to restore the Catholic faith. At a last conference Knox remonstrated against her marriage, then thought imminent, with a Papist, claiming the right of a subject "to speak out on this topic which so nearly concerned the commonwealth," remaining unmoved by the last argument of a woman, which he savagely describes as "howling and tears in greater abundance than the matter required." Nothing but perusal of the conversations can bring before us this pregnant passage of history—the abasement of the Scottish monarchy before the religious democracy—of the woman forced to dissemble and weep before the stern man believing he delivered a message from God to the head of a corrupt court. Something was allowed to Knox's sincere outspokenness. He moved men and women alike by words which, like Luther's, go straight to the realities of life. He is the typical Scottish divine framed on the model of the Hebrew prophets, and often reproduced in weaker copies. The Reformation in Scotland, in both its strength and its weakness, was his work more than that of any other man. The Presbyterian form of government, of which his friend Calvin was the author, was introduced by Knox from Geneva and continued for long to enforce discipline, first by censure and then, if need be, by excommunication and temporal punishment, entirely in his spirit.

Mary's
marriage
to Darn-
ley.

Not only to Knox and the Reformers but to all classes the question of the day was the queen's marriage. Apart from her beauty, her political position rendered her hand of importance to the balance of power. It held not only the dowry of France and the possession of Scotland but a claim, which might be at any moment asserted, to the English crown. She avowed her inclination to marry, and indeed she required a man to put her in possession of her kingdom. Don Carlos, the archduke of Austria, son of Philip of Spain, Charles IX. of France, the kings of Denmark and of Sweden, the archduke Charles, second son of the emperor, were all passed in review but rejected. Elizabeth pressed the claim of her favourite Leicester,—a project supported by Cecil and Moray. In the end the fair face and fine figure of her young cousin Henry Stuart, Lord Darnley, carried the day. A party of the Scottish nobles—Athole, himself a Stuart, Morton, Crawford, Eglinton, and Cassilis—favoured the alliance. David Rizzio, the queen's foreign secretary, who already had great influence with her, promoted it. But it was her own act, the most dangerous of many false steps in her life. Shortly before the marriage (29th July 1565) Moray attempted to seize Darnley and the queen as they rode from Perth to Callendar near Falkirk. When it was accomplished he rose in arms with the duke of Chastelherault, the head of the Hamiltons, Argyll, and Rothes; but Mary with a large force pursued them from place to place in the Roundabout Raid, from the neighbourhood of Edinburgh through Fife, where she levied fines, and finally to Dumfries, from which Moray fled to England. He had been secretly but not vigorously supported by Elizabeth, who, when she heard of his flight, recalled her orders to Bedford, then on the marches, to place troops at the disposal of the insurgents. Mary still retained some of the popularity of a young queen, and fostered it by an apparent desire to humour the Reformers. For the first time she attended a Protestant

sermon. But the consequences of a union between a high-spirited woman, active in mind and body beyond her sex and years, with a vain and dissolute youth were soon seen. His alienation from the queen, the murder of Rizzio, with the intrigues that preceded and followed it, the rapid growth of Bothwell's influence, the pitiable vacillations of Darnley, and his murder at Kirk of Field (10th February 1567) have been sketched in the article MARY (vol. xv. of *Murder of Darnley*, p. 596 sq.). The authors of the last crime were Bothwell, who devised it, and his servants, who executed it. Their confessions leave no doubt of their own guilt. Who were their accomplices has from that day to this been debated without conclusive answer. The great controversy is whether the nobles with Moray at their head had bound themselves to support Bothwell, as he and Mary afterwards declared, or whether Mary, possessed with passion for Bothwell and hate of Darnley, herself instigated her husband's murder. Some have thought both the queen and the nobles were implicated. The casket letters, alleged to have been found in a coffer that was given to Morton by Dalgleish when intrusted with it by Sir James Balfour for its delivery to Bothwell, must be left out in any fair examination of this question. The mode of their recovery and their production, first partially and secretly before Elizabeth's commissioners at York, then with apparent but not real publicity at Westminster (for Mary's counsellors were not allowed to see them), their contents, so different from her known writings, and the disappearance of the originals render their evidence inadmissible. What weighs most against Mary is her subsequent conduct, explicable only in favour of innocence if she was absolutely in Bothwell's power from the time of the murder to the defeat of Carberry,—an hypothesis not borne out by facts. Though Lennox and his wife urged that the murderers be brought to justice, there was delay till 13th April, when Bothwell was at last brought before an assize. The trial was a sham, and his acquittal on the pretence that there was no accuser could deceive no one.

The strange wooing which commenced when Darnley was just buried, if not before, was continued by the seizure of Mary by Bothwell near Cramond and her captivity in her own castle of Dunbar—a pretence according to her adversaries, an opportunity for an outrage from which marriage was the only escape according to her defenders—at last culminated in the marriage at six in the morning, at Holyrood, on the 15th of May 1567. It was the month when wicked women marry, said the people, writing Ovid's line on the Tolbooth walls. Before it took place she created Bothwell duke of Orkney, and pardoned him for any violence. She also wrote in palliation of his conduct to the French king. His divorce from Lady Jane Gordon had been hurried through both the bishops' court and that of the Protestant commissaries,—in the former on the false pretence that there had been no papal dispensation for his marriage to one of near kin, and in the latter on the ground of adultery. Mary had been more than once warned of the consequences of such a marriage by Lord Herries, by the faithful Melville, and by Craig, the minister who, with the utmost reluctance, proclaimed the banns. It was an act which required no warning. She had no alternative, urge her vindicators, to save her honour, and her tears on the morning of marriage are proof that she was forced; but the more scrupulous admit she should have preferred death to union with a man she must at least have known was not clear of Darnley's murder. Her enemies said then, and historians who take their side repeat, that it was the madness of a passion she could not resist. The view most consistent with the facts seems to be that she accepted, not without fits of remorse, the service of the strongest sword at her disposal on the only terms on which she

could obtain it. But, if Mary cannot be acquitted of the degree of complicity implied in accepting the consequences of the murder, many of the leading nobles were involved in equal guilt. On 19th April a bond asserting Bothwell's innocence and urging Mary to marry him had been signed at Ainslie's tavern, not only by Bothwell's few friends, but by "a great part of the lords." Most of those who signed had in the parliament just concluded received grants of land or remission of forfeiture, and it is urged by Mary's defenders that they were bribed to acquiesce in Bothwell's designs. When the bond was afterwards put in evidence against them their plea was that they had been forced to sign it by Bothwell. It is contended on Mary's behalf that with so many of the nobles committed to approval of the marriage she had no one on whom to rely. There is something in this argument; but it does not meet the point—Why did she rely on Bothwell? That a scheme was arranged before Darnley's murder to entrap her into this marriage, in order to pave the way for her deposition, and that the casket letters were fabricated to clench her guilt, has been suggested; but the facts necessary to prove so deep a train of conspiracy are wanting. The two Scotsmen who almost alone maintained the character of honest men, Kirkaldy of Grange and Sir James Melville, who were so far from being unfriendly to Mary that they ultimately espoused her cause, believed that she was a willing victim and threw herself into Bothwell's arms. The narrative in her own despatch to the bishop of Dunblane does not allege that she was forced, but only that "he partlie extorted and partlie obtained our promise to take him as our husband."

Mary a
prisoner.

The leading nobles were not disposed to accept a new master in Bothwell, whose vices, unlike those of Darnley, were coupled with a strong instead of a weak character. They kept jealous possession of the young prince, placed in the custody of Mar in Stirling; and, when a muster was called to enforce order on the border, secretly collected their forces to act against instead of for the queen and her husband. Within a month of her marriage she was met at Carberry Hill, near Musselburgh (15th June 1567), by a force of the confederate lords, headed by Morton and Glencairn, Ruthven and Lindsay. Mary, after a fruitless attempt at mediation by Du Croc, the French ambassador, and an offer equally vain by Bothwell to decide the issue by single combat, surrendered to Kirkaldy. Bothwell rode off to Dunbar with a few followers, and Mary was conducted to Morton's camp. Once in their hands, the lords treated her as a prisoner, and confined her at Lochleven Castle, where she was forced to abdicate, surrendering the crown in favour of her son and committing the regency during the minority to Moray. The young king was crowned at Stirling on 29th July. The prudent Moray, who had kept out of the way in France while these events were transacted in Scotland, now returned and was installed as regent (22d August). Mary remained prisoner in Loch Leven for nearly a year. After her escape on 2d May 1568 the duke of Chastelherault and other Catholic nobles rallied round her standard; but on 13th May Moray and the Protestant lords met her forces at Langside near Glasgow, and the issue of that battle forced her to fly to England, where she placed herself (19th May) in the hands of Lord Lowther, governor of Carlisle, recalling Elizabeth's promises of protection. Mary, however, found that she was really a prisoner. Like Baliol, she disappears personally from the field of Scottish history; but her life in exile, unlike his, was spent in busy plots to recover her lost throne. It became clear as time went on that she placed her whole reliance on the Catholic minority and foreign aid; even in prison she was a menace to Elizabeth and ready to plot against her as an enemy. The Pro-

testant party increased in Scotland until it became a 1567-1569. majority almost representative of the whole nation; even her own son when he came to hold the sceptre, little inclined as he was to accept Presbyterian principles, regarded her as a revolutionary element fortunately removed. Her knowledge of Babington's plot for the invasion of England is proved, though her assent to the death of Elizabeth is still an open question. By her will, confirmed by her last letters, she bequeathed the crown of Scotland and her claim to that of England to Philip II. The letters contain this modification only, that her son was to have an opportunity of embracing the Catholic faith under the guardianship of Philip to save his own throne. There was no such reservation as regards that of England. The Armada, from whose overthrow date the fall of Spain and the rise of Britain as the chief European power, was due to the direct instigation of Mary Stuart.

Meantime, in Scotland, four regencies rapidly succeeded each other during the minority of James. The deaths by violence of two regents, Moray and Lennox, the suspicion of foul play in the death of the third, Mar, and the end scarcely less violent because preceded by a trial of the fourth, Morton, mark a revolutionary period and the impossibility of the attempted solution by placing the government in the hands of the most powerful noble. Hereditary royalty, not the rule of the aristocracy, was still dominant in Scottish politics and a regency was an experiment already disparaged in the preceding reigns. Moray, said Sir J. Melville, "was and is called the good Moray's regent," mingling with this praise only the slight qualification that in his later years he was apt to be led by flatterers, but testifying to his willingness to listen to Melville's own counsels. This epithet bestowed by the Protestants, whose champion he was, still adheres to him; but only partisans can justify its use. He displayed great promptness in baffling the schemes of Mary and her party, suppressed with vigour the border thieves, and ruled with a firm hand, resisting the temptation to place the crown on his own head. His name is absent from many plots of the time. He observed the forms of personal piety, possibly shared the zeal of the Reformers, while he moderated their bigotry. But the reverse side of his character is proved by his conduct. He reaped the fruits of the conspiracies which led to Rizzio's and Darnley's murders. He amassed too great a fortune from the estates of the church to be deemed a pure reformer of its abuses. He pursued his sister with a calculated animosity which would not have spared her life had this been necessary to his end or been favoured by Elizabeth. The mode of production of the casket letters and the false charges added by Buchanan, "the pen" of Moray, deprive Moray of any reasonable claim to have been an honest accuser, zealous only to detect guilt and to benefit his country. The reluctance to charge Mary with complicity in the murder of Darnley was feigned, and his object was gained when he was allowed to table the accusation without being forced to prove it. Mary remained a captive under suspicion of the gravest guilt, while Moray returned to Scotland to rule in her stead, supported by nobles who had taken part in the steps which ended in Bothwell's deed. Moray left London His on 12th January 1569. During the year between his regency. return and his death several events occurred for which he has been censured, but which were necessary for his security,—the betrayal of the duke of Norfolk and of the secret plot for the liberation of Mary to Elizabeth, the imprisonment in Loch Leven of the earl of Northumberland, who after the failure of his rising in the north of England had taken refuge in Scotland, and the charge brought against Maitland of Lethington of complicity in Darnley's murder. Lethington was committed to custody, but rescued by

1569-1575. Kirkaldy of Grange, who held the castle of Edinburgh, and while there "the chameleon," as Buchanan named Maitland in his famous invective, contrary to the nature of that animal, gained over those in the castle, including Kirkaldy. Moray was afraid to proceed with the charge on the day of trial, and Kirkaldy and Maitland became partisans of the queen. The castle was the stronghold of the queen's party,—being isolated from the town and able to hold out against the regent who governed in the name of her son. This defection was mourned over by the Reformers. Knox, with the self-confidence which marked his character, sent from his deathbed to Kirkaldy a message of warning that "neither the craggy rock in which he confided, nor the carnal wisdom of the man [Maitland] whom he esteemed a demi-god, nor the assistance of strangers, should preserve him from being disgracefully dragged to ignominious punishment." It has been suspected that Maitland and Kirkaldy were cognizant of the design of Hamilton of Bothwellhaugh to murder Moray, for he had been with them in the castle. This has been ascribed to private vengeance for the ill-treatment of his wife; but the feud of the Hamiltons with the regent is the most reasonable explanation. As he rode through Linlithgow Moray was shot (23d January 1570) from a window by Hamilton, who had made careful preparation for the murder and his own escape. Moray was buried in the south aisle of St Giles Cathedral, Edinburgh, amid general mourning. Knox preached the sermon and Buchanan furnished the epitaph, both unstinted panegyrics. His real character is as difficult to penetrate as that of Mary. It is easy for the historian to condemn the one and praise the other according to his own religious or political creed. It is nearer truth to recognize in both the graces and talents of the Stuart race, which won devoted followers, but to acknowledge that times in which Christian divines approved of the murder of their enemies were not likely to produce a stainless heroine or faultless hero, indeed necessitated a participation in deeds which would be crimes unless they can be palliated as acts of civil war. Let us absolve, if we can, Moray and Mary of Darnley's blood. It remains indisputable that Mary approved of Moray's assassination and that Moray would have sanctioned Mary's death.

Regen-
cies of
Lennox
and Mar.

Moray was succeeded in the regency by Lennox, Darnley's father, the male nearest of kin to the future sovereign, but really the nominee of Elizabeth. His brief term of office was marked by the renewal of the English war under Sussex and other generals, which made the queen's cause again the more popular. Lennox, another victim of violence, was slain (3d September 1571) in a hasty attack by one of the Hamiltons on Stirling, from which Morton, the real head of the Protestant party, who at first had been taken and threatened with the same fate, barely escaped. Mar, who had all along held the custody of the young king, was now chosen regent and held the post for a year, when he died (28th October 1572). During his regency the civil war between the queen's and the king's party continued. An English intrigue was carried on with great mystery, and never brought to a point, by Randolph and Killigrew to deliver Mary to the regent that she might be tried within her own dominions. On the death of Mar, Morton, who had been the most powerful noble during the last regency, at length reached the object of his ambition by being elected regent. On the day of Morton's election Knox died. He was "one," said Morton, "who never feared the face of man." If we condemn his violent language and bitter spirit, it is just to remember that he lived during the red heat of the struggle between Rome and the Reformation, and died before the triumph of the latter in Scotland was secure. He had felt the thongs of

Knox's
work.

the galleys and narrowly escaped the stake. The massacre of St Bartholomew spread consternation throughout Protestant Europe just before his last illness. Mary and Philip of Spain were still plotting for the destruction of all he held vital. His scheme for the reformation of the church and application of its revenues was in advance not of his own time only. He contemplated free education for children of the poor who really required such aid,—a graduated system of parish schools, burgh schools, and universities, which would have forestalled the most recent educational reform. While he introduced Presbyterian government by kirk-sessions, presbyteries, synods, and general assembly and opposed even a modified Episcopacy, he saw the advantage of the superintendence of districts by the more learned and able clergy. While he insisted on the preaching of the word and the administration of the sacraments in the vulgar tongue, his liturgy shows his favour for forms of public prayer. Knox's first wife was English, and two of his sons took orders in the Church of England. Scottish Presbyterianism had not yet been hardened by persecution into a hatred of prelacy as bitter as that of Popery. It meant separation from Rome, but inclined to union with England, and the question of the form of church government was still open.

Morton, like his predecessor, favoured the Episcopal Regency order, and, acting upon a compromise agreed to at Leith, of a modified Episcopacy was restored. The bishops appointed Morton. were declared subject to the king in temporal and to the church and general assembly in spiritual matters, and were to have the same jurisdiction as the superintendents. The assembly of Perth protested against the use of certain ecclesiastical titles, but passed over that of bishop. Most of the clergy sanctioned, though with reluctance, the appointment of bishops in the hope of retaining their revenues. The people called them "tulchan" bishops, from the straw counterfeits used to rob the calf of its mother's milk. Almost the whole church property remained in the hands of the landed proprietors, Moray in the first instance and afterwards Morton receiving a lion's share. Avarice was Morton's besetting sin. In other respects he was an energetic and capable ruler. He effected at Perth, with the aid of Elizabeth's envoy, a pacification with Huntly, Chastellerauld, and the Catholic nobles who supported Mary. Only the castle of Edinburgh held out, and this, aided by English artillery, he succeeded in taking after a brave resistance by Kirkaldy and Lethington. Kirkaldy and his brother were executed at the cross of Edinburgh. Lethington escaped their fate in what Melville calls "the Roman manner,"—at his own hands, perhaps by poison. The death of the bravest and the ablest Scotsman of that age put an end to the last chance of Mary's restoration by native support. Morton, now without a rival, restored order in the borders, and when an encounter occurred between the English and Scottish borderers called the Raid of the Redswyre his prudence prevented it becoming a national conflict. He appointed a commission for the reform of the law,—a far-sighted scheme, often attempted but always stopping short of success, to codify the law, which several Continental states, notably Denmark, about this period engaged in. The time was not ripe for a change which, now that it is, remains unaccomplished. But, while all seemed to favour Morton, there were undercurrents which combined to procure his fall. The Presbyterian clergy were alienated by his leaning to Episcopacy, and all parties in the divided church by his seizure of its estates. Andrew Melville, who had succeeded to the leadership of Knox, was more decided than Knox against any departure from the Presbyterian model, and refused to be won by a place in his household. His expensive buildings at Dalkeith, which got the name of

the Lion's Den, roused the jealousy of the nobles. The arrogance of his favourites exceeded his own. The commons were disgusted by a depreciation of the coinage. The powerful earl of Argyll, incensed by the recovery from his wife, the widow of Moray, of some of the crown jewels, and Athole, a Stuart and Roman Catholic, united with Alexander Erskine, governor of Stirling, who now had the custody of the young king, in a league which received so much support that Morton bent before the storm and offered to resign. The king, whose education had been forced by Buchanan, now barely twelve years of age, nominally assumed the government, but was directed by a council of nobles headed by Athole as chancellor. Morton surrendered the castle of Edinburgh, the palace of Holyrood, and the royal treasures, retiring to Loch Leven, where he busied himself in laying out gardens. But his ambition could not deny itself another stroke for power. Aided by the young earl of Mar, he got possession of Stirling castle and the person of the king. Civil war was avoided only by the influence of Bowes, the English ambassador. A nominal reconciliation was effected, and a parliament at Stirling introduced a new government. Morton, who secured an indemnity, was president of the council, but Athole remained a privy councillor in an enlarged council with representatives of both parties. Shortly afterwards Athole died, of poison it was said, and suspicion pointed to Morton. His return to power was brief, and the only important event was the prosecution of the two Hamiltons, the abbots of Arbroath and Paisley, who still supported Mary and saved their lives by flight to England. The struggle with the Presbyterian clergy continued. The *Second Book of Discipline* had been presented to the king before he assumed office, and, although the general assembly in 1580 condemned Episcopacy absolutely, parliament did not sanction the condemnation. The final fall of Morton came from an opposite quarter. In September 1579 Esmé Stuart, Lord D'Aubigny, the king's cousin, came to Scotland from France, gained the favour of James by his courtly manners, and received the lands and earldom of Lennox, the custody of Dumbarton castle, and the office of chamberlain. One of his dependants, Captain James Stuart, son of Lord Ochiltree and brother-in-law of Knox, had the daring to accuse Morton at a meeting of the council in Holyrood of complicity in the murder of Darnley, and he was at once committed to custody. Some months later Morton was condemned by an assize for having taken part in that crime, and the verdict was justified by his confession that Bothwell had revealed to him the design, although he denied participation in its execution. He was executed by the Maiden—a guillotine he had himself brought from England—on 2d June 1581.

Lennox
and
James
Stuart
regents.

From December 1580 to August 1582 the government was in the hands of Lennox and Stuart, now captain of the guard,—a small force which the estates had reluctantly allowed the king to protect his person. Their jealousy threatened but never reached an open rupture. Stuart was rewarded by the gift first of the tutory, then of the earldom of Arran in April 1581. Lennox was created duke, a title seldom granted in Scotland. Their aim, carefully concealed by nominal adherence to the Protestant faith, appears to have been the association of Mary with her son in the government, a breach with England, the renewal of the league with France, and the restoration of the Roman Church. The nobles, bribed by office or the spoils of the church, were men of too feeble character to resist, but the Presbyterian ministers were made of stronger metal. Illegal banishment of the contumacious clergy and arbitrary orders of council were followed by a rising against Episcopacy. The proclamation of an extraordinary chamberlain air—an itinerant court of justice—to be held by Lennox

at Edinburgh on 27th August precipitated the *coup d'état* of 1575-1585. the Raid of Ruthven, which took the usual form of Scottish revolutions,—the seizure of the king and the transfer of power to his captors. When on a visit (22d August 1582) to the earl of Gowrie, son of his mother's foe Lord Ruthven, at his castle of Hunting Tower near Perth, the earl his host, Mar, the master of Glamis, and others, taking advantage of the absence of Lennox and Arran, surrounded the castle with armed men and made James a prisoner, though still ostensibly treating him as king. Arran, returning to Perth with only two followers, was seized and put in prison. Lennox, after taking refuge in the castle of Dumbarton, fled to France, where he died in disgrace with the Catholics, because he had conformed to the Protestant doctrine.

The government was for ten months in the hands of a new council, of which Gowrie as treasurer was the head. There was no parliament, but a convention at Holyrood ratified the consequences of the Raid of Ruthven. A declaration was extorted from the king condoning his capture; but James, no longer a boy, chafed under the tutelage of the Protestant nobles and the admonitions of the Protestant ministers. In June of the following year he escaped from Falkland to St Andrews, which was held by Colonel Stewart. Arran was recalled, the Raid of Ruthven declared treason, Gowrie executed, and the chief Protestant lords banished. Melville and other ministers found it necessary to fly to England. A parliament confirmed the supremacy of Arran, who was created chancellor, and the forfeiture of the chief persons implicated in the Ruthven Raid. The king's power was declared to extend over all estates and subjects within the realm; all jurisdictions not approved by parliament and all assemblies and conventions without the king's licence were discharged. A commission was granted to Patrick Adamson, archbishop of St Andrews, and other bishops for trying ecclesiastical causes, and a form of judgment was established for depriving ministers of their benefices for worthy causes. A declaration was required to be subscribed by all beneficed men—ministers, readers, masters of colleges and schools—acknowledging their submission to the king and obedience to their ordinary bishop or superintendent appointed by him, under pain of forfeiture. A few subscribed unconditionally, others with the qualification, "according to the Word of God"; but a large number declined, and suffered the penalty. Early in 1585 Adamson issued a paper declaring the king's supremacy in matters ecclesiastical, defending the restoration of bishops, and announcing the king's intention that the bishops should hold synods twice a year, that general assemblies should be allowed provided they had his sanction, but that no jurisdiction was to be exercised by presbyteries. This document, which cut at the root of the Presbyterian system and was a formal declaration in favour of the royal supremacy and Episcopacy, was met with vehement protests by Melville and the exiled ministers.

Meantime a series of intrigues went on between the James English and Scottish courts. Elizabeth, while ostensibly favouring the exiles, disliked their political principles. James and Arran, instead of leaning on the papacy as Mary did, had shown signs of accepting a solution of the problem of church government more like that of England than of Geneva. There was here ground for a compromise of the religious controversy which political reasons made so desirable. Accordingly Lord Hunsdon, a favourite courtier of Elizabeth, met Arran near Berwick in the autumn, when it was arranged that the master of Gray, then a follower of Arran and personal favourite of James, should go to London in October. At his instance Elizabeth removed the banished Scottish lords and ministers from Newcastle to London. But Gray was playing his own

beth.

1585-1595. game, and his suggestions that these lords might return to Scotland, and that the alliance with England should be carried out by their aid and his own influence independently of Arran, were taken up by the queen, who had no personal liking for Arran, and ultimately effected. Elizabeth sent Wotton to Scotland, who won the confidence of James, to whom he promised a pension of £5000 a year, and while openly negotiating with Arran secretly plotted with Gray for his downfall. A mutual league between England and Scotland against the Catholics, called "the Bond anent the True Religion," was agreed to by a convention of estates in July 1585.

This was a turning-point in the life of James and in the history of Scotland. The choice was made between France and England, Romanism and Protestantism. It was not likely to be reversed when with Elizabeth's declining years the crown of England was thrown into the balance. The day before the conclusion of the treaty Arran was at the request of Elizabeth's envoy put in strict ward, under the pretext that he had been privy to the death of Lord Russell, son of the earl of Bedford, in a border fray, and he only escaped at the price of his estates and honours. In November the banished lords—Angus, Mar, the master of Glamis—returned, and along with them the two Hamiltons; and, aided by Gray, they seized the person of the king and the castle of Stirling, and assumed the government. The alliance with England was finally ratified at Berwick by Randolph. James, at the instigation of Gray, wrote a harsh letter to his mother; and at the instance of Elizabeth he allowed George Douglas, who had been concerned in Darnley's murder, to return to Scotland. The exiled Protestant ministers were restored to their livings; but James was resolute in maintaining Episcopacy and enforcing the laws against all who denied the royal supremacy. Adamson was indeed forced by a general assembly to disclaim any authority as archbishop not allowed by God's Word, and an Act was passed again dividing Scotland into presbyteries, but the king refused to subject the bishops to their jurisdiction. Mary, deserted by her son, now allowed herself through her immediate confidants, especially her secretaries Nau and Curle, to take an active though secret part in the Jesuit plots which embraced both Scotland and England in their ramifications. That which had for its aim the assassination of Elizabeth was discovered by Walsingham's spies, and, though forgery was resorted to, it is difficult to doubt that Mary was cognizant of the design. The trial at Fotheringay could have but one result under a statute according to which any attempt against the queen's life was treason in the person for whom it was made as well as in the actual perpetrators. The execution (8th February 1587) of Mary naturally roused the anger of the Catholic powers and some indignation in Scotland, which James professed to share; yet he did nothing but expostulate. In truth his own crown was threatened by the same enemies. Mary had disinherited him in favour of Philip of Spain, unless he adopted the Catholic faith. The defeat of the Spanish Armada by the sovereign and people of both countries was felt to be a providential deliverance. Nothing could have served better to efface the memory of Mary and extinguish pity for her fate.

Majority of James. The fall of Gray, who was tried and condemned for treachery during his English embassy and for correspondence with Catholic princes, left James, now of full age, without what was almost a necessity to his weak nature,—a favourite, though Sir John Maitland, a younger brother of Lethington, was secretary and exercised the chief influence in the government. Advantage was taken of the royal majority to pass an Act annexing to the crown all church lands under certain limited reservations. But, as all prior grants to lay impropiators were saved, and

the king was still allowed to grant feus of church lands, the nobles and landed gentry really profited most by this measure, which gave a parliamentary title to their estates derived from the church and the hope of future spoils. The Act was accompanied by a general revocation of all gifts made during the king's minority or by Mary after his accession. Another statute of constitutional importance renewed, and for the first time carried into effect, the law of James I. by which the lesser barons in the counties were excused from personal attendance and allowed to send representatives to parliament. This was a check on the nobles who had hitherto almost exclusively attended and ruled parliament. It was the first and only large deviation of the Scottish parliament from the feudal model of the *curia regis*.

Projects for the king's marriage had been on foot at an earlier period; but at last the choice fell upon Anne of Denmark. Elizabeth opposed the match; but James, perhaps tempted by the offer to surrender the Danish claim to Orkney and Shetland, perhaps also not unwilling to show he could choose for himself, was married to Anne by proxy. Anne set sail for Scotland, but was driven back by a storm. Accordingly James himself went to claim his bride, when the actual marriage was at once celebrated at Copenhagen, where he spent the winter. It was a political advantage both to the king and to Scotland to form a connexion with a kingdom which, though small, stood comparatively high at that time in Europe, and was completely independent both of England and of France. After the king's return the Presbyterian party was in the ascendant. It has been doubted whether the favour shown to it by James at this time was genuine, but without reason. He had been married, and the queen was crowned, by Robert Bruce, a leading minister, for whom he had a personal liking. Shortly before going to Denmark James had published a tract interpreting the Apocalypse in the well-known Protestant sense. Notwithstanding the failure of the Armada, the air was still full of Jesuit intrigues and Spanish plots. At no moment of his life was James less inclined towards the English form of the Reformation, which he described in a celebrated speech as retaining the superstition of the mass "without the liftings." A severe blow was given to Episcopacy in Scotland by Archbishop Adamson shortly before his death retracting in a published confession his writings against Presbyterianism. In 1592 parliament, led according to James Melville by Maitland, now Lord Thirlestane and chancellor, re-established Presbyterian church government. General assemblies were to meet once a year, and provincial assemblies or synods, presbyteries, and sessions were confirmed. The Act of 1584 conferring jurisdiction on bishops was rescinded, but there was no formal abrogation of the office. The assembly had asked for the repeal of the Act of Annexation of 1587, but this was not conceded. The landed interests were too powerful to allow of the Reformed Church receiving the patrimony of its predecessor. Shortly after the termination of the parliament the discovery of the plot of "the Spanish blanks" showed that the danger of a Catholic rising and foreign invasion was real. The conspiracy proved abortive, and two of its chief promoters (Huntly and Erroll) left Scotland; on their return three years later they publicly renounced Catholicism and conformed to the Protestant faith.

From the king's majority to his accession to the English throne, his relations to the nobles on the one hand and to the Presbyterian party led by the ministers on the other require to be kept in view as giving the key to a singularly and confused and changing course of events. After the death of Thirlestane in 1595, the king had to rely on his own counsel, of the value of which he had an overweening

Re-establishment of Presbyterianism.

Relations between church and state.

opinion. He had studied the theory of kingcraft and wrote the *Basilicon Doron* expounding it. He fancied that he really governed, while he was in fact drawn this way or that by the contending forces which emerged in this revolutionary epoch. In spite of occasional displays of resolution, his character was at bottom weak. It was the destiny which conducted him to the English throne that saved him from the dangers of his situation in Scotland. A nobleman, who, although only connected by his mother with Mary's Bothwell, seemed to inherit the reckless daring of his predecessor in the title, thrice attempted and once for a short time succeeded in seizing the royal person and assuming the reins of government. But James, who was not without adroitness in baffling plotters by arts similar to their own, escaped from his custody. Towards the Catholic lords his policy was not to proceed to extremities, but to keep them in hand as a counterpoise to the extreme Protestant party. He prudently allowed the finances to be managed after Thirlestane's death by a committee, called from its number the Octavians, on which both Catholics and Protestants acted,—Seton, afterwards Lord Dunfermline, the president of the session, and Lindsay of Balcarres being the leading members. With their advice James set himself against any measures which the Protestant ministers proposed for the restoration or increase of the revenues of the church. It was this critical point of money, the assertion of the royal supremacy in spiritual matters, and the favour the king showed to the Catholics which led to the quarrel between him and the ministers. At a convention of the estates at Falkland and then more strongly as one of a deputation sent by the ministers from Cupar, Andrew Melville, in the spirit and manner of Knox, made his well-known speech to "God's silly vassal" on the two kingdoms and the two kings. Although James, frightened by this vehement language, made promises that he would do nothing for the Catholic lords till they had made terms with the church, it was impossible that a quarrel, whose roots were so deep, as to the limits of the royal authority and jurisdiction in matters ecclesiastical could be appeased. Neither party to it could see how far each overstepped the bounds of reason. The king was blind to the right of freedom of conscience which Protestantism had established as one of its first principles. Melville and the ministers were equally blind to the impossibility of any form of monarchy yielding to the claim that the members of an ecclesiastical assembly should use the name of Christ and the theory of His headship over the church to give themselves absolute power to define its relations to the state. Other occasions quickly arose for renewing the controversy. A violent sermon by Black at St Andrews gave a favourable opportunity to James of invoking the jurisdiction of the privy council, and the preacher was banished north of the Tay. Soon afterwards a demand made on the king in consequence of a sermon of another minister, Balcanquhall, and a speech of Bruce, the king's former favourite, that he should dismiss the Octavians, led to a tumult in Edinburgh, which gave James a pretext for leaving the town and removing the courts of justice to Linlithgow. Supported by the nobles, he returned on New-Year's Day 1597, received the submission of the town, levying a severe fine before he would restore its privileges as a corporation and withholding from it the right of electing its own magistrates or ministers without the royal consent. Emboldened by this success, James now addressed himself to the difficult problem of church and state. He did not yet feel strong enough to restore Episcopacy, perhaps had not quite determined on that course. The ingenious scheme due to Lindsay of Balcarres was fallen on of introducing representatives of the church into parliament without naming them bishops. This would have the twofold effect of

diminishing the authority of the general assemblies and of conferring on parliament a competency to deal with matters ecclesiastical. Parliament in 1597 passed an Act that all ministers promoted to prelacies (*i.e.*, bishoprics or abbacies) should have seats in parliament, and remitted to the king with the general assembly to determine as to the office of such persons in the spiritual policy and government of the kirk. Accordingly James summoned successive assemblies at Perth and Dundee, where there were two sessions in 1597, and finally at Montrose in 1600, selecting those towns in order to procure a good attendance from the north, always more favourable to royalty and Episcopacy and less under the influence of the Edinburgh clergy. By this and other manœuvres he obtained some concessions, but not all that he desired (see PRESBYTERIANISM, vol. xix. Gowrie pp. 681-682). It was the Gowrie conspiracy (5th August 1600) whose failure gave him the courage and the ground for finally abandoning the Presbyterians and casting in his lot with the bishops. Repeated investigations at the time and since cannot be said to have completely cleared up the mystery of this outrage. The most probable solution was afforded by the discovery several years afterwards of a correspondence between Gowrie and Logan of Restalrig which pointed to the seizure of the person rather than the murder of James as the object of the plot. More important than this object, which failed, was the sequel. The Ruthvens, who were chiefly implicated, were amongst the most prominent of the Protestant nobility, and the Presbyterian ministers with few exceptions refused to accept James's own account of what had happened, confirmed though it was by depositions of various noblemen who were with the king at the time. They even insinuated that the plot had not been by but against Gowrie at the king's instance. Although James by arguments and threats at last extorted an acknowledgment of the truth of his account from all the ministers except Bruce, who was deprived of his benefice and banished for his contumacy, the insult and the injurious suspicions were never forgiven.

In October, with the consent of the convention of estates, he appointed three bishops to vacant sees, and they sat in parliament, though as yet without any place in the government of the church, which was still Presbyterian, and with no sanction of course from the assembly or the ministers. James had to assume the English crown before Episcopacy could really be restored. This crisis of his career was not long delayed. Already Elizabeth's death was being calculated on, and her courtiers from Cecil downwards were contending for the favour of her heir. She died on 24th March 1603 and James was at once proclaimed her successor in accordance with her own declaration that no minor person should ascend her throne but her cousin the king of Scots. Leaving Edinburgh on 5th April, James reached London on 6th May, being everywhere received with acclamation by the people. Thus peacefully at a memorable epoch in the history of Europe was accomplished the union of South and North Britain. Often attempted in vain by conquest, it was now attained in a manner soothing the pride of the smaller country, without at first exciting the jealousy of the larger, whose interest was, as Henry VII. prophesied, sure to predominate. To James it was a welcome change from nobles who had threatened his liberty and life, and from ministers who withstood his will and showed little respect for his person or office, to the courtier statesmen of England trained by the Tudors to reverence the monarch as all but absolute, and a clergy bound to recognize him as their head. To Scotland, a poor country, and its inhabitants, poor also but enterprising and eager for new careers, it opened prospects of national prosperity which, though not at once, were ultimately realized. It was an immediate gain that

1603-1618. border wars and English and French intrigues were at an end. This more than counterbalanced the loss of the court, a loss which probably favoured the independent development of the nation. For the present no change was made in its constitution, its church, or its laws. The Reformation had continued the work of the War of Independence. Scotland no longer consisted only of the prelates, the nobles, and the landed gentry. The commons, imperfectly represented in parliament by the burghs, not yet wealthy enough to be powerful, had found a voice in the assemblies of the church and leaders in its ministers and elders.

Superstition did not fall with the fall of the church of Rome nor licence with the decline of the nobility. Rather, both took new forms of extreme virulence and threatened to impede the national progress; but both were exposed to the light of public discussion and the growth of public opinion. The contact with the more cultured south was of immense value. Scotland, now beginning to use in the services of the church, in the proceedings of the courts, and in printed books the vulgar tongue, which differed only as a dialect from that of England, was admitted to the freedom of the noblest language and literature in Europe, then in its prime. The arts which increase the convenience and pleasure of daily life spread northward with the increase of wealth. Science, starting on a new method taught by the great English philosopher, was introduced and after a time eagerly prosecuted. Commerce, for which the Scots had a natural aptness, found new fields. And all these benefits were procured without any sacrifice of the independent spirit which had been derived from their forefathers. Even the separate intercourse with the Continent—with France, Germany, Holland, and Scandinavia—from which Scotland had already received so much advantage, though not quite so intimate with France as before, continued. But before the blessings of the union could be fully realized a century was to intervene, which at times seemed to hide if not to bury them,—a century of civil war and religious controversy. At the moment when James ascended the throne and proclaimed the virtues of peace it required no far-sighted observer to discern elements of discord which might at any moment burst in storm. To hold Papal Ireland, Episcopal England, and Presbyterian Scotland united under one sceptre was a task of infinite difficulty, not lessened because in each there was a minority who dissented strongly from the prevailing opinion as to church government and doctrine. The sudden separation from Rome gave birth to every variety of religious opinion, and Scotland became even more than England a land of sects. The constitution of the civil government was a problem not yet solved. In England the Tudor sovereigns had sapped the principles of the parliamentary constitution established in the times of the Plantagenets, and fortunately recorded in writings which could not be forgotten. In Scotland such principles had never yet been practically adopted. Ireland was ruled as a dependency on the principle of subjection.

At this point in the treatment of some historians the history of Scotland ends. Juster views now prevail. Neither the union of crowns nor of parliaments really closes the separate record of a nation which retained separate laws, a separate church, a separate system of education, and a well-marked diversity of character. But a great part of the subsequent history of Scotland is necessarily included in that of Great Britain, and has been treated under ENGLAND (*q.v.*). Considerations of space and proportion make it necessary that what remains should be told even more rapidly than the narrative of what preceded the accession of James to the English throne. James during the first half of his reign as sovereign of Great Britain allowed himself to be mainly guided by Robert

Cecil, Lord Salisbury, the son of Burghley, an hereditary statesman of great ability as an administrator. But on two subjects closely connected with Scotland the king had decided opinions of his own. He desired to see Scotland bound to England, not merely by the union of the crowns, but by a union of the parliaments and laws, and if not an immediate an ultimate union of the churches. He was equally determined that the church in both countries should combine a moderate Protestant doctrine—a *via media* between Rome and Geneva—with Episcopal government. Both desires were founded on prudent policy and might possibly have been accomplished by a stronger and wiser monarch. But the former was opposed by the jealousy of England and the pride of Scotland. The latter could not be accomplished in Scotland without force, so deep were the roots which Presbyterianism had struck. James attempted to carry both measures in a manner calculated to raise rather than to overcome opposition. The union scheme was brought before his first English parliament, and commissioners were appointed to treat with the Scottish commissioners nominated somewhat reluctantly by the parliament of Perth. The commissioners met, but differences at once emerged on the topics of freedom of trade between the two countries, to which the English were averse, and the acceptance of the laws of England, which the Scots objected to. Two important points were carried by a declaration of the law rather than agreement of the commissioners,—that subjects born in either country after the accession (*post nati*) should have the full privileges of subjects and not be deemed aliens, and that those born before should be capable of denization and so of inheriting or acquiring land in England, though not of political rights or offices. The English parliament of 1607, however, refused to sustain the decision of the Exchequer Chamber in favour of the *post nati*, although it consented to abolish the laws which treated Scotland as an enemy's country and made arrangements for the extradition of criminals. The religious or ecclesiastical question was first brought to a point in England at the Hampton Court conference, which met on 14th January 1604, in which trifling concessions were made to the Puritans, chiefly as to the observance of Sunday and the removal of the Apocrypha from the Authorized Version. In Scotland Episcopacy was restored by a series of steps which were gradual only for the purpose of overcoming opposition, not because James hesitated as to the end in view. At length the parliament of 1612 repeated the Act of 1592, so that Episcopacy was now once more established in Scotland by law, but contrary to the wish of the majority of the nation and under circumstances which made it the symbol of absolute government. While thus resolute in favour of Episcopacy, James showed no sign of leaning to the Roman Church, although efforts to convert him had been made at an earlier period in Scotland. The Armada, now followed by the Gunpowder Plot, convinced him that he had nothing to hope for from the Papists but open war or secret conspiracy.

After the death of Cecil James gave way to that influence of favourites to which he had shown himself prone in his younger years; but in the affairs of Scotland, which produced much trouble and little profit, Somerset and Buckingham took no interest and James was his own master. After an absence of fourteen years he visited his native country. He had promised to return every three years, but the business and pleasures of the English court detained him. His main object was to carry out still further the uniformity of the church, in which the bishops had not succeeded in establishing the same service as in England. This object was apparently attained in 1618 by the adoption of the Five Articles of Perth (see vol. xix. p. 682), but at the cost of sowing the seed of religious war. From of Perth.

Re-establishment
of Episcopacy.

Five
Articles

this time to James's death little occurred worthy of note in the history of Scotland. A parliament in 1621, held under the marquis of Hamilton as commissioner, confirmed the Five Articles, though by a majority that is narrow when the power of the king in a Scottish parliament is kept in view, and only on an assurance from the commissioner that no further ecclesiastical innovations would be proposed. It also introduced a new mode of electing the Lords of the Articles, which practically gave the whole influence to the bishops, the nominees of the crown. As this body prepared the entire business of a parliament in which there was no power of bringing in Bills by private members, this was a long step in the direction of absolute government. James, in fact, declared in one of his speeches to the English parliament that, according to the Scottish constitution, he was master of its whole proceedings, with the absolute power of initiative as well as of veto. His declaration was an exaggeration, for there were well-known precedents of the estates passing laws without the royal assent; but the Scottish constitution was in a fluid state without the guarantee of written charters or clearly defined rules as to the refusal of supplies, and above all without an independent House of Commons to represent the wishes of the people and demand redress for their grievances. The only part of the policy of James on which it is possible to look back with satisfaction was that which concerned colonization, then called "plantation." This gave an outlet to the increasing population, while it advanced the civilization of the countries to which the settlers went. The earliest of these schemes, the "plantation" of the Hebrides by a number of gentlemen of Fife called "undertakers," had comparatively little effect, but, apart from it, some progress was made in introducing order and law in the Highlands and islands, where the people were still in a semi-barbarous condition. More important was the plantation of Ulster, chiefly by Scottish farmers, whose descendants still retain a Scottish dialect and a Presbyterian church. But as an augury of the future the colonization of Nova Scotia, though attempted in an arbitrary manner, was of the greatest consequence. It was a commencement of the great migration to the New World across the Atlantic and to the other colonial possessions of Great Britain, in which, equally to their own profit and that of the empire, the Scottish nation in the two following centuries was to play so great a part. On 22d March 1625 James died, leaving to his son Charles a burden of government heavier than when he had himself undertaken it. His apparent success in carrying to a further point the absolute and arbitrary principles of the Tudor sovereigns scarcely concealed the real failure. Ireland, with difficulty kept down, was not really subdued. The parliament of England had given unmistakable signs that it was only waiting an opportunity to restore the constitution on the old basis. The religious and political instincts of the Scottish nation, suppressed by force, were gathering strength to reassert themselves if necessary by revolutionary methods. An exhausted exchequer, which James had attempted to fill by monopolies, and by the sale of offices and honours and so-called benevolences, added to the other difficulties of carrying on the government, but was fortunately, as in the time of the Plantagenets, to afford the occasion for maintaining the constitutional struggle.

8. *Period of Civil Wars, Charles I. to Revolution.*—Eight years after his accession Charles I. revisited Scotland (1633). During these he had pursued his father's policy. No Scottish parliament sat, though a nominal one was adjourned annually between 1628 and 1633. No general assembly met, but the restoration of Episcopacy and the uniformity of the churches were steadily prosecuted by royal influence and the exercise of the royal prerogative.

In spite of the opposition of a convention of the estates, 1603-1637, which nearly ended in bloodshed, the king carried out the resumption of tithes for the benefit of the clergy from their lay impropiators. The revocation in 1625 of all grants in prejudice of the crown, whether before or after the Act of Annexation of 1587, was superseded by a new measure, ratified by parliament in 1633, declaring the terms on which the tithes might still be acquired and valued by the heritors. Few measures have been of greater importance in their bearing on Scottish history. The revocation alienated the nobles and landed gentry, who dreaded that when so much had been, still more might be, taken from their profits in the Reformation. The new valuation left the parochial clergy in the position of a poor class, with interests antagonistic to the gentry, whose income was diminished whenever the ministers attempted to raise their scanty stipends. The loyalty for which the Scots had been distinguished had received a shock by the removal of the court, and this was a second and more serious blow. Yet when Charles came to Edinburgh and received the crown at Holyrood (18th June 1633) he was well received. The disaffection still lay beneath the surface. Although the Five Articles of Perth were not rigidly enforced, all the court could do was done to introduce the most obnoxious,—the practice of kneeling at the communion, which Presbyterians deemed a relic of the mass. The question of a liturgy was not allowed to rest. It was brought before the Scottish bishops in 1629; their draft was submitted to Laud, who, detecting in it Low Church doctrine as to baptism and traces of Knox's *Book of Common Order*, refused his approval and advocated the introduction of the English Prayer Book, by which uniformity would be secured. Though this was not yet attempted, Charles took the same view as the zealous and ambitious churchman who was now his guide in ecclesiastical matters. When he came to Scotland Laud was in his suite, and the coronation was conducted with a ritual which "had great fear of inbringing of Popery." Edinburgh was created a bishopric. The parliament over which Charles presided passed thirty-one Acts, "not three of which," says a contemporary, but were most "hurtful to the liberty of the subject." One in particular declared in a large sense the royal prerogative, and by an ill-omened conjunction gave the king power to regulate the apparel of churchmen. It was disputed in parliament whether this Act was carried, but the presence of the king, who took notes of the votes, overawed opposition. About a year after Charles left Scotland the trial of Lord Balmerino, which grew out of the Acts of this parliament, gave the first impulse to the Scottish revolution. That nobleman, who had possessed a copy of a petition protesting against the Acts then carried, was tried under the old Acts against leasing-making or sedition and condemned by a majority of one upon a single charge,—that of not revealing the petition and its author (March 1635). Although Charles respited the capital sentence, the condemnation deeply stirred the people, who saw almost the only mode of constitutional redress, that by petition, declared illegal and an act capable of innocent interpretation treated as a heinous crime. Before the trial the appointment of Spotswood as chancellor, the first ecclesiastic who held the office since the Reformation, and the admission of nine bishops to the privy council, increased the disaffection. In 1636 the *Book of Canons*, ratified by the king the year before, was published at Aberdeen, containing the most distinct assertion of the royal supremacy and a complete Episcopal organization.

At last on Sunday, 23d July 1637, the much-dreaded introduction of liturgy, the use of which had been enjoined by the *Canons* and announced on the preceding Sunday, was introduced

1637-1639. in the service of St Giles Cathedral, Edinburgh. For the most part a transcript of the English Prayer Book, it deviated slightly in the direction of the Roman ritual. Its use provoked an uproar, of which the stool flung at the dean by a woman, Jenny Geddes or Anne Mein, was the symbol, and brought the service to a close,—Lindsay, the bishop, being with difficulty saved from the violence of the mob. A similar riot took place in Greyfriars church, where the bishop of Argyll attempted to use the book. There had been no such tumult since the Reformation. The privy council arrested a few rioters, but suspended the use of the service book until the king's pleasure was known, and when Laud at the king's request wrote that its use should be continued no one dared to read it in Edinburgh or throughout Scotland except in a few cathedrals. Meantime numerous supplications against it and the *Canons*, joined with accusations against the bishops, were sent to Charles. His only answer was the removal of the courts and privy council to Linlithgow and an order to all ministers who signed the supplications to leave Edinburgh. There followed fresh supplications and protests, in which some of the nobility, especially Rothes, Balmerino, Loudon, Montrose, and a prominent lawyer, Johnston of Warriston, joined with the ministers. Hope, the king's advocate, secretly favoured them. Traquair, a leading member of the privy council, went to London to press on Charles and Laud the gravity of the situation; but, though ambiguous concessions were made, the king and his advisers were determined to insist on the service book. In a proclamation issued at Stirling (20th February 1638) the king assumed the responsibility of its introduction; but the opposition was too powerful to be put down by words. Its organization, begun by commissioners headed by Rothes, continued in committees of the nobles, lesser barons, ministers, and burghs, was now called "the Tables" from those in the Parliament House, where they sat sometimes separately, sometimes collectively, and formed a standing assembly which defied the king's council. The Covenant, prepared by Alexander Henderson, leader of the ministers, and Johnston of Warriston, was revised by Rothes, Loudon, and Balmerino, and accepted by upwards of two hundred ministers who had gathered in Edinburgh. "It was signed at Greyfriars church on 1st March 1638, first by many of the nobles and gentry, then by three hundred ministers and a great multitude of the people. Copies were at once despatched throughout the country, and with few exceptions, chiefly in St Andrews and Aberdeen, it was accepted by all ranks and classes. Its form was suggested by the bonds for material aid of which Mary's reign had given so many examples, but the new name pointed to a Biblical origin, and the parties were not the nobles and their retainers but God and His people. While nominally professing respect for the royal office, it was entered into, as it anxiously reiterated, for "the defence of the true religion (as reformed from Popery) and the liberties and laws of the kingdom." The spirit in which it was signed was that of a religious revival. Many subscribed with tears on their cheeks, and it was commonly reported that some signed with their blood. Charles could not relish a movement which opposed his deepest convictions as to church government and under the form of respect repudiated his supremacy; but, destitute of power to coerce the Covenanters, he was compelled to temporize. Hamilton as his commissioner offered to withdraw the service book and *Book of Canons*, to give up the Court of High Commission, and to allow the Articles of Perth to remain in abeyance. A new confession called the "negative," framed on that of 1580, and a new covenant called the "king's," on the model of one drawn in 1590, which bound the signers only to stand by the king in suppressing Papists and

promoting the true religion, were devised, but failed to satisfy even the least zealous Covenanters.

An assembly at last met in Glasgow, over which Hamilton ^{Assembly of Glasgow.} presided, with faint hope that matters might still be accommodated. Hamilton had orders to dissolve it if it proved to be intractable. The members had been chosen by the influence of the Tables, according to a mode invented in 1597. Three ministers represented each presbytery and an elder the laity of the district. The burghs also sent representatives. The Covenanters had declared their intention of prosecuting the bishops, and a libel laid before the presbytery of Edinburgh was read in the churches. Charles on his side announced that he challenged the mode of election and would not allow the prosecutions. He was already preparing for war. At the first sitting Alexander Henderson was chosen moderator, and Johnston of Warriston clerk. In spite of the commissioner's attempt to raise the question of the validity of elections, the assembly declared itself duly constituted. A letter from the bishops was read declining its jurisdiction, and the commissioner, while offering redress of grievances and that bishops should be responsible to future assemblies of clergy, declared that the present assembly was illegal in respect of the admission of lay representatives. Discussion was useless between a commissioner and an assembly whose power to act he denied. He accordingly dissolved it in the name of the king and left Glasgow; but this only stimulated its members. It annulled the pretended assemblies between 1606 and 1628, condemned the service book, *Book of Canons*, *Book of Ordinances*, and the High Commission Court, deposed the bishops on separate libels which set forth various acts of immorality or crime, many of which were false, declared Episcopacy to have been abjured in 1580, and condemned the Five Articles of Perth. It concluded its month's labours by restoring Presbyterian church government.

The distance from such an assembly to the field of arms ^{Appeal to arms.} was short, and on 7th June 1639 the army of the Covenanters under Alexander Leslie, a general trained in the service of Gustavus Adolphus, met the royal troops led by the king at Dunse Law. Charles, though slightly superior in numbers, had an undisciplined army and no money to maintain it, while Leslie had trained officers and troops animated by religious zeal. Their colours were stamped with the royal arms, and the motto "For Christ's Crown and Covenant" in golden letters. Councils of war as well as religious meetings were held daily, and the militant fervour of the Covenanting troops steadily rose. Charles declined to engage such an army and general, and by the Pacification of Berwick (18th June) both parties agreed to disband, and Charles to issue a declaration that all ecclesiastical matters should be regulated by assemblies, and all civil by parliament and other legal courts. On 1st August a free general assembly was to be held at Edinburgh, and on the 20th a free parliament in which an Act of Oblivion was to be passed. The assembly met as appointed and, without explicitly conforming, re-enacted the principal resolutions of that of Glasgow, and declared that the Covenant should be subscribed by every one in office and authority. Before it separated it condemned the *Large Declaration*, a pamphlet by Balcanquhall, dean of Durham, published in the king's name, which gave an adverse narrative of recent events in Scotland. The parliament effected little legislation, but showed its disposition by abolishing Episcopacy and reforming the election of the Lords of the Articles, of whom eight were henceforth to be chosen by the nobles, lesser barons, and burghs respectively. The predominance of the king and the church was thus removed from the body which initiated all legislation. Charles had beforehand determined not to sanction the abolition of Episcopacy, and the parliament was prematurely adjourned (14th

November) without the royal assent to its Acts. It was evident that the struggle between the king and the Scots would be renewed, and both parties reluctantly had recourse to allies whose choice showed their sense of the crisis. Charles summoned an English parliament; but the three weeks' session of the Short Parliament was spent in a vain attempt to obtain redress for its own grievances. It separated without granting supplies, and the king had to depend on private loans. The Scots negotiated with the French king; but Richelieu prevented the unnatural alliance of the Catholic king and the Covenanters. The Scots took the first step in the war. The army under Leslie crossed the Tweed and, forcing the passage of the Tyne at Newburn, occupied Newcastle. Charles, who had his headquarters at York, paralysed by the want of money and new demands to summon an English parliament, was driven to accept a truce at Ripon (2d September 1640), under which the Scottish army was to receive a subsidy to relieve the northern counties from contributions. Parliament was summoned to Westminster for 3d November; but its first act was the impeachment of Strafford. Until a pledge was given by his death that Charles would recognize the limits of monarchy, the Parliamentary leaders thought it safer that the Scots should hold the north of England. Peace was concluded by the Act immediately following that of Strafford's attainder, by which £300,000 was ordered to be raised as "friendly assistance and relief promised to our brethren in Scotland."

Charles's
conces-
sions to
the Scots.

The king now made up his mind to revisit Scotland, hoping there to find a way out of his English troubles. He had received a letter from MONTROSE (*q.v.*), urging him to come and gain the Scots by a moderate policy. He came to Edinburgh early in August 1641 and a parliament met under his presidency, when he not only ratified the Acts substituting a Presbyterian for the Episcopal form of church government but sanctioned important reforms. The Lords of the Articles were in future to be elected by each of the three estates separately, the burghs taking the place of the bishops; the Court of High Commission was abolished; arbitrary proclamations were prohibited; the officers of state and the judges were to be chosen with the advice of parliament; and, following an English Bill, parliament was to meet every third year. During his stay in Scotland occurred "the Incident,"—still spoken of as mysterious by historians, some of whom liken it to the English incident of the arrest of the five members. Argyll and Hamilton had led the party which carried all the measures of this parliament. Montrose had been committed to the castle by the estates before the arrival of Charles on a charge of plotting against Argyll by false accusations to the king. From his prison he renewed his charges against both Argyll and Hamilton, whom he accused of treason. Charles about this time unwisely attended parliament with an unusual guard of 500 men, which gave Hamilton and Argyll a pretext for asserting that their lives were in danger and to quit Edinburgh. They soon returned and a favourable committee of investigation let the matter drop. Argyll was now more powerful than ever. In November the king returned to London, which became during the next year the centre of the events which led to the Civil War.

Civil
War.

The progress of the Civil War belongs to English history. Here only the part taken by the Scots can be stated. They were now courted by king and Parliament alike. The campaign of 1642-43 under Essex proved indecisive, and the Parliament sent commissioners headed by Sir Henry Vane to Edinburgh in the autumn of 1643, who agreed to the "Solemn League and Covenant," already accepted by the Scottish assembly and parliament, and now ratified by the English parliament and the assembly of divines

at Westminster. This memorable document, whose name 1639-1647. showed its descent from the National Covenant, bound the parties to it "to preserve the Reformed Church in Scotland and effect the reformation of that in England and Ireland in doctrine, worship, discipline, and government according to the Word of God and the example of the best Reformed Churches." But the alliance with the Scottish Covenanters did not produce the advantage expected from it. The victory of Marston Moor was due to Cromwell and his Ironsides, who were Puritans and Independents. The Scots, who formed the centre of the Parliamentary army, were repulsed. In the autumn, although the Scots took Newcastle, the king gained ground in the west, where Essex, the general who represented the Presbyterians, narrowly escaped capture. Next year Montrose, in the brilliant campaign on which his military fame rests, made a formidable diversion in the Highlands. With dazzling rapidity, at first supported only by a handful of followers, but gathering numbers with success, he erected the royal standard in Dumfries; then, passing to the Highlands, after the victory of Tippermuir he took Perth, and defeated Lord Lewis Gordon at the Bridge of Dee. Next, after ravaging the county of Argyll, he marched to Inverness, but returned to defeat Argyll at Inverlochy, won further victories at Auldearn near Nairn and Alford on the Don, and by that of Kilsyth appeared to have recovered Scotland for Charles. The fruit of all these victories was lost by his defeat at Philiphaugh (13th September 1645) by Leslie. Meantime Charles had lost the battle of Naseby, and next year was forced to take refuge at Newark with Leslie, whom he had created earl of Leven. As the result of his surrender he ordered Montrose, who was again raising the Royalists in the Highlands, to lay down his arms; and the Scottish army in England, no longer on good terms with the Parliament, returned to Newcastle, that, being nearer home, it might dictate the terms of its services. Here it remained eight months, during which a strenuous attempt was made to force Charles to accept the Covenant. Alexander Henderson argued the matter with him in a singularly temperate correspondence. But the king was bound to Episcopacy by hereditary sentiment and personal conviction. Another negotiation was going on at the same time between the Scottish army and the English Parliament for arrears of pay. On 30th January 1646 they surrendered the king to the English commissioners, the question of pay having been settled by the receipt of £200,000 a few days before and a like sum a few days after that date. There was no express condition which bound the two circumstances together, but their concurrence cannot have been accidental.

Charles
I.'s nego-
tiations
with the
Scots.

In his captivity Charles renewed his negotiations with the Scottish estates, over which Hamilton had now acquired influence, and a compromise was at last agreed to at Newport in the Isle of Wight by which he promised to confirm the League and Covenant by Act of Parliament, to establish Presbyterianism and the Westminster Confession, which as well as the Directory had been adopted by the Scottish parliament for three years. After that period it was to be fixed by the king and parliament what form of church government was most agreeable to the Word of God, and this after consultation with the assembly was to be established. The Scots consented that in the meantime the Covenant should not be enforced on those who had conscientious scruples, and that the king might continue to use the English service. The Covenanters who accepted these terms, and who formed the most moderate section, received the name of Engagers. Relying on the promised support from Scotland, Charles rejected the proposals of the English Parliament. That body had now broken with the army, in which the Independents and Cromwell were

1647-1654. fast acquiring supremacy. Their division afforded an opportunity for renewing the war, and Hamilton invaded England in the following year, but was routed at Preston (17th August 1648) by Cromwell. A party led by Argyll had opposed the compromise with Charles effected by Hamilton. They were chiefly strong in the south-west, and in the autumn of this year a band of them raised by Lord Eglinton marched to Edinburgh and were met by Argyll, who put himself at their head. Their numbers had risen to 6000, a sufficient force to give them supreme influence over the Government. It was from this—the "Whiggamore" raid—that the name of Whigs took its rise. The meeting of estates now resolved to renew the Solemn League and Covenant, and by an Act called the Act of Classes removed from the courts and all places of public trust those who had accepted the "late unlawful engagement." The English Parliament at this point took an exactly opposite course and showed signs of conciliation with the king; but the frustration of its action by the energetic policy of Cromwell was quickly followed by the trial and execution of the king. Hamilton, who had been taken after Preston, soon after shared the same fate.

Charles II.'s acceptance of Covenantant.

The death of Charles altered in a moment the relations between England and Scotland. In the former Cromwell became all powerful, while in the latter the moderate Presbyterians attached to the principle of monarchy and the hereditary line at once proclaimed Charles II. Charles II. had been brought up with different views of royalty from those of the Covenanters, and Scotland was not prepared to accept a king except on its own terms. A commission from the estates and from the assembly was at once sent (March 1649) to The Hague, where the young king was. Charles promised to maintain the government of Scotland in church and state as settled by law, and particularly the Covenant, Confession of Faith, and Presbyterian system, but declared that he could not impose the Solemn League and Covenant on England and Ireland without the consent of their parliaments. The commissioners returned dissatisfied with this answer and with the presence at court of Montrose, by whom it had probably been framed. But in October Ormonde's Irish expedition failed, and Cromwell, already master of England, had reduced Ireland by force of arms; both parties felt inclined to renew the treaty. At length it was agreed that Charles should be accepted as king on condition of his subscribing the Covenant, establishing Presbyterian church government and worship, sanctioning the Acts of Parliament passed in his absence, and putting in force the law against Catholics. In return he stipulated for the free exercise of his royal authority, the security of his person, and the aid of a Scottish army. The treaty was closed in these terms on 9th May 1650, and early in June Charles set sail for Scotland. On the voyage he was forced to consent to further conditions which the Scottish parliament ordered the commissioners to impose, in particular to exclude from his court all persons within the first and second classes of the Acts of 1646 and 1649, and to keep the duke of Hamilton, brother of the late duke, and certain other persons out of Scotland. On Sunday, 23d June, at the mouth of the Spey he subscribed the Covenant and landed. Whilst Charles was negotiating with the commissioners, the expedition of Montrose, which he had encouraged but afterwards disowned, had come to an end by the capture of its gallant leader in Caithness. He was executed in Edinburgh a month before Charles reached Scotland.

Alarmed at the prospect of another Scottish invasion, Cromwell with wonderful rapidity transferred his forces from Ireland, and within a month after Charles landed crossed the Tweed and advanced to Edinburgh. Baffled in all attempts against the town by the tactics of David

Leslie, the nephew of Leven, he was forced from want of supplies to retire. His retreat was nearly cut off, but he gained an unexpected victory at Dunbar (3d September 1650) over that able general, who had been induced by the over-confidence of the ministers in his camp to descend from the Doon Hill and attack the English on level ground. So complete was the defeat that the south of Scotland fell into Cromwell's hands. Meantime Charles had attempted to escape from the restraints of the Presbyterian camp by "the Start," as it was called, from Perth to Clova, where he hoped to raise the loyal Highlanders; but, not getting the support expected, he returned. In the beginning of next year, after renewing his subscription to the Covenant and submitting to the imposition of a day of fasting and humiliation on account of the sins of his family, he was crowned at Scone on 1st January 1651. Argyll, still the leader of the Covenanters, placed the crown on his head, a circumstance which he recalled when he lost his own. The invasion of England was now determined on,¹ and, Cromwell having been unable to intercept the royal army, it advanced as far as Worcester. Here, after effecting a junction with Fleetwood, Cromwell with a much smaller force routed the king's army on the anniversary of Dunbar. Charles had a hairbreadth escape from capture, and after many adventures crossed from Brighton to France. The last great battle of the Civil War placed England in the hands of the army and its general.

Scotland offered more resistance; but Monk, whom Cromwell had left in command, stormed Dundee and terrified the other towns into submission. Although a nominal union was proclaimed and Scotland was allowed members in the English parliament, it was really governed as a conquered country. In 1653 the general assembly was summarily dissolved by Colonel Cotterel. Next year Monk was sent by the Protector to quell a Royalist rising, which, first under the earl of Glencairn and afterwards under Middleton, a soldier of fortune, began to show head in the Highlands. Monk, as usual, carried out effectually the work he was sent for and, partly by an indemnity which many leading Royalists accepted and partly by the defeat of Middleton at Lochgarry (25th July 1654), reduced the Highlands. He also dispersed the general assembly, which made another attempt to sit. Strong forts were built at Leith, Ayr, Inverness, and Glasgow, and Monk with an army of 10,000 men garrisoned the country. A Protectorate of state, containing only two Scottish members, was appointed, but matters of importance were referred to Cromwell and his English council. The administration of justice was committed to four English and three Scottish judges in place of the Court of Session, with the view of introducing English law. The use of Latin in legal writs was abolished. A sequestration court to deal with the forfeited estates sat at Leith. A separate commission was issued for the administration of criminal justice, and theft and highway robbery were stringently inquired into.

¹ With the view of procuring forces for the expedition, a reconciliation was effected between the Royalists and the more moderate Covenanters by a resolution to the effect that all persons not excommunicated should be allowed to serve in the army. This new party, now called "Resolutioners," was practically the same as that formerly known as the "Engagers." A minority, on the other hand, became known as the "Protestors" or "Remonstrants" (compare vol. xix. p. 683). This division of the Covenanters into a moderate and an extreme section continued throughout the whole of the 17th century. The Engagers and Resolutioners were the ancestors of the Established Presbyterian Church; the Protestors or Remonstrants of the Seceders or Dissenting churches, each of which maintained with unabated confidence, however small its numbers, that it was the true church of Scotland, the only church really faithful to the Covenant and Christ as the head of the church. Both parties for long regarded Episcopalians and Romanists alike as "malignants," standing without the pale of the church, with whom no compromise could be made.

and punished. In the church the Presbyterian form of service and the system of presbyteries and synods were allowed to continue, but the stipends of ministers depended on their being approved by a commission appointed by Cromwell. Justices of the peace were introduced for local business. Free trade and an improved postal system between the two countries were established. The universities were visited. In all departments of government there was vigour and the spirit of reform, so that it was admitted even by opponents that the eight years of Cromwell's usurpation were a period of peace and prosperity. There was undoubtedly one exception. The taxation was severe. A land-tax of £10,000 a month, afterwards reduced to £6000, and levied upon the valued rent under a valuation of Charles, far exceeded any subsidy before granted to the crown. Customs and also excise duties, recently introduced from England, were diligently levied; so also were the rents of the crown and bishops' lands. Altogether it was estimated that a revenue of £143,000 was collected in Scotland. But this had to be supplemented by an equal sum from England to meet an expenditure of £286,000. As nearly the whole was spent in Scotland and the burden of taxation fell on the upper classes, the nation generally did not feel it so much as might have been expected. It was a maxim of Cromwell's policy to improve the condition of the commons, and in one of his last speeches he claimed in memorable words to have effected this in Scotland. In this respect the Commonwealth and protectorate continued the political effect of the Reformation. The commonalty for the first time since the War of Independence acquired a consciousness of its existence and hope for the future. Cromwell, like former powerful rulers, aimed at uniting Scotland with England, but his proposals in this direction were premature. To Barebones's Parliament (1653), which met after the dissolution of the Long Parliament, five Scottish members were summoned, there being 134 from England, Wales, and Ireland. By the Instrument of Government and an ordinance following on it, Scotland was granted 30, while England had 400 members; but only 20 Scottish attended the parliament of 1654, and care was taken by Monk that they should be men attached to Cromwell's interest. When in his second parliament in 1656 he tried the experiment of a House of Lords, three Scotsmen were summoned, the quota of members to the Commons remaining as before. Cromwell's idea of a parliament was an assembly to ratify, not to discuss, his measures, and this, like his other parliaments, was speedily dissolved. Had it continued the Scottish representatives would have had little weight. Scotland continued to be governed by the council of state. On the death of the Protector his son Richard was proclaimed his successor in Scotland as well as in England, and 30 members were again returned to the new parliament, which, however, was almost immediately afterwards dissolved. The Restoration soon followed, though in Scotland there was no need of it, for Charles II. was already king. However beneficial the rule of Cromwell may be deemed, it had a fatal defect in the eyes of a people proud of their freedom. It was imposed and maintained by force. His death and the restoration of the ancient line of kings were looked on as a deliverance from oppression.

ments.

Restora-
tion.

The hopes of the Scots from Charles II. were doomed to speedy disappointment. So far from being grateful for the support they had given him in adversity, he looked back with disgust, as his grandfather had done, on the time when he was under the yoke of the Presbyterian ministers. Cromwell had shown the possibility of governing Scotland by military force and of raising a considerable revenue from it, and Charles took advantage of both lessons. From this date rather than from the earlier or

later union Scottish history assumes a provincial character. 1654-1664. Scotland was governed without regard to its interest or wishes according to the royal pleasure or the advice of the nobles who for the time had the ear of the king. The power of the clergy had been broken by Cromwell's policy and their own divisions. The party of the Resolutioners or moderate Presbyterians, some of whom now leant to Episcopacy, and the party of the Remonstrants were still irreconcilable, and their mutual hatred rendered the task of government easier. The burghs were not yet sufficiently organized to be a power in the state, and the nobles again resumed their old position as leaders with no rivals, for the bishops were shorn of their revenues and dependent on royal favour. For the first two years after the Restoration the government of Scotland was in the hands of Middleton, who had been created an earl. The measures of retaliation were few but signal. Argyll was tried and beheaded on a charge of treason, which could not have been established but for the treachery of Monk, who gave up private letters written to him when they both were supporting the Commonwealth. Guthrie, a leading minister of the Remonstrants, was hanged. Johnston of Warriston, two years later, was brought back from France and executed. No hesitation was shown as to the mode of governing Scotland. Parliament, under the presidency of Middleton, passed the Rescissory Act, annulling the Acts of all parliaments since 1640, declaring the Covenant no longer binding, and imposing an oath on all persons in office, not only of allegiance but of acknowledgment of the royal prerogative restored in all its fulness over all persons and in all causes. In August Lauderdale, who acted as secretary for Scotland in London, wrote to the privy council announcing the royal intention to restore Episcopacy, and, regardless of his oath, Charles sanctioned this by the first Act of the parliament of 1662. James Sharp, minister of Crail, who had been sent on behalf of the Resolutioners to Charles before his return, allowed himself to be easily converted to Episcopacy and was rewarded by his appointment as archbishop of St Andrews; his example was followed by other ministers of the same party. But the majority and all the Remonstrants stood firm; 350 were deprived of their livings, each of which became a centre of disaffection towards the Government, while their attachment to the Covenant was every day strengthened by persecution. The Covenant and Solemn League and Covenant were declared unlawful oaths, and all persons speaking or writing against the royal supremacy in matters ecclesiastical were incapacitated from office. Middleton had the immediate responsibility for these measures, and the condemnation and forfeiture of the new earl of Argyll, whose estates he coveted, under the old law against leasing-making increased the hatred with which he was regarded. His fall was due to an attempt to supplant his rival Lauderdale by the Act of Billeting, under which the Scottish parliament named by ballot twelve persons with Lauderdale at their head as incapable of holding public office. This and other Acts were carried out without the previous consent of Charles; Lauderdale persuaded Charles that his personal authority was in danger, and Middleton was called to court and sent as governor to Tangier, where he soon after died. The earl of Rothes was now appointed commissioner, but the chief influence was in the hands of Lauderdale, who continued to act as Scottish secretary in London.

Middleton.

Restoration of
Episcopacy.

The change in its rulers brought no relief to Scotland. Severe The declaration that the Covenants were illegal oaths was re-enacted and imposed on all persons in office who had not yet taken it. The old mode of electing the Lords of the Articles, which placed the election in the hands of the bishops, the nominees of the king, was restored. Sharp,

nanters.

1664-1681. not warned by the fate of Laud, procured the restoration of the Court of High Commission to enforce the laws against ecclesiastical offenders. Fines were imposed on all who absented themselves from their parish churches or attended the sermons of the deposed ministers. Sir James Turner was sent by the privy council to the western shires to prevent conventicles and field preaching and to enforce the law as to conformity; and his exactions, with the burden of maintaining his soldiers quartered upon all persons suspected of favouring the ousted ministers, led to risings in Galloway, Clydesdale, and Ayr. With their ministers and a few of the gentry at their head the Covenanters marched to Edinburgh, but were defeated at Rullion Green in the Pentlands by Dalziel, a Scottish officer whom Charles had recalled from the service of the czar. The executions which followed, and especially that of Hugh M'Kail, a young and enthusiastic preacher, sank deeply into the spirit of the people. He was the first martyr of the Covenant as Wishart had been of the Reformation. The use of torture, before this rare, now became frequent, and bonds of law-burrows were wrested from their original use to compel the principal landowners to be sureties for the peace of the whole district. Large fines continued to be extorted from all persons who refused to conform to the ecclesiastical laws. Next year a change in the Scottish administration, the cause of which is not well explained, but which was probably due to the fall of Clarendon and the rise of the Cabal ministry, led to a milder but undecided policy in Scotland. Lauderdale, one of the Cabal, still directed Scottish affairs, but Rothes and Sharp were treated as responsible for the rising in the west and suspended. An indemnity was offered to all who would appear before the council and subscribe bonds to keep the peace. A rash attempt to assassinate Sharp in Edinburgh prevented this policy from being adhered to in 1668; but it was renewed in the following year. An indulgence was granted which allowed the deposed ministers who had lived peaceably to return to their manse and glebes, and to receive such a stipend as the privy council might allow. The grace of this concession was undone by a severe Act against conventicles. It favoured a conciliatory policy that schemes for union were in the air. Leighton, the good bishop of Dunblane, proposed a union of the churches upon the basis that the bishops were no longer to exercise jurisdiction, but to act only as perpetual moderators of presbyteries, subject to censure by the synods, and that ministers should be ordained by the bishops, but with consent of the presbyters. There was a meeting at Holyrood with some of the leading ministers, but they would listen to no compromise. The name of bishop was hateful whatever were his functions. It may be doubted whether Charles and his English advisers would have submitted to a curtailment of the bishop's office and dignity. The subject of the union of the kingdoms was again brought forward in the parliament of 1669, to which Lauderdale was sent as commissioner; and though it was not well received commissioners were appointed in the following year, who went to London in autumn to discuss with English commissioners certain specified points proposed by the king. After several meetings the conference broke up in consequence of a demand by the Scottish members that Scotland should have the same number of members in the united as in its own parliament. The arbitrary government favoured by the want of a settled constitution in Scotland was more to the taste of the king and his advisers. Lauderdale openly boasted, as James VI. had done, that nothing could be proposed in the Scottish parliament except what the king through the Lords of the Articles approved. The "indulgence" entirely failed of the desired effect. The ministers who took advantage of

Policy of
indul-
gence.

it were despised by the people, who continued to attend the conventicles. In 1672 an Act was passed punishing preachers at such conventicles with death and imposing fines, imprisonment, and exile for having children baptized by deprived ministers and for absence for three Sundays from the parish church. In 1675 letters of intercommuning were issued against about a hundred of those who attended the conventicles, both ministers and laymen, forbidding their friends and relations to have any dealings with them under the same penalties as if they had themselves been present at the conventicles. In 1678 Mitchell, a fanatical preacher, who had ten years before attempted the life of Sharp and mortally wounded the bishop of Orkney, was tried and executed. The feeling of the times, and the cruel manner in which a confession had been wrung from him by torture, led to his being regarded as a martyr. Prior to this year 17,000 persons had suffered fines or imprisonment for attending conventicles. A host of 10,000 men, chiefly Highlanders, was quartered in the western shires in order to force the landowners who favoured the Covenanters to enter into bonds of law-burrows.

It appears to have been the design of Lauderdale, Rising of who still governed Scotland absolutely through the privy 1679. council (no parliament having been summoned since 1674), to force the Scots to rebel. "When I was once saying to him," relates Burnet, "'Was that a time to drive them into a rebellion?' 'Yes,' said he, 'would to God they would rebel that he might bring over an army of Irish Papists to cut their throats.'" One part of his wish was speedily fulfilled. In 1679 the rebellion so long smouldering broke out. The murder of Sharp (3d May) by Hackston of Rathillet and a small band of Covenanters was followed by a still more stringent proclamation against field conventicles, which were declared treasonable, and the possession of arms was prohibited. This severity provoked a rising in the west. A small party led by Hamilton, a youth educated by Bishop Burnet at Glasgow, who had joined the Covenanters, burnt at Rutherglen the statutes and acts of privy council on the anniversary of the Restoration, and being allowed to gather numbers defeated Graham of Claverhouse at Loudon Hill (1st June). The duke of Monmouth, the favourite natural son of Charles, sent with troops from England to suppress the rising, gained an easy victory at Bothwell Bridge (22d June). His desire was to follow it up by a policy of clemency, and a new indulgence was issued, but its effect was counteracted by Lauderdale. All officers, ministers, and landowners, as well as those who had taken part in the rising and did not surrender within a short space, were excepted from the indulgence. Several preachers were executed and many persons sent to the colonies, while fines and forfeitures multiplied. A new and fiercer phase of the rebellion was originated by Cargill and Cameron, two preachers who escaped at Bothwell Bridge, and, assembling their followers at Sanguhar, published a declaration renouncing allegiance to Charles as a perjured king. They were soon surprised and Cameron was killed, but Cargill continued to animate his followers, called the "Society Men" or "Cameronians," by his preaching, and at a conventicle at Torwood in Ayrshire excommunicated the king, the duke of York, Lauderdale, and Rothes.

The duke of York, who had become a Roman Catholic during his residence abroad, was now sent to Scotland, partly to avoid the discussion raised by his conversion as to his exclusion from the succession. During a short stay of three months he astonished the Scots by the mildness of his administration, but on his return in the following year he revealed his true character. The privy council renewed its proclamations against conventicles and increased the fines, which were levied by the sheriff or other magistrate under the pain of liability if they were remiss in their

Continu-
ance of
severities.

exaction. Military commissions were issued to Claverhouse and other officers in the southern and western shires empowering them to quarter their troops on recusants and administer martial law. Torture was freely resorted to by the privy council and the duke himself took pleasure in witnessing it. A parliament summoned in 1681, after passing a general Act against Popery to lull suspicion, proceeded to declare the succession to be in the ordinary line of blood and unalterable on account of difference of religion by any future law. The Test Act was then carried, not without many attempts to modify it. Its ambiguous and contradictory clauses make it an admirable instrument of tyranny, a shelter for the lax and a terror to the upright conscience. It was at once enforced, and Argyll, who declared he took it only so far as it was consistent with itself and the Protestant religion, was tried and condemned to death for treason, but escaped from prison to Holland. Dalrymple, the president of the Court of Session, and many leading Presbyterian ministers and gentry followed his example, and found a hospitable refuge in the republic which first acknowledged toleration in religion. They there met a similar band of English exiles. The next two years were spent in plots, of which the centre was in Holland, with branches in London and Edinburgh. The failure of the Rye House Plot in 1683 led to the execution of Russell and Sidney and the arrest of Spence, a retainer of Argyll, Carstares, Baillie of Jerviswood, and Campbell of Cessnock. Against Campbell the proof of complicity failed, and Spence and Carstares, though cruelly tortured, revealed nothing of moment. Baillie, however, was condemned and executed upon slender proof. The Cameronians, who kept alive in remote districts the spirit of rebellion, were treated with ruthless cruelty. Although doubt has been cast on the death of Brown the carrier, shot down in cold blood by Claverhouse, and the Wigtown martyrs, two poor women tied to a stake and drowned in the Bay of Luce, the account of Wodrow has, after a keen discussion, been sustained as accurate. The conduct of the Government in Scotland gained for this period the name of the "Killing Times."

Killing
Times.
James
VII.

The short reign of James VII. is the saddest period in the history of Scotland. He succeeded in the brief space of three years in fanning the revolutionary elements in both England and Scotland into a flame which he was powerless to quench. He declined to take the Scottish coronation oath, which contained a declaration in favour of the church then established. A submissive parliament held (28th April 1685) under the duke of Queensberry as commissioner not only overlooked this but expressed its loyalty in terms acknowledging the king's absolute supremacy. The excise was granted to the crown for ever and the land-tax to James for life. The law against conventicles was even extended to those held in houses, if five persons besides the family attended domestic worship; while, if the meeting was outside the house, at the door or windows, it was to be deemed a field conventicle, punishable by death. The class of persons subject to the test was enlarged. Undeterred or provoked by these terrors of the law, Argyll made a descent upon the western Highlands and tried to raise his clansmen, but, being badly supported by the officers under him, his troops were dispersed and he himself taken prisoner, when he was brought to Edinburgh, condemned, and executed under his former sentence. Next year Perth the lord chancellor, Melfort his brother, and the earl of Moray became converts to the Popish faith. The duke of Queensberry, who did not follow their example, was enabled only by the most servile submission in other points to the royal wishes to save himself and his party in the privy council from dismissal. James sent a letter to parliament offering free trade with England and an indemnity for political offences, in return for which it was required

that the Catholics should be released from the test and the penal laws. But the estates refused to be bribed. Even the Lords of the Articles declined to propose a repeal of the Test Act. The burghs almost for the first time in a Scottish parliament showed their independence. The refractory parliament was at once adjourned and soon after dissolved, and James had recourse in Scotland as in England to the dispensing power. Under a pretended prerogative he issued a proclamation through the privy council, granting a full indulgence to the Romanists, and by another deprived the burghs of the right of electing magistrates. A more limited toleration was granted to Quakers and Presbyterians, by which they were allowed to worship according to their consciences in private houses. This was followed by a second and a third indulgence, which at last gave full liberty of worship to the Presbyterians and was accepted by most of their ministers; but the laws against field conventicles continued to be enforced. In February 1688 Renwick was executed under them at Edinburgh. A band of his followers, including women and children, were marched north and imprisoned with great cruelty in Dunnottar.

Meantime the rapid series of events which led to the Revolution in England had reached its climax in the trial and acquittal of the seven bishops. William of Orange, who had long watched the progress of his father-in-law's tyranny, saw that the moment had come when almost all classes in England as well as Scotland would welcome him as a deliverer. But the Revolution was differently received in each part of the United Kingdom. In England there was practically no opposition; in Catholic Ireland it was established by force. Scotland was divided. The Catholics, chiefly in the Highlands, and the Episcopalians led by their bishops adhered to James and formed the Jacobite party, which kept up for half a century a struggle for the principle of legitimacy. The Presbyterians—probably the most numerous, certainly the most powerful party, especially in the Lowlands and burghs—supported the new settlement, which for the first time gave Scotland a constitutional or limited monarchy. Shortly before his flight James had summoned his Scottish troops to England; but Douglas, brother of the duke of Queensberry, their commander-in-chief, went over to William. Claverhouse, now Viscount Dundee, the second in command, who had the spirit of his kinsman Montrose, after in vain urging James to fight for his crown, returned to Scotland, followed by some thirty horsemen. In Edinburgh the duke of Gordon still held the castle for James, while the convention parliament, presided over by the duke of Hamilton, was debating on what terms the crown should be offered to William. Dundee passed through Edinburgh unmolested, and encouraged Gordon to hold out, while he himself gathered the Highland chiefs round his standard at Lochaber. Mackay, a favourite general of William, sent to oppose him, was defeated at Killiecrankie (27th July 1689), where the spirited leadership of Dundee and the dash of the Highlanders' attack gained the day; but success was turned into defeat by a bullet which killed Dundee almost at the moment of victory. No successor appeared to take his place and keep the chiefs of the clans together. The Cameronians, organized into a regiment under Cleland, repulsed Cannon, the commander of the Highland army, at Dunkeld, and the success of Livingston, who defeated the remnant under Cameron and Buchan at the Haughs of Cromdale on the Spey, ended the short and desultory war. The castle of Edinburgh had been surrendered a month before the battle of Killiecrankie. Three forts, at Fort William, Fort Augustus, and Inverness, sufficed to keep the Highlands from rising for the next two reigns.

Meantime the convention parliament in Edinburgh had

Revolution of
William
III.

Pacification of
the High-
lands.

1689-1705. carried the necessary measures for the transfer of the government of Scotland to William and Mary. It declared in bolder terms than the English parliament that James had forfeited the crown and that the throne was vacant. The fifteen articles which contained the reasons for this resolution were included in a Declaration and Claim of Right,—a parallel to the English Declaration and Bill of Rights. Besides the declarations against the Papists with which it commenced—that no Papist could be king or queen, that proclamations allowing mass to be said, Jesuit schools and colleges to be erected, and Popish books to be printed were contrary to law—it detailed each of the unconstitutional acts of James and pronounced it contrary to law. This formidable list included imposing oaths without the authority of parliament; grants without the consent of parliament; employing officers of the army as judges throughout the kingdom; imposing exorbitant fines; imprisoning persons without expressing the reason, and delaying trials; forfeiture upon insufficient grounds, especially that of Argyll; the nomination by the king of the magistrates of burghs; sending of royal letters to courts of justice with reference to pending cases; granting protections for debt; forcing the lieges to depone against themselves in capital crimes; the use of torture without evidence in ordinary crimes; quartering of an army in time of peace upon any part of the kingdom; the use of law-burrows at the king's instance; putting garrisons in private houses in time of peace without the consent of the owners and of parliament; and fining husbands for their wives. It closed with asserting that Prelacy and the superiority of any office in the church above presbyters were insupportable grievances and ought to be abolished, and that it was the right and privilege of subjects to protest to parliament for "remeid" of law and to petition the king, and that for redress of grievances it was necessary parliament should frequently be called, with freedom of speech secured to members. As a conclusion from these premises the estates resolved that William and Mary should be declared king and queen of Scotland during their lives, but with the right of exercising regal power in William alone as long as he lived. After their death the crown was to pass to the heirs of the queen's body, and failing her to Anne of Denmark and her heirs, failing whom to the heirs of William. Commissioners were despatched to London to present the declaration and statement of grievances and take the royal oath to the acceptance of the crown on their terms. This was done at Whitehall in the following March (1689); but William, before taking the oath, required an assurance that persecution for religious opinion was not intended and made a declaration in favour of toleration.

His government of Scotland.

By desire of William the convention was superseded by a parliament which met in June; but, with the exception of an Act abolishing Prelacy, it transacted no business of importance. The parliament of 1690 was more fruitful. It abolished the committee of the Articles, which had become an abuse inconsistent with the freedom of parliament, and, while it retained a committee on motions and overtures in its place, declared that the estates might deal with any matter without referring it to this committee. The Act of Supremacy was rescinded. The Presbyterian ministers deposed since 1661 were restored and the Westminster Confession approved, though not imposed as a test except on professors. With more difficulty a solution was found for the question of church government. The Presbyterian Church was re-established with the Confession as its formula, and patronage was placed in the heritors and elders with a small compensation to the patrons. These prudent measures were due to the influence of Carstairs, the chief adviser of William in Scottish ecclesiastical matters. He was not so well advised in the conduct of

the civil government by the master of Stair, who became sole secretary for Scotland. The proclamation for calling out the militia may have been a necessary precaution, but it raised much opposition amongst the landed gentry, and the militia was not then embodied. The massacre of the Glencoe. Macdonalds at Glencoe by Campbell of Glenlyon was contrary to the spirit of the indemnity offered to the Highlanders. While the treachery with which it was executed may be attributed to Glenlyon, it was too plainly proved before the committee of inquiry which the Scottish parliament insisted on that it had been designed by Stair and Breadalbane, and, now that the whole documents have been published, it is also proved that it had been sanctioned by William. It was intended to strike terror; but its partial success was dearly bought, for it kept alive the Jacobite disaffection and gained for it much sympathy. The unfair treatment of the Scots in the matters of free trade and navigation, in which the new Government appeared to follow the policy of Charles rather than that of Cromwell, and acted with an exclusive regard to the prejudices and supposed interests of England, reached a climax in the abandonment of the Scottish settlement at Darien when attacked by the Spaniards. The over-sanguine hopes of Paterson and the Scottish colonists and capitalists who supported his enterprise, so suddenly transformed into a financial disaster overwhelming to a poor country, accompanied by the loss of many lives, embittered the classes on which the Revolution settlement mainly depended for its support. It was the anxious wish of William to have effected the legislative union; but, although he twice attempted it, the last time a month before his death, the temper of the English parliament and of the Scottish people appeared to give small chance of its realization.

9. *The Union and its Consequences.*—The reign of Anne, Union of so far as it relates to Scotland, centred in the accomplishment of the union. In spite of the disparity of numbers, both nations now met to treat on equal terms. Still there were grave difficulties, and it required all the wisdom of the ministers of the early years of Anne, aided by the glory of Marlborough's arms, to overcome national prejudices and secure an object plainly for the benefit of both. The memories of Glencoe and Darien and the refusal of equal rights of trade led the Scottish parliament, the year after Anne's accession, to pass an Act of Security, by which, if the queen died without issue, the Scottish estates were to name a successor from the Protestant descendants of the royal line; but the successor to the English crown was expressly excluded unless there were "such conditions of government settled and enacted as may secure the honour and sovereignty of the crown and kingdom, the freedom, frequency, and power of parliament, the religious freedom and trade of the nation from English or any foreign influence." Political economy had not yet taught the reciprocal advantage of free trade, and the English jealousy of Scottish traders was intense. An incident about this time warned the English ministers that Scotland might easily revert to its old attitude of enmity. A Scottish ship of the African or Darien Company having been seized in the Thames at the suit of the English East India Company, the "Worcester," an English East Indiaman, was taken in the Forth by way of retaliation, and Green, its captain, with two other officers, was executed at Leith on a charge of piracy insufficiently proved. An attempt had been already made to complete the union by a commission, which sat from 10th November 1702 to 3d February 1705; but this miscarried through the refusal to grant free trade between the kingdoms. But again in 1705 the English parliament sanctioned the appointment of other commissioners, and new officers of state were nominated for Scotland with the express purpose of press-

ing the scheme forward in the Scottish parliament. Though opposed on contrary grounds by the Jacobites and the party of Fletcher of Salton, the Scottish ministry of Queensberry succeeded, by the aid of a third party nicknamed the "Squadron Volante," in getting the consent of parliament to the appointment of commissioners by the crown. The Act expressly excepted the church from the matters with which the commission was to deal. The commissioners, thirty-one from each country, met at Whitehall on 16th April and concluded their sittings on 23d July. The nomination by the crown had secured persons anxious to accomplish the union; experience had disclosed the cause of former failures, and the commissioners were guided by the statesmanship of Somers. It had been recognized from the first that the only settlement of the ecclesiastical question possible was to leave to each country its own church. It was wisely decided to treat the law and the courts in the same manner. These two subjects being removed from the scope of the treaty narrowed the debates to four main points,—the succession, trade, taxation, and the composition of the future parliament. The Scottish commissioners yielded on the first, the English on the second, and the remaining two were adjusted by a skilful compromise. The chief articles of the treaty were the settlement of both crowns according to the English Act of Succession on Anne and her descendants, and failing them on the electress Sophia and the Hanoverian line; the establishment of free trade between England and Scotland, and the admission of the Scots to equal privileges as regards trade with other countries; the national debt and taxation were adjusted by the imposition on Scotland of a moderate share (£48,000) of the land-tax, of which England was still to bear £200,000, and there was to be a uniform rate of custom and excise, Scotland being compensated by an equivalent of about £400,000 for becoming liable to a proportion of the English national debt, which already amounted to £16,000,000; forty-five representatives of Scotland were to be admitted to the House of Commons and sixteen elected peers to the House of Lords. Although the terms were on the whole favourable to Scotland, their announcement was received with dissatisfaction, especially in Edinburgh. The loss was immediate, from the abolition of an independent parliament, the reduction of the capital to a provincial town, and the increase of taxation to pay the growing national debt. The gain was in the future and in part doubtful. No one contemplated the rapid and enormous extension of trade. A proud people was unwilling to admit the advantage consequent upon free intercourse with a country in which wealth and civilization were more widespread. It had a natural attachment to its own institutions, though these were less popular than the English. It feared that, notwithstanding the most solemn guarantee, neither its church nor its laws could resist the influence of a country so much larger and more populous, in which henceforth was to be the sole seat of government, and that much of its wealth and talent would be attracted to the south and become English. The last parliament of Scotland was preceded by a stormy agitation against the union, and began its session with numerous addresses praying that the treaty should not be ratified, while none were presented in its favour. The popular feeling was embodied in the speeches of Lord Belhaven from a sentimental and patriotic point of view, and of Fletcher of Salton, who represented the democratic or republican element latent in a portion of the nation. But common sense aided by ministerial influence prevailed. The vote on the first article was prudently taken with a proviso that it was to be dependent on the rest being carried, but it really decided the fate of the measure. The Government commanded a large majority of the peers,

perhaps more amenable to influence. They were accused 1705-1709. by the Jacobites of being bribed, but the sums received in name of payment of arrears of pension and of debts were too small to justify the charge. The lesser barons or county members and the representatives of the burghs were nearly equally divided; but there was a majority of four of each of these estates in favour of the article. The whole estates voted together and the total majority was thirty-five. This was increased when the last vote was taken to 41, the numbers being 110 for and 69 against, and the Act of Ratification to take effect from 1st May 1707 was carried. The Presbyterian Church received an additional guarantee in an Act passed for "securing the Protestant religion and the Presbyterian Establishment."

In the English parliament there was less serious opposition, proceeding chiefly from the High Church party, which was conciliated by an Act for the security of the Church of England. On 6th March 1707 the Scottish and English Acts ratifying the union received the royal assent.

Two Acts of the British parliament naturally followed the Act of Union. The Scottish privy council was abolished in 1708. A secretary of state for Scotland continued until 1746 to manage the Scottish department in London; but the lord advocate, the adviser of the crown on all legal matters both in London and Edinburgh, gradually acquired a large, and after the suppression of the office of the Scottish secretary a paramount influence in purely Scottish affairs, though he was nominally a subordinate of the home secretary.¹ In 1709 the law of treason was assimilated to that of England, being made more definite and less liable to extension by construction in the criminal courts. In the later years of Anne, when after the fall of Marlborough power passed from the Whig to the Tory party, two statutes were passed of a different character. Patronage was restored in the Presbyterian Church notwithstanding the protests of the assembly, and proved a fertile source of discord. A limited toleration Act in favour of the Episcopalians, permitting them to worship in private chapels, was opposed by the Presbyterians but carried.

With the union of the parliaments Scotland lost its legislative independence. Its representation in the British parliament for more than a century, based on the freehold franchise in the counties and in the burghs controlled by town councils, which were close corporations, was a representation of special classes and interests rather than of the nation. It almost appeared as if the prophecy of Belhaven would be accomplished and there would be an end of an old song. But Scottish history was not destined yet to end. The character of the people, though their language and manners gradually became more like those of England, remained distinct. They retained a separate church and clergy. Independent courts and a more cosmopolitan system of law opened a liberal profession and afforded a liberal education to youthful ambition. A national system of parish schools, burgh schools, and universities, though inadequately endowed and far from reaching the ideal of Knox and Melville, gave opportunities to the lower as well as the higher classes of receiving at a small cost an education suited for practical uses and the business of everyday life. The Scot had been from the earliest times more inclined to travel, to migrate, to colonize than the Englishman, not that he had a less fervent love of home, but a soil comparatively poor made it necessary for many to seek their fortune abroad. This tendency which had led Scottish monks, soldiers, and professors to embrace foreign service, now found new openings in trade, commerce, colonial enterprise in America, the East, and the West Indies, in the southern hemisphere and the exploration of unknown parts

¹ In 1885 a secretary for Scotland was again appointed with a separate office at Dover House, London.

1709-1746 of the globe. Accustomed to poverty, Scottish emigrants acquired habits of frugality, industry, and perseverance, and were rewarded by success in most of their undertakings. Nor, if war be regarded as necessary to the continued existence of a nation, was it altogether absent, but the cause with which the name of Scotland became identified was the losing one. The two rebellions proved the devoted loyalty which still attached many of the Highland clans, the Catholics, and some of the Episcopalians to the descendants of the Stuarts. But that in 1715, preceded by an abortive attempt in 1708, was put down by a single battle; Sheriffmuir, if it could scarcely be claimed as a victory by Argyll, led to the speedy dispersal of the clans which had gathered round the standard of Mar. Thirty years later the romantic rising of the Highlanders under the Young Pretender found the Government unprepared. Once more for a brief space Holyrood was a royal court. The defeat of Cope at Prestonpans and the rapid march of the Scottish army, slightly reinforced by Catholics from the northern and midland shires of England, to Derby, by which it cut off the duke of Cumberland's forces from the capital, made London tremble. Divided counsels, the absence of any able leader, and the smallness of their number (not more than 5000) prevented the daring policy of attacking London, which Charles himself favoured, and a retreat was determined on. It was skilfully effected, and on 26th December the little army, which had left Edinburgh on 31st October and reached Derby on 4th December, arrived in Glasgow. It was not favourably received, the south-west of Scotland being the district least inclined to the Stuarts, and it marched on Stirling to assist Lord John Drummond and Lord Strathallan, who had commenced its siege, which General Hawley threatened to raise. His defeat at Falkirk was the last success of the Jacobites. The duke of Cumberland was sent to command the royal forces, and Charles Edward was forced by Lord George Murray and the Highland chiefs to abandon the siege of Stirling and retreat to Inverness. He was at once pursued by the duke, and his defeat at Culloden (16th April 1746) scattered his followers and compelled him to seek safety in flight to the Hebrides, from which, after five months' wanderings, he escaped to France. The last rebellion within Great Britain was put down with severity. Many soldiers taken in arms were shot and no consideration was shown to the wounded. The chief officers and even some privates taken prisoners were tried and executed at various places in the north of England. The earls of Cromarty and Kilmarnock and Lord Balmerino were reserved for the judgment of their peers in London, and having pleaded guilty were beheaded at Tower Hill. The crafty Lovat, who had avoided appearing in arms, but was really at the bottom of the rising, though he pretended to serve both sides, was the last to suffer. An Act of indemnity was passed a few weeks after his execution. But effective measures were taken to prevent any renewal of the rebellion. The estates and titles of all who had been privy to it were forfeited. An Act was passed prohibiting the use of arms and the Highland dress; and the abolition of the military tenure of ward-holding, unfortunately preserved at the union, rooted out the remnants of feudal and military power till then left in the hands of the nobles and chiefs. These changes in the law had the willing consent of the Lowland and burghal population in Scotland, to whom the lawless and freebooting habits of the Highlanders had been a cause of frequent loss and constant alarm. Somewhat later the masterly policy of Pitt enlisted the Scottish Celts in the service of the crown by forming the Highland regiments. The recollection of Glencoe and Culloden was forgotten after the common victories of the British arms in India, the Peninsula, and Waterloo. In one direction the Jacobite cause survived

Jacobite
rebel-
lions.

its defeat. Poetry seized on its romantic incidents, idealized the young prince who at least tried to win his father's crown, satirized the foreign and German, the Whig and Covenanting, elements opposed to the Stuart restoration, and substituted loyalty for patriotism. Self-sacrifice and devotion to a cause believed right, though deserted by fortune (qualities rare amongst the mass of any nation), dignified the Jacobites like the cavaliers with some of the nobler traits of chivalry, and the Jacobite ballads have their place in literature as one of the last expiring notes of mediæval romance. Music and tradition fortunately preserved their charm before the cold hand of history traced the sad end of Charles Edward, the pensioner of foreign courts, wasting his declining years in ignoble pleasures. It might be hard to say whether the first Hanoverians or the last Stuarts least deserved that men should fight and die for them; but the former represented order, progress, civil and religious liberty; the latter were identified with the decaying legend of the divine right of kings and the claim of the Roman Church not merely to exclusive orthodoxy but to temporal power and jurisdiction inconsistent with the independence of nations and freedom of conscience. Although a larger minority in Scotland than in England clung to the traditions of the past, an overwhelming majority of the nation, including all its progressive elements, were in favour of the new constitution and the change of dynasty.

During the remaining half of the 18th century and the commencement of the 19th a period of prosperity was enjoyed by Scotland, during and the good effects of the union, intercepted by the rebellions, 19th century became visible. The Scottish nation, without losing its individuality, was stimulated by contact and friendly rivalry with its English neighbour in the arts of peace. It advanced in intellectual as well as material respects more than in any part of its previous history. It became, through commerce, manufactures, and improved agriculture, a comparatively rich instead of a poor country. Skilful engineering made the Clyde a successful competitor with the Thames and the Mersey, and Glasgow became one of the most populous cities in Great Britain. The industrial arts made rapid progress, and the fine arts began to flourish. The art of saving capital and using it as a source of credit was reduced to a system. Banks, not unknown in other countries and at an earlier date, are in their modern form a Scottish invention. Besides those which sprang up in Scotland itself, the national banks of England and France owed their origin to two Scotsmen. A safe system of life insurance represented the provident habits and business talents of the nation. Adam Smith shares with the French economists the honour of founding political economy as the science of the wealth of nations. Mental philosophy became a favourite study, and a distinctively Scottish school produced thinkers who deeply influenced the later systems of the Continent. The history not of Scotland only but of England and some portions of that of Europe were written by Scotsmen in works equal to any existing before Gibbon. The dawn of the scientific era of the 19th century was foreshadowed by Scottish men of science, the founders of modern geology, chemistry, anatomy, physiology, and the practice of medicine. In Scotland was made the first of the great line of discoveries in the practical application of science by the use of steam as a motive-power. The same period—so varied were its talents—gave birth to two Scottish poets, of world-wide fame. Burns expressed the feelings and aspirations of the people; Scott described both in verse and prose their history and the picturesque scenes in which it had been transacted. During the last half-century the material progress continued, but the intellectual was too brilliant to last. The preponderating influence of England even threatened to extinguish native Scottish genius by centralizing the political and social life of the island in the English capital. Only two changes of importance occurred. The political institutions of Scotland were reformed by a series of Acts which placed the franchise on a broader basis and made the representation of the people real. The Established Church, already weakened by secessions, was further divided by a disruption largely due to the ignorance of political leaders as to the deep-seated aversion of the nation to any interference with the independence of the church, especially in matters of patronage. Educational reform has also in recent years raised the standard of the universities and schools without injuring their popular character. While it would be incorrect to say that Scotland has had no independent history since the union, that history must be chiefly read in the annals of its church, its law, and its literature. Its political existence has been absorbed in that of Great Britain. (Æ. M.)

PART II.—PHYSICAL FEATURES.

Plate
VII.

Scotland forms the northern portion of Great Britain and is divided from England by the rivers Sark, Liddell, and Kershope (an affluent of the Liddell), the Cheviot Hills, the river Tweed, and the liberties of Berwick. The mainland lies between $58^{\circ} 40' 30''$ (at Dunnet Head, Caithness) and $54^{\circ} 38' N.$ lat. (Mull of Galloway) and $1^{\circ} 45' 30''$ (Peterhead) and $6^{\circ} 14' W.$ long. (Arduamurchan Point, Argyllshire). Including the islands, the extreme N. lat. is $60^{\circ} 51' 30''$ (Outsack, Shetland) and the extreme W. long. $8^{\circ} 35' 30''$ (St Kilda). Its greatest length from north to south, from Durness in Sutherland to Burrow Head in Wigtownshire, is 272 miles, and the greatest breadth from east to west, from Peterhead in Aberdeenshire to Applecross in Ross-shire, is 155, while the narrowest part, from Grangemouth in Stirlingshire to Bowling in Dumbartonshire, is only $30\frac{1}{2}$ miles wide. The total area in 1881, according to the Ordnance Survey, was 19,777,490 acres or 30,902 square miles, —the area of foreshore being 310,413 acres or 485 square miles, of water 403,846 acres or 631 square miles, and of land-surface 19,063,231 acres or 29,786 square miles. But of the water area the acreage included under lakes and rivers respectively has not been ascertained.

GEOLOGY.

In the article GEOLOGY (vol. x.) descriptions will be found of most of the geological formations of Scotland. All that need therefore be inserted here is a succinct summary of these formations with references to the pages of that article where fuller details are given.

Archæan
rocks.

The oldest rocks of Scotland and of the British Islands, known as Archæan, consist chiefly of gneiss (Fundamental, Lewisian, Hebridian), which varies from a coarsely crystalline granitoid mass to fine schist. The coarse varieties are most abundant, intermingled with bands of hornblende-rock, hornblende-schist, pegmatite, eurite, mica-schist, sericite-schist, and other schistose accompaniments. In a few places limestone has been observed. No trace of any organism has ever been detected in any of these rocks. Over wide areas, particularly on the mainland, the bands of gneiss have a general north-west trend and undulate in frequent plications with variable inclination to north-east and south-west. The largest tract of Archæan rock is that which forms almost the whole of the Outer Hebrides, from Barra Head to the Butt of Lewis. Other areas more or less widely separated from each other run down the western parts of Sutherland and Ross, and are probably continued at least as far as the Island of Rum. How far Archæan rocks reappear to the east of this western belt has not yet been ascertained.

Cam-
brian
sand-
stone.

Above the Archæan gneiss lies a series of red and chocolate-coloured sandstones, conglomerates, and breccias (Cambrian or Torridon sandstone), which form a number of detached areas from Cape Wrath down the seaboard of Sutherland and Ross, across Skye, and as far as the Island of Rum (GEOLOGY, vol. x. p. 330). They rise into prominent pyramidal mountains, which, as the stratification is usually almost horizontal, present in their terraced sides a singular contrast to the neighbouring heights, composed of highly plicated crystalline schists. In the Torridon district these sandstones can be seen towering bed above bed to a height of about 4000 feet, and their thickness is still greater. They have not yet yielded any recognizable fossil; their geological age is accordingly doubtful, though from their relation to the overlying fossiliferous rocks and from their own lithological characters they have with much probability been classed with the Cambrian system of Wales. They are not met with anywhere else in Scotland than in the north-west Highlands.

Silurian
system.

Rocks belonging to the Silurian system occur in two distinct regions and in two very strongly contrasted conditions. They constitute nearly the whole of the southern uplands (GEOLOGY, vol. x. pp. 333, 337). In that belt of country they consist for the most part of greywacke, grit, shale, and other sedimentary rocks, but in the south-west of Ayrshire they include some thick lenticular bands of limestone. They have been thrown into many plications, the long axes of which run in a general north-easterly direction. It is this structure which has determined the trend of the southern uplands. The plications of the Highlands and the chief dislocations of the country have followed the same general direction, and hence the parallelism and north-easterly trend of the main topographical features. Abundant fossils in certain parts of the Silurian rocks have shown that representatives of both the Lower and Upper divisions are present. By far the larger part of the uplands belongs to the former. The Upper Silurian shales and sandstones appear only along the northern and southern margins.

In the north-west Highlands the Cambrian red sandstones are overlain unconformably by several hundred feet of white quartzite with annelid tubes, followed by fossiliferous limestones and shales (GEOLOGY, vol. x. p. 333). The abundant fossils in these strata prove them to be of Lower Silurian age. It was believed by Murchison that, as these Silurian strata dip conformably below various schists which spread eastwards into the rest of the Highlands, they demonstrate the crystalline rocks of the Highlands to

be of later than Silurian age. Recently, however, the structure of Sutherland has been investigated anew with minute care and the result is to show that the schists believed to overlie the Silurian strata conformably have been really pushed over them and consist in part of the Archæan gneiss. It has been ascertained that from the mouth of Loch Erriboll on the north coast of Sutherland southwards to the Isle of Skye, a distance of more than 100 miles, a gigantic system of earth-movements has taken place, whereby the Silurian, Cambrian, and Archæan rocks have been crumpled, inverted, dislocated, and have pushed over each other. In some places the horizontal displacement of these shifted masses has been not less than 10 miles. So intense has been the shearing of the rocks that their original structure has in many places been entirely destroyed. They have acquired a new schistosity, which is in a general sense parallel with the bedding of the Silurian rocks to the west of the line of disturbance. Hence the apparent conformability of the schists overlying these rocks. The total thickness of recognizable Silurian strata is about 2000 feet. The rocks that overlie them to the east of the line of disturbance in Sutherland and Ross are fine flaggy schists, quite unlike any part of the Archæan gneiss and often strangely suggestive of altered sandstones. What are their true age and history remains still to be determined. There can be no doubt, however, that they have acquired their present schistosity since the Lower Silurian period, and hence that the present condition of the metamorphic rocks of the central Highlands does not go back to Archæan time. That portions of the Archæan series may have been pushed up in different parts of the Highlands is quite conceivable. But that much of the Highlands consists of altered sedimentary rocks like those of the Silurian uplands admits of no question. The solution of this difficult but interesting problem has the most important bearing upon the theory of metamorphism, but it can only be attained by patient and laborious mapping of the ground such as is being prosecuted by the Geological Survey.

As Scotland is the typical European region for the Old Red Sandstone a full account of this series of rocks has already been given in the article GEOLOGY (vol. x. pp. 343, 344). These rocks are grouped in two divisions, Lower and Upper, both of which appear to have been deposited in lakes. The Lower, with its abundant intercalated lavas and tuffs, extends continuously as a broad belt along the northern margin of the midland valley, reappears in detached tracts along the southern border, is found again on the south side of the uplands in Berwickshire and the Cheviot Hills, occupies a tract of Lorne in Argyllshire, and on the north side of the Highlands underlies most of the low ground on both sides of the Moray Firth, stretches across Caithness and through nearly the whole of the Orkney Islands, and is prolonged into Shetland. The Upper Old Red Sandstone covers a more restricted space in most of the areas just mentioned, its chief development being on the flanks of the north-eastern part of the southern uplands, where it spreads out over the Lammermuir Hills and the valleys of Berwickshire and Roxburghshire.

The areas occupied by Carboniferous rocks are almost entirely Carboniferous, restricted to the midland valley, but they are also to be found skirting the southern uplands from the mouth of the Tweed to that of the Nith. The subdivisions of this important system, its coal-fields and igneous rocks, have been described in the article GEOLOGY (vol. x. pp. 346, 348, 349).

Rocks assignable to the Permian system occupy only a few small Permian areas in Scotland. Extending from Cumberland under the Solway Firth, they fill up the valley of the Nith for a few miles north of Dumfries, and, reappearing again in the same valley a little farther north, run up the narrow valley of the Carron Water to the Lowther Hills. Other detached tracts of similar rocks cover a considerable space in Annandale, one of them ascending the deep defile at the head of that valley. Another isolated patch occurs among the Lead Hills; and lastly, a considerable space in the heart of the Ayrshire coal-field is occupied by Permian rocks. Throughout these separate basins the prevailing rock is a red sandstone, varied in the narrow valleys with intercalated masses of breccia (GEOLOGY, vol. x. p. 351). There can be no doubt that the valleys in which these patches of red rocks lie already existed in Permian time. They seem then to have been occupied by small lakes or inlets, not unlike fjords. Numerous amphibian tracks have been found in the red sandstone of Annandale and also near Dumfries, but no other traces of the life of the time. One of the most interesting features of the Scottish development of the Permian system is the occurrence of intercalated bands of contemporaneously erupted volcanic rocks in the Carron Water, Nithsdale, and Ayrshire. The actual vents which were the sites of the small volcanoes still remain distinct, and the erupted lavas form high ground in the middle of Ayrshire.

The Triassic system appears to be only feebly represented in Scotland. To this division of the geological record are assigned the yellow sandstones of Elgin, which have yielded remains of rep-

tiles, but which at the same time cannot be satisfactorily separated from similar underlying strata which contain Upper Old Red Sandstone fishes. There occur also below the Lias on some parts of the west coast unfossiliferous red sandstones, conglomerates, and breccias which may possibly belong to the same system. These rocks attain their greatest thickness at Gruinard Bay on the west coast of Ross, where they must be several hundred feet thick. On the east side of the country, where so many fragments of the Secondary rocks occur as boulders in the glacial deposits, a large mass of strata was formerly exposed at Linksfield near Elgin containing fossils which appear to show it to belong to the Rhætic beds at the top of the Trias. But it was not in place, and was almost certainly a mass transported by ice. Rhætic strata no doubt exist *in situ* at no great distance under the North Sea.

Jurassic. The Jurassic system is well represented on both sides of the Highlands. Along the east coast of Sutherland good sections are exposed showing the succession of strata. Among these the Lower and Middle Lias can be identified by their fossils. The Lower Oolite is distinguished by the occurrence in it of some coal-seams, one of which, $\frac{3}{4}$ feet in thickness, has been worked at Brora. The Middle Oolite consists mostly of sandstones with bands of shale and limestones and includes fossils which indicate the English horizons from the Kellaways Rock up to the Coral Rag. The lower part of the Kimmeridge Clay is probably represented by sandstones and conglomerates, forming the highest beds of the series in Sutherland. On the west side of the Highlands Jurassic rocks are found in many detached areas from the Shiant Isles to the southern shores of Mull. Over much of this region they owe their preservation in great measure to the mass of lavas poured over them in Tertiary time. They have been uncovered, indeed, only at a comparatively recent geological date. They comprise a consecutive series of deposits from the bottom of the Lias up to the Oxford Clay. The Lower Middle and Upper Lias consist chiefly of shales and shelly limestones, with some sandstones, well seen along the shores of Broadford Bay in Skye and in some of the adjacent islands. The Lower Oolites are made up of sandstones and shales with some limestones, and are overlaid by several hundred feet of an estuarine series of deposits consisting chiefly of thick white sandstones, below and above which lie shales and shelly limestones. These rocks form a prominent feature underneath the basalt terraces of the east side of Skye, Raasay, and Eigg. They form the highest members of the Jurassic series, representing probably some part of the Oxford clay. The next Secondary rocks (Cretaceous) succeed them unconformably.

Cretaceous. Rocks belonging to the Cretaceous system undoubtedly at one time covered considerable areas on both sides of the Highlands, but they have been entirely stripped off the eastern side, while on the western they have been reduced to a few fragmentary patches, which have no doubt survived because of the overlying sheets of basalt that have protected them. Some greenish sandstones containing recognizable and characteristic fossils are the equivalents of the Upper Greensand of the south of England. These rocks are found on the south and west coasts of Mull and on the west coast of Argyllshire. They are covered by white sandstones and these by white chalk and marly beds, which represent the Upper Chalk of England. Enormous numbers of flints and also less abundant fragments of chalk are found in glacial deposits bordering the Moray Firth. These transported relics show that the Chalk must once have been in place at no great distance, if indeed it did not actually occupy part of Aberdeenshire and the neighbouring counties.

Basaltic plateaus. Above the highest Secondary rocks on the west coast come terraced plateaus of basalt, which spread out over wide areas in Skye, Eigg, Mull, and Morven, and form most of the smaller islets of the chain of the Inner Hebrides (GEOLOGY, vol. x. p. 362). These plateaus are composed of nearly horizontal sheets of basalt—columnar, amorphous, or amygdaloidal—which in Mull attain a thickness of more than 3000 feet. They are prolonged southwards into Antrim (Ireland), where similar basalts overlying Secondary strata cover a large territory. Occasional beds of tuff are intercalated among these lavas, and likewise seams of fine clay or shale which have preserved the remains of numerous land-plants. The presence of these fossils indicates that the eruptions were subaerial, and a comparison of them with those elsewhere found among older Tertiary strata shows that they probably belong to what is now called the Oligocene stage of the Tertiary series of formations, and therefore that the basalt eruptions took place in early Tertiary time. The volcanic episode to which these plateaus owe their origin was one of the most important in the geological history of Great Britain. It appears to have resembled in its main features those remarkable outpourings of basalt which have deluged so many thousand square miles of the western territories of the United States. The eruptions were connected with innumerable fissures up which the basalt rose and from numerous points on which it flowed out at the surface. These fissures with the basalt that solidified in them now form the vast assemblage of dykes which cross Scotland, the north of England, and the north of Ireland (GEOLOGY, vol. x. p. 312). That the

volcanic period was a prolonged one is shown by the great denudation of the plateaus before the last eruptions took place. In the Isle of Eigg, for example, the basalts had already been deeply eroded by river-action and into the river-course a current of glassy lava (pitchstone) flowed. Denudation has continued active ever since, and now, owing to greater hardness and consequent power of resistance, the glassy lava stands up as the prominent and picturesque ridge of the Scuir, while the basalts which formerly rose high above it have been worn down into terraced declivities that slope away from it to the sea. A remarkable feature in the volcanic phenomena was the disruption of the basaltic plateaus by large bosses of gabbro and of various granitoid rocks. These intrusive masses now tower into conspicuous groups of hills,—the Coolins in Skye, the mountains of Rum and Mull, and the rugged heights of Ardnamurchan.

Under the Post-tertiary division come the records of the Ice Age, Youngest when Scotland was buried under sheets of ice which ground down, formastriated, and polished the harder rocks over the whole country and tions, left behind them the widespread accumulations of clay, gravel, and sand known as glacial deposits. The nature of the evidence and the deductions drawn from it have been already stated (GEOLOGY, vol. x. pp. 365-368). The youngest geological formations are the raised beaches, river-terraces, lake-deposits, peat-mosses, and other accumulations, which are related to the present configuration of the country and contain remains of the plants and animals still living on its surface (GEOLOGY, vol. x. pp. 256, 290, 369).

PHYSICAL FEATURES.

The physical features of Scotland may be best realized by regarding the country as composed of three distinct belts of territory, differing from each other in their geological structure and consequently presenting striking contrasts in their scenery.

1. The Highlands, for convenience of description, are here regarded as embracing all that part of the country which lies west High- and north of a line drawn along the Firth of Clyde, and thence lands, diagonally in a north-easterly direction from the mouth of the river Clyde to the east coast at Stonehaven. Nearly the whole of this region is high ground, deeply trenched with valleys and penetrated by long arms of the sea. The only considerable area of lowland lies in the north-eastern counties, embracing the eastern part of Aberdeenshire and the northern parts of Banff, Elgin, and Nairn. Along both sides of the Moray Firth a strip of lower land intervenes between the foot of the hills and the sea, while farther north the county of Caithness is one wide plain, which is prolonged into the Orkney Islands. Seen from beyond its southern margin, the area of the Highlands presents a well-defined chain of hills, which rise abruptly from the plains of the Lowlands. This is best observed in Strathmore, but it is also conspicuous in the estuary of the Clyde, where the low hills on the south contrast well with the broken line of rugged mountains to the north. From any of the islands of the chain of the Inner Hebrides the Highlands along their western seaf- front rise as a vast rampart, indented by many winding fjords and rising up to a singularly uniform general level, which sinks here and there and allows glimpses to be had of still higher summits in the interior. The northern margin is hardly less striking when looked at from the Moray Firth, or from the plains of Caithness or Orkney.

From a commanding summit in the interior the Highlands are High- seen to differ from a mountain chain such as the Alps, not merely land in their inferior elevation, but essentially in their configuration and moun- structure. They are made up of a succession of more or less nearly tains, parallel confluent ridges, which have, on the whole, a trend from north-east to south-west. These ridges are separated by longitudinal valleys, and each of them is likewise furrowed by transverse valleys. The portions of ridge thus isolated rise into what are termed mountains. But all the loftier eminences in the Highlands are only higher parts of ridges along which their geological structure is prolonged. It is singular to observe how the general average of level of the summits of the ridges is maintained. From some points of view a mountain may appear to tower above all the surrounding country, but, looked at from a sufficient distance to take in its environment, it may be found not to rise much above the general uniformity of elevation. There are no gigantic dominant masses that must obviously be due to some special terrestrial disturbance. A few apparent exceptions to this statement rise along the western seaboard of Sutherland, in Skye, and elsewhere, but an examination of their structure at once explains the reason of their prominence and confirms the rule.

The general surface of the Highlands is rugged. The rocks pro- Surface- ject in innumerable bosses and crags, which roughen the sides and of High- crests of the ridges. The forms and colours of these roughnesses lands, depend on the nature of the rock underneath. Where the latter is hard and jointed, weathering into large quadrangular blocks, the hills are more especially distinguished for the gnarled bossy character of their declivities, as may be seen in Ben Ledi and the chain of heights to the north-east of it formed of massive grits and mica-schists. Where, on the other hand, the rock decays into smaller débris, the hills are apt to assume smoother contours, as in

the slate hills that run from the Kyles of Bute to Loch Lomond. Wherever any mass of rock occurs differing much from those around it in its power of resisting decomposition it affects the scenery, rising into a prominence where it is durable, or sinking into lower ground where it is not. This relation between relative destructibility and external configuration is traceable in every part of Scotland, and indeed may be regarded as the law that has mainly determined the present topography of the country.

Two regions of Highlands. The Highlands are separated into two completely disconnected and in some respects contrasted regions by the remarkable line of the Great Glen, which runs from Loch Linnhe to Inverness. In the northern portion the highest ground rises along the west coast, mounting steeply from the sea to an average height of perhaps between 2000 and 3000 feet. The watershed consequently keeps close to the Atlantic seaboard, indeed in some places it is not more than a mile and a half distant from the beach. From these heights, which catch the first downpour of the western rains, the ground falls eastwards, but with numerous heights that prolong the mountainous character, to the edge of the North Sea and the line of the Great Glen. The best conception of the difference in the general level on the two sides of the watershed may be obtained by observing the contrast between the lengths of their streams. On the western side the drainage is poured into the Atlantic Ocean after flowing only a few miles, while on the eastern side it has to run at least 30 or 40. At the head of Loch Nevis the western stream is only 3 miles long; that which starts from the eastern side has a course of some 18 to the Great Glen. Throughout the northern or north-western region a general uniformity of feature characterizes the scenery, betokening even at a distance the general monotony in the structure of the underlying schists. But the sameness is relieved along the western coast of Sutherland and Ross by singular groups of cones and stacks (to be afterwards referred to), and farther south by the terraced plateaus and abrupt conical hills of Skye, Rum, and Mull. The valleys run for the most part in a north-west and south-east direction, and this is also generally true of the sea lochs.

The south-eastern region of the Highlands, being more diversified in geological structure, presents greater contrasts of scenery. In the first place, its valleys chiefly run in a south-west and north-east direction and so also do most of the lakes and sea lochs. This feature is strikingly exhibited in the western part of Argyllshire. But there are also numerous and important transverse valleys, of which that of the Garry and Tay is the most conspicuous example. Again, the watershed in this region is arranged somewhat differently. It first strikes eastward round the head of Loch Laggan and then swings southward, pursuing a sinuous course till it emerges from the Highlands on the east side of Loch Lomond. But the streams flowing westward are still short, while those that run north-east and east have long courses and drain wide tracts of high ground. The Tay in particular pours a larger body of water into the sea than any other river in Great Britain. Moreover, the occurrence of many bosses of granite and other eruptive rocks gives rise to various interruptions in the monotonous scenery of the crystalline schists which constitute the greater part of the country. But a marked contrast may be traced between the configuration of the north-eastern district and the other parts of this region. In that area the Grampians rise into wide flat-topped heights or elevated moors often over 3000 and sometimes exceeding 4000 feet in height and bounded by steep declivities or not infrequently by precipices. Seen from an eminence on their surface, these plateaus look like fragments of an original broad tableland, which has been trenched into segments by the formation of the transverse and longitudinal valleys. Farther to the south-west in Perthshire, Inverness-shire, and Argyllshire, they give place to the ordinary hummocky crested ridges of Highland scenery, some summits on which, however, exceed 4000 feet in elevation. For the probable meaning of this transition from broad flat-topped heights to narrow crests and isolated peaks, see below (pp. 525-526).

Besides the principal tracts of low ground in the Highlands already referred to, there occur numerous long but narrow strips of flat land in the more important valleys. Each strath and glen is usually provided with a floor of detritus which, spread out between the bases of the bounding hills, has been levelled into meadow-land by the rivers, and furnishes as a rule the only arable ground in each district.

Southern uplands. 2. The southern uplands form the most southerly of the three transverse belts in Scottish topography. Extending from St Patrick's Channel to St Abb's Head, they constitute a well-defined belt of hilly ground, but present a striking contrast to the scenery of the Highlands. The rocks which underlie them consist almost wholly of Silurian grits, greywackes, and shales, which have been greatly plicated, the general axis of the folds running parallel with that of the whole belt, or from south-west to north-east. These uplands, though much less elevated than the Highlands (their highest point is not more than 2764 feet above the sea), rise with scarcely less abruptness above the lower tracts that bound them. Their north-western margin for the most part springs boldly above

the fields and moorlands of the midland valley, and its boundary for long distances continues remarkably straight. Their southern and south eastern limits are in general less prominently defined, except to the west of the Nith, where they plunge into the sea. Between the Solway Firth and the Cheviot Hills they pass under a line of high and picturesque escarpments which runs from Birrenswark in a north-east direction. In Berwickshire, however, they again tower boldly above the plain of the Merse. These uplands are distinguished above all by the smoothness of their surface. They may be regarded as a rolling tableland or moorland, traversed by innumerable valleys which with gentle verdant declivities conduct the drainage to the sea. This character is impressively seen from the heights of Tweedsmuir. Wide mossy moors, lying 2000 feet or more above the sea and sometimes level as a racecourse, spread out on all sides. Their continuity, however, is interrupted by numerous intervening valleys which separate them into detached flat-topped hills. Unlike the Highlands, these southern heights comparatively seldom present precipices of naked rock. Where the rock projects it more usually appears in low crags and knolls, from which long trails of grey or purple débris descend the slopes till they are lost among the grass. Hence, besides being smooth, the uplands are pre-eminently verdant. They form indeed excellent pasture-land, while the alluvial flats in the valleys and even some of the lower slopes of the hills are fitted for corn and green crops.

This uniformity of external aspect is doubtless traceable to the prevalence of the same kind of rocks and the same geological structure. The Silurian greywackes and shales that underlie almost logical the whole of these uplands weather generally into small angular structure. débris, and at a tolerably uniform rate of disintegration. But slight differences may readily be detected even where no feature interferes in a marked way with the general monotony. The bands of massive grit and coarse greywacke, for example, break up into larger blocks and from their greater hardness are apt to project above the general surface of the other and softer rocks. Hence their line of trend, which like that of all the other strata is in a north-easterly direction, may be followed from hill to hill even at a distance by their more craggy contours. Only in the higher tracts of these uplands are any rugged features to be seen that remind one of the more savage character of Highland scenery. In the heights of Hartfell (2651 feet) and Whitecomb (2695), whence the Clyde, Tweed, Annan, and Moffat Water descend, the high moorlands have been scarped into gloomy corries, with crags and talus-slopes, which form a series of landscapes all the more striking from the abrupt and unexpected contrast they present to everything around them. In Galloway, also, the highest portions of the uplands have acquired a ruggedness and wildness more like those of the Highlands than any other district in the south of Scotland. For this, however, there is an obvious geological reason. In that region the Silurian rocks have been invaded by large bosses of granite and have undergone a variable amount of metamorphism which has in some places altered them into hard crystalline schists. These various rocky masses, presenting great differences in their powers of resisting decay, have yielded unequally to disintegration: the harder portions project in rocky knolls, crags, and cliffs, while the softer parts have been worn down into more flowing outlines. The highest summit in the south of Scotland—Merrick (2764 feet)—consists of Silurian strata much altered by proximity to the granite, while the rest of the more prominent heights (all in Kirkcudbrightshire)—Rinn of Kells (2668 feet), Cairnmore of Carsphairn (2612), and Cairnmore of Fleet (2331)—are formed of granite.

The watershed of the southern uplands is of much interest in relation to their geological history. It runs from the mouth of Loch Ryan in a sinuous north-easterly direction, keeping near the southern northern limit of the region till it reaches the basin of the Nith, uplands. where it quits the uplands altogether, descends into the lowlands of Ayrshire, and, after circling round the headwaters of the Nith, strikes south-eastwards across half the breadth of the uplands, then sweeps north and eastwards between the basins of the Clyde, Tweed, and Annan, and then through the moors that surround the sources of the Ettrick, Teviot, and Jed, into the Cheviot Hills. Here again the longest slope is on the east side, where the Tweed bears the whole drainage of that side into the sea. Although the rocks throughout the southern uplands have a persistent north-east and south-west strike, and though this trend is apparent in the bands of more rugged hills that mark the outcrop of hard grits and greywackes, nevertheless geological structure has been much less effective in determining the lines of ridge and valley than in the Highlands. On the southern side of the watershed, in Dumfriesshire and Galloway, the valleys run generally transversely from north-west to south-east. But in the eastern half of the uplands the valleys do not appear to have any relation to the geological structure of the ground underneath.

3. Between the two belts of high ground lie the broad lowlands Central of central Scotland, or the midland valley, bounded on the north lowlands. side by the range of heights that extends from the mouth of the

Clyde to Stonehaven, on the south side by the pastoral uplands that stretch from Girvan to Dunbar. The simplest conception of the general aspect and structure of this important part of the kingdom is obtained by regarding it as a long trough of younger rocks let down by parallel dislocations between the older masses of the high grounds to the south and north. The lowest of these younger rocks are the various sedimentary and volcanic members of the Old Red Sandstone. These are covered by the successive formations of the Carboniferous system. The total thickness of both these groups of rock cannot be less than 30,000 feet, and, as most of them bear evidence of having been deposited in shallow water, it is manifest that they could only have been accumulated during a prolonged period of depression. The question arises whether this depression affected only the area of the midland valley itself, or whether it extended also over the regions to the north and south. Materials do not yet exist for a definite answer to this question; but so far as the evidence now before us goes there is ground for the inference that, while the depression had its maximum along the line of the lowlands, it also involved some portion at least of the high grounds on either side. In other words, the Old Red Sandstone and Carboniferous rocks, though chiefly accumulated in the broad lowland valley, crept also over some part at least of the hills on either side, where a few outliers are left to tell of their former extension. The central Lowlands of Scotland are thus of great geological antiquity. During and since the deposition of the rocks that underlie them the tract has been the scene of repeated terrestrial disturbances. Long dislocations, running like the ridges of the Highlands and the southern uplands from south-west to north-east, have sharply defined its northern and southern margins. By other fractures and unequal movements of upheaval or depression portions of the older rocks have been brought up within the bounds of the younger, and areas of the younger have been enclosed by the older. On the whole, these terrestrial disturbances have followed the same prevalent north-easterly trend, and hence a general tendency may be observed among the main ridges and valleys to run in that direction. The chains of the Ochil, Sidlaw, Pentland, Renfrew, Campsie, and Fintry Hills, and the valleys of Strathmore, Firth of Tay, and the basin of Midlothian, may be cited as examples. But, undoubtedly, the dominant cause in the determination of the topographical prominences and depressions of the district has been the relative hardness and softness of the rocks. Almost the whole of the eminences in the Lowlands consist of hard igneous rocks, forming not only chains of hills like those just referred to and others in Ayrshire and Lanarkshire, but isolated crags and hills like those of Stirling Castle, Edinburgh Castle, and others conspicuous in the scenery of Fife and the Lothians.

Of the three chief valleys in the central Lowlands two, those of the Tay and the Forth, descend from the Highlands, and one, that of the Clyde, from the southern uplands. Though on the whole transverse, these depressions furnish another notable example of that independence of geological structure already mentioned.

We now proceed to consider the leading physical features of the country with especial reference to their distinctive aspects and their respective modes of origin. Though an eminently hilly country, Scotland is not dominated by any leading mountain chain on which all the other topographical features are dependent. Its leading features are not the monotonous ridges of the high grounds but the valleys that have been opened through them. If these valleys were filled up, the high grounds would once more become what they probably were at first, elevated plains or plateaus, with no strongly marked features;—no eminences rising much above nor hollows sinking much below the general surface.

Valleys.

Valleys.—Even apart from any knowledge of their origin, the valleys of the country are thus seen to be its fundamental topographical element, and to deserve the first consideration in any attempt to describe and explain its physical features. The longitudinal valleys, which run in the same general direction as the ridges—that is, north-east and south-west—have had their trend defined by geological structure, such as a line of dislocation (the Great Glen), or the plications of the rocks (Lochs Erich, Tay, and Awe, and most of the sea lochs of Argyllshire). The transverse valleys run north-west or south-east and are for the most part independent of geological structure. The valley of the Garry and Tay crosses the strike of all the Highland rocks, traverses the great fault on the Highland border, and finally breaks through the chain of the Ochil Hills at Perth. The valley of the Clyde crosses the strike of the Silurian plications in the southern uplands, the boundary fault, and the ridges of the Old Red Sandstone, and pursues its north-westerly course across the abundant and often powerful dislocations of the Carboniferous system.

Origin of Scottish valleys.

That valleys are essentially due to erosion and not to dislocation or subsidence of the earth's surface is a fact which has now been demonstrated by so overwhelming a mass of evidence from all parts of the globe that it may be accepted as one of the axioms of geology. The plications of the earth's crust which folded the rocks of the Highlands and southern uplands not improbably upraised above the sea a series of longitudinal ridges having a general north-easterly

direction. The earliest rain that fell upon these ridges would run off them, first in transverse watercourses down each short slope and then in longitudinal depressions wherever such had been formed during the terrestrial disturbance. Once chosen, the pathways of the streams would be gradually deepened and widened into valleys. Hence the valleys are of higher antiquity than the mountains that rise from them. The mountains in fact have emerged out of the original bulk of the land in proportion as the valleys have been excavated. The denudation would continue so long as the ground stood above the level of the sea; but there have been prolonged periods of depression, when the ground, instead of being eroded, lay below the sea-level and was buried sometimes under thousands of feet of accumulated sediment, which completely filled up and obliterated the previous drainage-lines. When the land reappeared a new and independent series of valleys would at once begin to be eroded; and the subsequent degradation of these overlying sediments might reveal portions of the older topography, as in the case of the Great Glen, Lauderdale, and other ancient valleys. But the new drainage-lines have usually little or no reference to the old ones. Determined by the inequalities of surface of the overlying mantle of sedimentary material, they would be wholly independent of the geological structure of the rocks lying below that mantle. Slowly sinking deeper and deeper into the land, they might eventually reach the older rocks, but they would keep in these the lines of valley that they had followed in the overlying deposits. In process of time the whole of these deposits might be denuded from the area. The valleys would then be seen running in utter disregard of the geological structure of the rocks around them, and there might even remain no trace of the younger formations on which they began and which guided their excavation. This is probably the explanation of the striking independence of geological structure exhibited by the Tweed and the Nith.

Among the valleys of Scotland certain prevailing characteristics have been recognized in the popular names bestowed upon them. Characteristic "Straths" are broad expanses of low ground between bounding hills usually traversed by one main stream and its tributaries,—Strath Tay, Strath Spey, Strath Conon. The name, however, has also been applied to wide tracts of lowland which embrace portions of several valleys, but are defined by lines of heights on either side; the best example is afforded by Strathmore—the "great strath"—between the southern margin of the Highlands and the line of the Ochil and Sidlaw Hills. This long and wide depression, though it looks like one great valley, strictly speaking, includes portions of the valleys of the Tay, Isla, North Esk, and South Esk, all of which cross it. Elsewhere in central Scotland such a wide depression is known as a "howe," as in the Howe of Fife between the Ochil and Lomond Hills. A "glen" is usually a narrower and steeper-sided valley than a strath, though the names have not always been applied with discrimination. Most of the Highland valleys are true glens. The hills rise rapidly on either side, sometimes in grassy slopes, sometimes in rocky bosses and precipitous cliffs, while the bottom is occupied by a flat platform of alluvium through which a stream meanders. Frequently the bottom of some part of the valley is occupied by a lake. In the south of Scotland the larger streams flow in wide open valleys called "dales," as in Clydesdale, Tweeddale, Teviotdale, Liddisdale, Eskdale, Nithsdale. The strips of alluvial land bordering a river are known as "haughs," and where in estuaries they expand into wide plains they are termed "carse." The carse of the Forth extend seawards as far as Borrowstonness and consist chiefly of raised beaches. The Carse of Gowrie is the strip of low ground intervening between the Firth of Tay and the line of hills that stretches from Perth to Dundee.

River-gorges are characteristic features in many of the valleys of River-Scotland. In the Old Red Sandstone they are particularly prominent where that formation has lain in the pathway of the streams sweeping down from the Highlands. In the basin of the Moray Firth some fine examples may be seen on the Nairn and Findhorn, while on the west side of the Cromarty Firth some of the small streams descending from the high grounds of the east of Ross-shire have cut out defiles in the conglomerate, remarkable for their depth and narrowness. On the south side of the Highlands still more notable instances of true "cañons" in the Old Red Sandstone are to be seen where the Erich, Isla, and North Esk enter that formation. The well-known gorge in which the Falls of Clyde are situated is the best example in the midland valley.¹

Types of Mountain and Hill.—While the topography of the Flat-country is essentially the result of prolonged denudation, we may reasonably infer that the oldest surfaces likely to be in any measure mountain-preserved or indicated are portions of some of the platforms of tains. erosion which have successively been produced by the wearing away of the land down to the sea-level. Relics of these platforms seem to be recognizable both in the Highlands and among the southern uplands. Allusion has already been made to the remarkable flat-topped moorlands which in the eastern Grampians reach heights

¹ For the principal rivers, the Tay, Spey, Forth, Clyde, and Tweed, see the separate articles, and for the Dee (Aberdeen, Kirkcubright), &c., see articles on the respective counties.

of 3000 to 4000 feet above the sea. Their most familiar example perhaps is the top of Lochnagar, where when the level of 3500 feet has been gained the traveller finds himself on a broad undulating moor, more than a mile and a half long, sloping gently southwards towards Glen Muick and terminating on the north at the edge of a range of granite precipices. The top of Ben Macdui stands upon nearly a square mile of moor exceeding 4000 feet in elevation. These mountains lie within granite areas; but not less striking examples may be found among the schists. The mountains at the head of Glen Esk and Glen Isla, for instance, sweep upward into a broad moor some 3000 feet above the sea, the more prominent parts of which have received special names,—Driesh, Mayar, Tom Buidlie, Tolmount, Cairn na Glasla. It would hardly be an exaggeration to say that there is more level ground on the tops of these mountains than in areas of corresponding size in the valleys below. That these high plateaus are planes of erosion is shown by their independence of geological structure, the upturned edges of the vertical and contorted schists having been abruptly shorn off and the granite having been wasted and levelled along its exposed surface. They look like fragments of the original tableland of erosion out of which the present valley-systems of the Highlands have been carved. Among the southern uplands traces of a similar tableland of erosion are in many places to be detected. The top of Broad Law in Peeblesshire, for example, is a level moor comprising between 300 and 400 acres above the contour line of 2500 feet and lying upon the upturned edges of the greatly denuded Silurian grits and shales. An instructive example of the similar destruction of a much younger platform is to be found in the terraced plateaus of Skye, Eigg, Canna, Muck, Mull, and Morven, which are portions of what was probably originally a continuous plain of basalt. Though dating back only to older Tertiary time, this plain has been so deeply trenched by the forces of denudation that it has been reduced to mere scattered fragments. Thousands of feet of basalt have been worn away from many parts of its surface; deep and wide valleys have been carved out of it; and so enormously has it been wasted that it has been almost entirely stripped from wide tracts which it formerly covered and where only scattered outliers remain to prove that it once existed.

It is a curious fact, to which allusion has already been made, that broad flat-topped mountains are chiefly to be found in the eastern parts of the country. Traced westwards these forms gradually give place to narrow ridges and crests. No contrast, for instance, can be greater than that between the wide elevated moors of the eastern Grampians, and the crested ridges of western Inverness-shire and Argyllshire—Loch Hourm, Glen Nevis, Glencoe—or that between the broad uplands of Peeblesshire and the precipitous heights of Galloway. No satisfactory reason for these contrasts can be found in geological structure alone. Perhaps the key to them is to be sought mainly in differences of rainfall. The western mountains, exposed to the fierce dash of the Atlantic rains, sustain the heaviest and most constant precipitation. Their sides are seamed with torrents which tear down the solid rock and sweep its detritus into the glens and sea lochs. The eastern heights, on the other hand, experience a less rainfall and consequently a diminished rate of erosion. There is no reason to doubt that the present preponderance of rainfall in the west has persisted for an enormous duration of time.

Regarding the existing flat-topped heights among the eastern Grampians as representing what may have been the general character of the surface out of which the present Highlands have been carved, we can trace every step in the gradual obliteration of the tableland and in the formation of the most rugged and individualized forms of isolated mountain. In fact, in journeying westwards across the tops of the Highland mountains we pass, as it were, over successive stages in the history of the origin of Highland scenery. The oldest types of form lie on the east side and the newest on the west. From the larger fragments of the denuded tableland we advance to ridges with narrow tops, which pass by degrees into sharp rugged crests. The ridges, too, are more and more trenched until they become groups of detached hills or mountains. In the progress of this erosion full scope has been afforded for the modification of form produced by variations in geological structure. Each ridge and mountain has been cut into its shape by denudation, but its actual outlines have been determined by the nature of the rocks and the manner in which they have yielded to decay. Every distinct variety of rock has impressed its own characters upon the landscapes in which it plays a part. Hence, amid the monotonous succession of ridge beyond ridge and valley after valley, considerable diversity of detail has resulted from the varying composition and grouping of the rocks.

The process by which the ancient tablelands of the country have been trenched into the present system of valleys and confluent ridges is most instructively displayed among the higher mountains, where erosion proceeds at an accelerated pace. The long "screes" or talus-slopes at the foot of every crag and cliff bear witness to the continual waste of the mountain sides. The headwaters of a river cut into the slopes of the parent hill. Each valley is consequently

lengthened at the expense of the mountain from which it descends. Where a number of small torrents converge in a steep mountain recess, they cut out a crescent-shaped hollow or half-cauldron, which in the Scottish Highlands is known as a "corry." Whether Corries the convergent action of the streams has been the sole agency concerned in the erosion of these striking concavities, or whether snow glens, and glacier-ice may have had a share in the task, is a question that cannot at present be satisfactorily solved. No feature in Highland scenery is more characteristic than the corries, and in none can the influence of geological structure be more instructively seen. Usually the upper part of a corry is formed by a crescent of naked rock, from which long trails of debris descend to the bottom of the hollow. Every distinct variety of rock has its own type of corry, the peculiarities being marked both in the details of the upper cliffs and crags and in the amount, form, and colour of the screes. The Scottish corries have been occupied by glaciers. Hence their bottoms are generally well ice-worn or strewn over with moraine stuff. Not infrequently also a small tarn fills up the bottom, ponded back by a moraine. It is in these localities that we can best observe the last relics left by the retreat of the glaciers that once overspread the country. Among these high grounds also the gradual narrowing of ridges into sharp, narrow, knife-edged crests and the lowering of these into cols or passes can be admirably studied. Where two glens begin opposite to each other on the same ridge, their corries are gradually cut back until only a sharp crest separates them. This crest, attacked on each front and along the summit, is lowered with comparative rapidity, until in the end merely a low col or pass may separate the heads of the two glens. The various stages in this kind of demolition are best seen where the underlying rock is of granite or some similar material which possesses considerable toughness, while at the same time it is apt to be split and splintered by means of its numerous transverse joints. The granite mountains of Arran furnish excellent illustrations.

Where a rock yields with considerable uniformity in all directions to the attacks of the weather it is apt to assume conical forms in the progress of denudation. Sometimes this uniformity is attained of moun by a general disintegration of the rock into fine debris, which rolls tain down the slopes in long screes. In other cases it is secured by the intersection of joints, whereby a rock, in itself hard and durable, is divided into small angular blocks, which are separated by the action of the elements and slide down the declivities. In many instances the beginning of the formation of a cone may be detected on ridges which have been deeply trenched by valleys. The smaller isolated portions, attacked on all sides, have broken up under the influence of the weather. Layer after layer has been stripped from their sides, and the flat or rounded top has been narrowed until it has now become the apex of a cone. The mountain Schiehallion (3547 feet) is a noble instance of a cone not yet freed from its parent ridge. Occasionally a ridge has been carved into a series of cones united at their bases, as in the chain of the Pentland Hills. A further stage in denudation brings us to isolated groups of cones completely separated from the rest of the rocks among which they once lay buried. Such groups may be carved out of a continuous band of rock which extends into the regions beyond. The Paps of Jura, for instance, rise out of a long belt of quartzite which stretches through the islands of Isla, Jura, and Scarba. In many cases, however, the groups point to the existence of some boss of rock of greater durability than those in the immediate neighbourhood, as in the Cucullins and Red Hills of Skye and the group of granite cones of Ben Loyal, Sutherland. The most impressive form of solitary cone is that wherein after vast denudation a thick overlying formation has been reduced to a single outlier, such as Morven in Caithness and the two Ben Grams in Sutherland, and still more strikingly the pyramids of red sandstone on the western margin of Sutherland and Ross-shire. The horizontal stratification of some of these masses gives them a curiously architectural aspect, which is further increased by the effect of the numerous vertical joints by which the rock is cleft into buttresses and recesses along the fronts of the precipices and into pinnacles and finials along the summits. Solitary or grouped pyramids of red sandstone, rising to heights of between 3000 and 4000 feet above the sea, are mere remnants of a once continuous sheet of red sandstone that spread far and wide over the western Highlands.

Stratified rocks when they have not been much disturbed from Escarp- their original approximate horizontality weather into what are ments. called "escarpments,"—lines of cliff or steep bank marking the edge or outcrop of harder bands which lie upon softer or more easily eroded layers. Such cliffs may run for many miles across a country, rising one above another into lofty terraced hills. In Scotland the rocks have for the most part been so dislocated and disturbed as to prevent the formation of continuous escarpments, and this interesting form of rock-scenery is consequently almost entirely absent, except locally and for the most part on a comparatively small scale. The most extensive Scottish escarpments are found among the igneous rocks. Where lava has been piled up in successive nearly horizontal sheets, with occasional layers of tuff

or other softer rock between them, it offers conditions peculiarly favourable for the formation of escarpments. In the wide basalt plateaus of the Inner Hebrides these conditions have been manifested on a great scale. The Carboniferous lavas of the Campsie and Fintry Hills and of the south of Dumfriesshire and Roxburghshire likewise rise in lines of bold escarpment.

Lakes.—These important features in the landscapes of Scotland present the general characters of the water-basins so profusely scattered over the northern parts of Europe and North America. They may be classified in four groups, each of which has its own peculiar scenery and a distinct mode of origin—(1) glen lakes, (2) rock-tarns, (3) moraine-tarns, (4) lakes of the plains.

Glen
lakes.

(1) Glen lakes are those which occupy portions of glens. They are depressions in the valleys, not due to mere local heaping up of detritus, but true rock-basins, often of great depth. Much discussion has arisen as to their mode of origin. They have been regarded as caused by special subsidence of their areas, open fissures of the ground, general depression of the central part of each mountain district from which they radiate, and by the erosive action of glacier ice. That they are not open fissures and cannot be explained by any general subsidence of a neighbouring region is now generally admitted. That glaciers have occupied the glens where these lakes exist and have worn down the rocks along the sides and bottom cannot be doubted, but whether the ice would be capable of eroding hollows so deep as many of these lakes is a question which has been answered with equal confidence affirmatively and negatively. On the other hand, to suppose that each of these hollows has been caused by a special local subsidence would involve a complex series of subterranean disturbances, for which some better evidence than the mere existence of the basins is required. Under any circumstances it is quite certain that the lakes must be of recent geological date. Any such basins belonging to the time of the plication of the crystalline schists would have been filled up and effaced long ago. So rapid is the infilling by the torrents which sweep down detritus from the surrounding heights that the present lakes are being visibly diminished, and they cannot, therefore, be of high geological antiquity. It is worthy of remark that the glen lakes are almost wholly confined to the western half of the Highlands, where they form the largest sheets of fresh water. Hardly any lakes are to be seen east of a line drawn from Inverness to Perth. West of that line, however, they abound in both the longitudinal and the transverse valleys. The most remarkable line of them is that which fills up so much of the Great Glen. Loch Ness, the largest, is upwards of 20 miles long, about $1\frac{1}{2}$ miles broad, and not less than 774 feet deep in the deepest part. This great depression exceeds the general depth reached by the floor of the North Sea between Great Britain and the opposite shores of the Continent. Other important longitudinal lakes are Lochs Tay, Awe, Erioch, and Shiel. The most picturesque glen lakes, however, lie in transverse valleys, which being cut across the strike of the rocks present greater variety, and usually also more abruptness of outline. Lochs Lomond, Katrine, and Lubnaig in the southern Highlands, and Lochs Maree and More in the north, are conspicuous examples.

Rock-
tarns.

(2) Rock-tarns are small lakes lying in rock-basins on the sides of mountains or the summits of ridges, and on rocky plateaus or plains. Unlike the glen lakes, they have no necessary dependence upon lines of valley. On the contrary, they are scattered as it were broadcast over the districts in which they occur, and are by far the most abundant of all the lakes of the country. Dispersed over all parts of the western Highlands, they are most numerous in the north-west, especially in the Outer Hebrides and in the west of Ross-shire and Sutherland. The surface of the Archaean gneiss is so thickly sprinkled with them that many tracts consist almost as much of water as of land. They almost invariably lie on strongly ice-worn platforms of rock. Their sides and the rocky islets which diversify their surface have been powerfully glaciated. They cannot be due to either fracture or subsidence, but are obviously hollows produced by erosion. They have accordingly with much probability been assigned to the gouging action of the sheets of land-ice by which the general glaciation of the country was effected. In the southern uplands, owing probably to the greater softness and uniformity of texture among the rocks, rock-tarns are comparatively infrequent, except in Galloway, where the protrusion of granite and its associated metamorphism have given rise to conditions of rock-structure more like those of the Highlands. Over the rocky hill-ranges of the central Lowlands rock-tarns occasionally make their appearance.

Moraine-
tarns.

(3) Moraine-tarns—small sheets of water ponded back by some of the last moraines shed by the retreating glaciers—are confined to the more mountainous tracts. Among the southern uplands many beautiful examples may be seen, probably the best known and certainly one of the most picturesque being the wild lonely Loch Skene lying in a recess of Whitecumb at the head of the Moffat Water. Others are sprinkled over the higher parts of the valleys in Galloway. None occur in the central Lowlands. In the Highlands they may be counted by hundreds, nestling in the bottoms of the corries. In the north-western counties, where the

glaciers continued longest to descend to the sea-level, lakes retained by moraine-barriers may be found very little above the sea.

(4) The lakes of the plains lie in hollows of the glacial detritus Lakes which is strewn so thickly over the lower grounds. As these of the hollows were caused by original irregular deposition rather than plains, by erosion, they have no intimate relation to the present drainage-lines of the country. The lakes vary in size from mere pools up to wide sheets of water several square miles in area. As a rule they are shallow in proportion to their extent of surface. Though still sufficiently numerous in the Lowlands, they were once greatly more so, for, partly from natural causes and partly by artificial means, they have been made to disappear. The largest sheets of fresh water in the midland valley are of this class, as Loch Leven and the Lake of Menteith.

Coast-Line.—The eastern and western seaboard of Scotland Coast-present a singular contrast. The former is indented by a series of fine, broad arms of the sea, but is otherwise tolerably unbroken. The land slopes gently down to the margin of the sea or to the edge of cliffs that have been cut back by the waves. The shores are for the most part low, with few islands in front of them, and cultivation comes down to the tide-line. The western side of the country, on the contrary, is from end to end intersected with long narrow sea lochs or fjords. The land shelves down rapidly into the sea and is fronted by chains and groups of islands. This contrast has sometimes been erroneously referred to greater erosion by the waves on the western than on the eastern coast. The true explanation, however, must be sought in the geological structure of the land. The west side of Scotland, as we have seen, has been more deeply eroded than the eastern. The glens are more numerous there and on the whole deeper and narrower. Many of them are prolonged under the sea; in other words, the narrow deep fjords which wind so far into the land are seaward continuations of the glens which emerge from their upper ends. The presence of the sea in these fjords is an accident. If they could be raised out of the sea they would become glens, with lakes filling up their deeper portions. That this has really been their history can hardly admit of question. They are submerged land-valleys, and as they run down the whole western coast they show that side of the country to have subsided to a considerable depth beneath its former level. The Scottish sea lochs must be viewed in connexion with those of western Ireland and of Norway. The whole of this north-western coast-line of Europe bears witness to recent submergence. The bed of the North Sea, which at no distant date in geological history was a land surface across which plants and animals migrated freely into Great Britain, sank beneath the sea-level, while the Atlantic advanced upon the western margin of the continent and filled the seaward ends of what had previously been valleys open to the sun. Not improbably the amount of subsidence was greater towards the west.

Nearly the whole coast-line of Scotland is rocky. On the east side of the country, indeed, the shores of the estuaries are generally low, but the land between the mouths of these inlets is more or less precipitous. On the west side the coast is for the most part either a steep rocky declivity or a sea-wall, though strips of lower ground are found in the bays. The sea-cliffs everywhere vary in their characters according to the nature of the rock out of which they have been carved. At Cape Wrath precipices nearly 300 feet high have been cut out of the Archaean gneiss. The varying texture of this rock, its irregular foliation and jointing, and its ramifying veins of pegmatite conspire to give it very unequal powers of resistance in different parts of its mass. Consequently it projects in irregular bastions and buttresses and retires into deep recesses and tunnels, showing everywhere a ruggedness of aspect which is eminently characteristic. In striking contrast to these precipices are those of the Cambrian red sandstone a few miles to the east. Vast vertical walls of rock shoot up from the waves to a height of 600 feet, cut by their perpendicular joints into quadrangular piers and projections, some of which even stand out alone as cathedral-like islets in front of the main cliff. The sombre colouring is relieved by lines of vegetation along the edges of the nearly flat beds which project like vast cornices and serve as nesting-places for crowds of sea-fowl. On the west side of the country the most notable cliffs south from those of Cape Wrath and the Cambrian sandstones of Sutherland are to be found among the basaltic islands, particularly in Skye, where a magnificent range of precipices rising to 1000 feet bounds the western coast-line. The highest cliffs in the country are found among the Shetland and Orkney Islands. The sea-wall of Foula, one of the Shetland group, and the western front of Hoy in Orkney rise like walls to heights of 1100 or 1200 feet above the waves that tunnel their base. Caithness is one wide moor, terminating almost everywhere in a range of sea-precipices of Old Red Sandstone. Along the eastern coast-line most of the cliffs are formed of rocks belonging to the same formation. Beginning at Stonehaven, an almost unbroken line of precipice varying up to 200 feet in height runs southwards to the mouth of the estuary of the Tay. The southern uplands plunge abruptly into the sea near St Abb's Head in a noble range of precipices 300 to 500 feet in height, and on the western side the same high grounds

terminate in a long broken line of sea-wall, which begins at the mouth of Loch Ryan, extends to the Mull of Galloway, and reappears again in the southern headlands of Wigtown and Kirkcudbright. One of the most picturesque features of the Scottish sea-cliffs is the numerous "stacks" or columns of rock which during the demolition and recession of the precipices have been isolated and left standing amidst the waves. These remnants attain their most colossal size and height on the cliffs of Old Red Sandstone. Thus the Old Man of Hoy in Orkney is a huge column of yellow sandstone between 400 and 500 feet high, forming a conspicuous landmark in the north. The coast of Caithness abounds in outstanding pillars and obelisks of flagstone.

The low shores on the west coast are not infrequently occupied by sand-dunes. Such accumulations fringe the western margin of North and South Uist, and are found in many bays from the north of Sutherland to the coast of Ayrshire. They are more abundant on the east coast, especially on the shores of Aberdeenshire, between the mouths of the two Esks, on both sides of the mouth of the Firth of Tay, and at various places in the Firth of Forth. Raised sea-beaches likewise play a part in the coast scenery of the country. These alluvial terraces form a strip of low fertile land between the edge of the sea and the rising ground of the interior, and among the western fjords sometimes supply the only arable soil in their neighbourhood, their flat green surfaces presenting a strong contrast to the brown and barren moors that rise from them. Most of the seaport towns of the country stand upon platforms of raised beach. Considerable deposits of mud, silt, and sand are accumulating in most of the estuaries. In the Tay, Forth, and Clyde, where important harbours are situated, considerable expense is involved in dredging to remove the sediment continually brought down from the land and carried backward and forward by the tides. Wide alluvial flats are there exposed at low water.

Islands.

While no islands except mere solitary rocks like May Island, the Bass Rock, and Inchkeith diversify the eastern seaboard, the western side of Scotland presents a vast number, varying in size from such extensive tracts as Skye down to the smallest sea-stack or skerry. Looked at in the broadest way, these numerous islands may be regarded as belonging to two groups or series,—the Outer and the Inner Hebrides. The Outer Hebrides, extending from Barra Head to the Butt of Lewis, consist of a continuous chain of islands composed (with the exception of a small tract in the east of Lewis) entirely of Archæan rocks. Most of the ground is low, rocky, and plentifully dotted over with lakes; but it rises into mountainous heights in Harris, some of the summits attaining elevations of 2600 feet. The general trend of this long belt of islands is north-north-east. The Inner Hebrides form a much less definite group. They may be regarded as beginning with the Shiant Isles in the Minch and stretching to the southern headlands of Isla, the most important members being Skye, Mull, Isla, Jura, Rum, Eigg, Coll, Tiree, and Colonsay. The irregularity of this fringe of islands has no doubt been in chief measure brought about by its remarkable diversity of geological structure. Archæan gneiss, Cambrian sandstone, Silurian quartzite, limestone, and schist, Jurassic sandstone and limestone, Cretaceous sandstone, and Tertiary basalts, gabbros, and granitic rocks all enter into the composition of the islands.

Influences of topography on inhabitants.

Within the limits of this article it is only possible to allude to some of the more important influences of the topography on the history of the inhabitants. How powerfully the configuration of the country affects the climate is shown in the remarkable difference between the rainfall of the mountainous west and of the lowland east. This difference has necessarily affected the character and employments of the people, leading to the development of agriculture on the one side and the raising of sheep and cattle on the other. The fertile low grounds on the east have offered facilities for the invasions of Romans, Norsemen, and English, while the mountainous fastnesses of the interior and the west have served as secure retreats for the older Celtic population. While, therefore, Teutonic people have spread over the one area, the earlier race has to this day maintained its ground in the other. Not only the external configuration but the internal geological structure of the country has profoundly influenced the progress of the inhabitants. In the Highlands no mineral wealth has been discovered to stimulate the industry of the natives or to attract the labour and capital of strangers. These tracts remain still as of old sparsely inhabited and given over to the breeding of stock and the pursuit of game. In the Lowlands, on the other hand, rich stores of coal, iron, lime, and other minerals have been found. The coal-fields have gradually drawn to them an ever-increasing share of the population. Villages and towns have there sprung recently into existence and have rapidly increased in size. Manufactures have been developed and commerce has advanced with accelerated pace. Other influences have of course contributed largely to the development of the country, but among them all the chief place must undoubtedly be assigned to that fortunate geological structure which, amid the revolutions of the past, has preserved in the centre of Scotland those fields of coal and ironstone which are the foundations of the national industry. (A. G.E.)

Climate.—In considering the climate of Scotland the first place

Climate.

must be assigned to the temperature of the various districts during the months of the year, it being this which gives the chief characteristics of climate and not the mean temperature of the whole year. Thus, while the annual temperatures of the west and east coasts are nearly equal, the summer and winter temperatures are very different. At Portree (on east coast of Skye) the mean temperatures of January and July are 39° and 56°·8, whereas at Perth they are 37°·5 and 59°·0. The prominent feature of the isothermals of the winter months is their north and south direction, thus pointing not to the sun but to the warm waters of the Atlantic as the more powerful influence in determining the Scottish climate at this season through the agency of the prevailing westerly winds. The Atlantic is in truth a vast repository of heat, in which the higher temperature of summer and that of more southern latitudes are treasured up against the rigours of winter; and in exceptionally cold seasons the ocean protects all places in its more immediate neighbourhood against the severe frosts which occur in inland situations. While this influence of the ocean is felt at all seasons, it is most strikingly seen in winter; and it is more decided in proportion as the locality is surrounded by the warm waters of the Atlantic. At Edinburgh the temperature is 27°·0 and at Lerwick 32°·5 higher than would otherwise be the case; in other words, but for the ameliorating influence of the Atlantic the temperature of Edinburgh in mid-winter would only be 12°·5 and of Lerwick 7°·5, or such winters as characterize the climates of Greenland and Iceland. The influence of the North Sea is similarly apparent, but in a less degree. Along the whole of the eastern coast, from the Pentland Firth southwards, temperature is higher than what is found a little inland to the west. The lowest temperature yet observed in the British Isles was -16°·0, which occurred near Kelso in December 1879. In summer, everywhere, latitude for latitude, temperature is lower in the west than in the east and inland situations. In winter the inland climates are the coldest, but in summer the warmest. The course of the isothermal lines at this season is very instructive. Thus the line of 59° passes from the Solway directly northwards to the north of Perthshire and thence curves round eastwards to near Stonehaven. From Teviotdale to the Grampians temperature falls only one degree; but for the same distance farther northwards it falls three degrees. The isothermal of 56° marks off the districts where the finer cereals are most successfully raised. This distribution of the temperature shows that the influence of the Atlantic in moderating the heat of summer is very great and is felt a long way into the interior of the country. On the other hand, the high lands of western districts by robbing the westerly winds of their moisture, and thus clearing the skies of eastern districts, exercise an equally striking effect in the opposite direction,—in raising the temperature.

There is nearly twice as much wind from the south-west as from the north-east, but the proportions vary greatly in different months. The south-west prevails most from July to October, and again from December to February; accordingly in these months the rainfall is heaviest. These are the summer and winter portions of the year, and an important result of the prevalence of these winds, with their accompanying rains, which are coincident with the annual extremes of temperature, is to imprint a more strictly insular character on the Scottish climate, by moderating the heat of summer and the cold of winter. The north-east winds acquire their greatest frequency from March to June and in November, which are accordingly the driest portions of the year.

The mountainous regions of Scotland are mostly massed in the west and lie generally north and south, or approximately perpendicular to the rain-bringing winds from the Atlantic. Hence the westerly winds are turned out of their horizontal course, and, being thrust up into the higher regions of the atmosphere, their temperature is lowered, when the vapour is condensed into cloud and deposits in rain the water they can no longer hold in suspension. Thus the climates of the west are essentially wet. On the other hand, the climates of the east are dry, because the surface is lower and more level; and the breezes borne thither from the west, being robbed of most of their superabundant moisture in crossing the western hills, are therefore drier and precipitate a greatly diminished rainfall. It thus happens that the driest climates in the east are those which have to south-westwards the broadest extent of mountainous ground, and that the wettest eastern climates are those which are least protected by high lands on the west. The breakdown of the watershed between the Firths of Clyde and Forth exposes southern Perthshire, the counties of Clackmannan and Kinross, and nearly the whole of Fife to the clouds and rains of the west, and their climates are consequently wetter than those of any other of the eastern slopes of the country. The driest climates of the east, on the other hand, are in Tweeddale about Kelso and Jedburgh, the low grounds of East Lothian, and those on the Moray Firth from Elgin round to Dornoch. In these districts the annual rainfall for the twenty-four years ending 1883 was about 26 inches, whereas over extensive breadths in the west it exceeds 100 inches, in Glenroe being nearly 180 inches and on the top of Ben Nevis 150 inches. (A. B.)

PART III.—STATISTICS.

Popula-
tion.

Population; Vital and Social Statistics.—At the end of the 15th century it is supposed that the population of Scotland did not exceed 500,000,—Edinburgh having about 20,000 inhabitants, followed by Perth with about 9000, and Aberdeen, Dundee, and St Andrews each with about 4000. By the time of the Union in 1707 it is supposed to have reached 1,000,000, while according to the returns furnished by the clergy to Dr Webster in 1755 it was 1,265,380. At the time of the first Government census in 1801 it had reached 1,608,420. The increase through all the succeeding decades has been continuous, though fluctuating in amount, and in 1881 it had reached 3,735,573 (males 1,799,475, females 1,936,098),—an increase within the eighty years of 132 per cent. During the same period the population of England and Wales had increased 192 per cent., while the population of Ireland, owing to a rapid decrease since 1841, does not now differ greatly from what it was at the beginning of the century. The following table (I.) gives the areas of the various counties and of the whole of Scotland, the population in 1871 and 1881, the number of persons to the square mile of land-surface in the latter year, and the increase or decrease per cent. between 1871 and 1881:—

Counties.	Area in Acres.	Population.		Pop. per Sq. Mile, 1881.	Increase or Decrease per cent. 1871-1881.
		1871.	1881.		
Aberdeen	1,262,098	244,608	267,990	137	+ 9.56
Argyll	2,134,274	75,679	76,468	24	+ 1.04
Ayr	735,262	200,809	217,519	193	+ 8.82
Banff	413,781	62,028	62,786	98	+ 1.15
Berwick	297,161	36,486	35,392	77	- 3.00
Bute	143,997	16,977	17,657	81	+ 4.00
Caithness	448,867	39,992	38,865	57	- 2.82
Clackmannan	31,876	23,747	25,680	589	+ 8.14
Dumbarton	172,677	58,867	75,338	312	+27.99
Dumfries	705,946	74,808	76,140	72	+ 1.78
Edinburgh	284,926	328,879	389,164	1075	+18.51
Elgin or Moray	312,346	48,128	48,788	92	+ 1.53
Fife	323,427	160,735	171,931	349	+ 6.96
Forfar	569,851	237,587	206,360	304	+12.12
Haddington	179,142	37,771	38,502	142	+ 1.94
Inverness	2,767,078	88,015	90,454	22	+ 2.77
Kincardine	248,195	34,630	34,461	90	- 0.48
Kinross	49,812	7,198	6,697	92	- 6.96
Kirkcudbright	610,343	41,859	42,127	47	+ 0.64
Linark	568,868	765,339	904,412	1026	+18.17
Linlithgow	81,118	40,965	43,510	363	+ 6.21
Nairn	127,906	10,225	10,455	58	+ 2.25
Orkney and Shetland	638,332	62,882	61,749	85	+ 2.46
Peebles	227,869	12,330	13,822	54	- 6.02
Perth	1,664,690	127,768	129,007	39	+12.10
Renfrew	162,428	216,947	263,374	51	+ 0.97
Ross and Cromarty	2,078,896	80,955	78,547	1075	+21.40
Stirling	428,464	49,407	53,442	25	- 2.97
Sutherland	1,859,846	24,817	23,870	30	+ 8.17
Wigtown	327,906	38,830	36,611	99	+87.65
Total	19,777,490	3,360,018	3,735,573	251	+14.48
				12	- 3.89
				79	- 0.56

Table II. (see below) affords a comparison of the numbers of the population in 1861, 1871, and 1881 as grouped in towns, villages, and rural districts. The returns do not afford a means of comparison between earlier years than those given. A striking fact deserving of mention is that in every county in Scotland the population increased between 1801 and 1841, the increase being more than

10 per cent. in each county, with the exception of Argyll, Perth, and Sutherland. The census returns for these years do not supply materials for an accurate estimate as to the increase of the purely rural or agricultural population, but it must have been considerable. Between 1841 and 1881 the following counties declined in population:—Argyll, Inverness, Kinross, Perth, Ross and Cromarty, Sutherland, and Wigtown,—all chiefly agricultural, and five of them in the Highlands, where much of the land was held by crofters. Only one county, Kinross, has a smaller population in 1881 than in 1801. Between 1851 and 1881 the island population, chiefly crofters, decreased by 4866, and the rural population between 1861 and 1881 by 125,583. In the following Highland counties the diminution in rural population between 1861 and 1881 was as follows:—Argyll from 60,109 to 46,081, Caithness from 28,279 to 24,309, Inverness from 74,439 to 67,355, Perth from 69,480 to 57,016, Ross and Cromarty from 59,147 to 49,882, and Sutherland from 21,560 to 18,696. In the total population of Scotland the rate of increase was considerably less between 1841 and 1881 than during the first forty years of the century,—42.5 to 62.9 per cent. The rates per cent. of increase in the several decades from 1801 have been as follows:—12.27, 15.82, 13.04, 10.82, 10.25, 6.972, and 11.18. The high rate of increase between 1871 and 1881 was due to an exceptional briskness of trade, and unless it has been maintained (which is not probable) the estimate of the registrar-general, which makes the population in 1885 number 3,907,736, must be regarded as much too sanguine. Table III. (see below) gives the population of the eight largest towns of Scotland at decennial periods since 1801. It is a curious fact that each of these towns has maintained its place in the "eight," although several towns now tread closely on the heels of Perth, whose rate of progress with that of Paisley has lagged greatly behind that of the other six.

While in England and Wales the number of persons to the square mile in 1881 was 452 and in Ireland 159, in Scotland the number of persons to the square mile was only 125. The small density of Scotland is due chiefly to the large proportion of mountainous land. In the north-western counties the density was only 23 to the square mile, in the northern 34, in the west midland 68, in the southern 68, while in the north-eastern it was 115, in the east midland 149, in the south-eastern 299, and in the south-western—Renfrew, Ayr, and Lanark—614. Table IV. (see p. 529) shows by the excess of births over deaths the increase that should have taken place between 1861 and 1871, and between 1871 and 1881 (but for the balance of emigration over immigration), compared with the actual increase, the grouping being into towns with over 25,000 inhabitants, towns between 10,000 and 25,000, towns under 10,000 and above 2000, and rural districts. It is impossible to make a comparison between 1861 and 1881 inasmuch as the proportion of large and small towns and rural districts has varied. It must also be explained that in comparing 1861 and 1871 the census of 1861 is taken as the authority for the grouping and in comparing 1871 and 1881 the census of 1871. This table shows in both decades an actual increase in the large and in the principal towns greater than that resulting from excess of births over deaths. It is the result not only of migration from the small towns and rural districts but of the immigration of English, Irish, and foreigners, and the return of natives of Scotland from abroad. By a comparison with Table II. it will be observed that the increase in the rural districts between the decades in Table IV. occurs only in the villages, and a closer examination of Table IV. further shows that any seeming increase is really delusive, and arises from the fact that there is no provision for the increase in

TABLE II.

Groups.	Total Population.			Increase or Decrease, 1861 to 1871.		Increase or Decrease, 1871 to 1881.		Percentage to Total Population.

Perth	16,888	16,564	18,197	19,288	20,407	28,885	25,250	25,585	28,980	31,322

the number of small towns. Thus according to the grouping of 1871 the rural population of 1871 was nearly 28,000 less than the rural population of 1861 according to the grouping of 1861. It is from the villages and small towns that the large towns are principally recruited, the purely rural population preferring as a rule to emigrate.

Nation-
ality. Table V. shows the nationalities of the people of Scotland in 1871 and 1881, with the nationalities in 1881 in those burghs which had a population of 10,000 and upwards:—

Nationalities.	Scotland 1871.		Scotland 1881.		Burghs 1881.	
	Number.	Per-centage to Pop.	Number.	Per-centage to Pop.	Number.	Per-centage to Pop.
Scots	3,061,581	91.117	3,397,759	90.957	1,429,012	87.116
Irish	207,770	6.184	218,745	5.856	141,626	8.684
English	69,401	2.065	90,017	2.410	51,402	3.184
British colonials ..	9,740	0.290	12,874	0.345	7,768	0.473
British subjects from abroad	5,068	0.151	7,024	0.188	4,954	0.254
Foreigners	4,698	0.140	6,899	0.171	4,171	0.202
Welsh	1,081	0.032	1,806	0.048	882	0.054
From Channel Isles ..	729	0.021	949	0.025	545	0.033
Totals	3,360,018	100.000	3,735,573	100.000	1,640,360	100.000

This table indicates not merely an actual but a proportional increase in non-natives, there being an actual increase but a proportional decrease of natives of Ireland, and both an actual and a proportional increase of natives of England. Over the whole of Scotland the proportion of non-natives is a little over 9 per cent., while in the burghs it is nearly 13 per cent. The number of persons of Scottish birth in Ireland in 1881 was 22,328, and in England it was 253,528,—a total in the two countries of 275,856. On the other hand, the natives of the two countries in Scotland in 1881 were together 308,762, so that there is a smaller migration from Scotland to these countries than from these countries to Scotland.

Emigra-
tion. The following table (VI.) shows the emigration of persons of Scottish origin from the United Kingdom at various periods since 1853:—

Years	1853-55	1856-60	1861-65	1866-70	1871-75	1876-80	1881-85	1885-89
Emigrants	62,514	59,016	62,461	85,621	95,055	70,596	138,527	568,790

Comparing 1856-60 with 1881-85 it will be seen that the number of emigrants has more than doubled,—an increase of course proportionately much greater than the population. There are no statistics as to the number of immigrants into Scotland; and the significance of Table VI. is further lessened by the fact that it includes persons who may have been for some time resident in England or Ireland, or who may have been born there of Scottish parentage, and also supplies no information regarding emigration to the Continent. Only the principal ports, moreover, are included in the return.

Vital
statistics. The male population in 1881 was 1,799,475, an increase since 1871 of 12.2 per cent.; the female population 1,936,098, an increase of only 10.2 per cent. Since 1811, when there were 118.5 females to every 100 males, the proportion has been continuously diminishing, and in 1881 it was 107.6, but still greater than prevails either in England, which was 105.5, or in Ireland, which was 104.3. The proportion differs greatly in different counties, being as high as 134.71 in Shetland, chiefly on account of the number of males at sea. In Scotland the proportion of female births is smaller than that of male births: in 1885 it was 100 to 105; and males preponderate in the population up till the age of twenty-five, clearly showing that the excess of females is due to male emigration or the greater mortality of male occupations. The percentage

of illegitimate to the total number of births in 1855 was 7.8, and reached its maximum in 1865, when it was 10.2, while in 1885 it was 8.46. It is much higher in the lowland rural districts than in the Highland rural districts, and lowest in the large towns. The percentages of births, deaths, and marriages to population in the annual reports of the registrar-general are in a great degree misleading, inasmuch as the estimated population generally differs greatly from the actual. They place it, however, beyond doubt that the greatest birth, marriage, and mortality rates are in the town districts, that the smallest birth and marriage rates are in the insular districts, after which come the mainland rural districts, and that the mortality is not so high in the insular rural as in the mainland rural districts. Table VII. (see below) gives the percentage of single, married, and widowed to the total of each sex in Scotland, England and Wales, and Ireland respectively in 1881.

The number of blind persons in Scotland in 1881 was 3158 Blind, (males 1556, females 1602), the proportion to the total population &c. being 1 in 1182 (males 1156, females 1208); the proportion in 1871 was 1 in 1112. The deaf and dumb in 1881 numbered 2142 (males 1149, females 993), the proportion to the total population being 1 in every 1744 as against 1 in every 1610 in 1871. The number of lunatics was returned as 8406 (males 3939, females 4467) or 1 in every 444 of the total population, the proportion in 1871 being 1 in every 494. In addition to this there were 5991 imbeciles (males 2896, females 3095), or 1 to every 623 of the population, the proportion in 1871 being 1 in every 727.

Table VIII. gives a classification of the population according to Occupations in 1871 and 1881:—

Classes of Occupation.	1871.	1881.	Per cent. of Total Pop.	
			1871.	1881.
1. Professional	72,911	96,103	2.17	2.57
2. Domestic	159,408	176,565	4.74	4.78
3. Commercial	114,694	132,126	3.41	3.54
4. Agricultural	270,008	269,537	8.04	7.21
5. Industrial	751,281	932,653	22.36	24.97
6. Unproductive	1,091,721	2,128,589	59.28	56.98

It should be explained that the apparent diminution in the proportion of the unproductive class may be accounted for by the fact ism. that in 1871 paupers were returned in this class, whereas in 1881 they were returned under the occupation at which they used to work. The increase in the proportion of the professional and commercial classes is at least a slight indication of higher average prosperity, but this is more conclusively established by the fact that the number of paupers has for many years been steadily on the decline, the proportion being now (1886) only 2.4 of the population. The average cost of maintenance is, however, on the increase, owing entirely to the increased cost of the maintenance of the lunatic poor.

Crime, like pauperism, is also steadily declining, as is shown Crime. by Table IX.:

Offences.	Average.				1884.		Total.
	1836-40.	1851-55.	1875-79.	1880-84.	Males.	Females.

Roads. *Communication.*—In the 12th century an Act was passed providing that the highways between market-towns should be at least 20 feet broad. Over the principal rivers at this early period there were bridges near the most populous places, as over the Dee near Aberdeen, the Esk at Brechin, the Tay at Perth, and the Forth near Stirling. Until the 16th century, however, traffic between distant places was carried on chiefly by pack-horses. The first stage-coach in Scotland was that which ran between Edinburgh and Leith in 1610. In 1658 there was a fortnightly stage-coach between Edinburgh and London, but afterwards it would appear to have been discontinued for many years. Separate Acts enjoining the justices of the peace, and afterwards along with them the commissioners of supply, to take measures for the maintenance of roads were passed in 1617, 1669, 1676, and 1686. These provisions had reference chiefly to what afterwards came to be known as "statute labour roads," intended primarily to supply a means of communication within the several parishes. They were kept in repair by the tenants and cotters, and, when their labour was not sufficient, by the landlords, who were required to "stent" (assess) themselves, customs also being sometimes levied at bridges, ferries, and causeways. By separate local Acts the "statute labour" was in many cases converted into a payment called "conversion money," and the General Roads Act of 1845 made the alteration universal. By the Roads and Bridges (Scotland) Act of 1878 the old organization for the management of these roads was entirely superseded in 1883. The Highlands had good (military) roads earlier than the rest of the country. The project, begun in 1725, took ten years to complete, and the roads were afterwards kept in repair by an annual parliamentary grant. In the Lowlands the main lines of roads have been constructed under the Turnpike Acts, the earliest of which was obtained in 1750. Originally they were maintained by tolls exacted from those who used them; but this method was—after several counties had obtained separate Acts for its abolition—superseded throughout Scotland in 1883 by the general Act of 1878, providing for the maintenance of all classes of roads by assessment levied by the county road trustees.

Canals. Scotland possesses two canals constructed primarily to abridge the sea passage round the coast,—the Caledonian and the Crinan. The Caledonian Canal, extending from south-west to north-east, a distance of 60 miles along the line of lochs from Loch Linnhe on the west coast to the Moray Firth on the east coast, was begun in 1803, opened while yet unfinished in 1822, and completed in 1847, the total cost being about £1,300,000. Constructed originally to afford a quicker passage for ships to the east coast of Scotland and the coasts of Europe, it has, owing to the increased size of vessels, ceased to fulfil this purpose, its chief service having been in opening up a picturesque route for tourists, assisting local trade, and affording a passage for fishing boats between the east and west coasts. The Crinan Canal, stretching across the Mull of Cantyre from Loch Gilp to Jura Sound, a distance of 9 miles, and admitting the passage of vessels of 200 tons burden, was opened in 1801 at a cost of over £100,000. The principal boat canals are the Forth and Clyde or Great Canal, begun in 1798, between Grangemouth on the Forth and Bowling on the Clyde, a distance of 30½ miles, with a branch to Port Dundas, making the total distance 33½ miles; the Union Canal between Edinburgh and the Forth and Clyde Canal at Port Dundas, near Glasgow, completed in 1822; and the Monkland Canal, completed in 1791, connecting Glasgow with the Monkland mineral district and communicating with a lateral branch of the Forth and Clyde Canal at Port Dundas. Several other canals in Scotland have been superseded by railway routes.

Railways. The first railway in Scotland for which an Act of Parliament was obtained was that between Kilmarnock and Troon (9½ miles), opened in 1812, and of course worked by horses. A similar railway, of which the chief source of profit was the passenger traffic, was opened between Edinburgh and Dalkeith in 1831, branches being afterwards extended to Leith and Musselburgh. By 1840 the length of the railway lines in Scotland for which Bills were passed was 191½ miles, the capital being £3,122,133. The chief railway companies in Scotland are the Caledonian, formed in 1845, total capital in 1884-85 £37,999,933; the North British, of the same date, total capital £32,821,526; the Glasgow and South-Western, formed by amalgamation in 1850, total capital £13,230,849;

the Highland, formed by amalgamation in 1865, total capital £4,445,316; and the Great North of Scotland, 1846, total capital £4,869,933. The management of the small branch lines belonging to local companies is generally undertaken by the larger companies. By 1849 there were 795 miles of railway in Scotland. The following table (X.) shows the progress since 1857 (see also RAILWAY, vol. xx. pp. 226-230):—

Year.	Mean Length.	Passengers.				Receipts from Passenger Trains.	Receipts from Goods Trains.	Total.
		First Class.	Second Class.	Third and Mixed Classes.	Total.			
1857	1243	1,823,542	2,180,284	10,729,677	14,733,503	916,697	1,584,781	2,501,478
1874	2700	4,261,473	3,709,485	30,189,934	38,220,892	2,350,593	3,884,424	6,235,017
1884	2999	4,711,500	2,715,932	46,877,642	54,305,074	2,981,737	4,426,023	7,357,760

Agriculture.—Table XI. shows the divisions of land as regards ownership according to the return (the latest) of 1873:—

Owners holding each	Number of Owners.	Estimated Acreage.	Gross Annual Value.	Average Rental per Acre.	Percentage of Total Acreage to each Owner.
Less than 1 acre	118,005	28,177	£ 5,800,046	205 17	1
More than 1 acre and less than 10	9,471	29,327	1,433,106	48 17	2
" 10 " 50	3,469	77,619	843,471	10 17	4

Total	132,136	18,946,694	13,698,804	1 0	100

Scotland, as compared with either England or Ireland, is emphatically a country of large proprietors. Taking the population of 1871 as the basis of comparison, a little over 3 per cent. of the population of Scotland have a share in the ownership of the soil, the proportion in England and Wales being about 5 per cent., while in Ireland it is only about 1·7. On an average each owner in England possesses 33 acres, in Scotland 143, and in Ireland 293. While in Ireland, however, only a little over one-half of the number of proprietors possess less than 1 acre, and in England about five-sevenths, this class in Scotland amounted to about five-sixths of the whole. They possessed only 1 per cent. of the total area, the remaining 99·9 being possessed by 19,131 persons, while 171 persons held 58·3, and 68 persons 42·1. Whereas in England 1 and in Ireland only 3 proprietors held upwards of 100,000 acres each, in Scotland there were 24 persons who each held more than this amount, and together they possessed 26·1 per cent. of the total area. The excessive size of the properties of Scotland may be partly accounted for by the fact that a large proportion of the land is so mountainous and unproductive as to be unsuitable for division into small properties; but two other causes have also powerfully co-operated with this, viz., the wide territorial authority exercised by some of the lowland nobles, as the Scotts and Douglasses, and such powerful Highland nobles as the Argylls and Breadalbanes, and the stricter law of entail introduced by the Act of 1685 (see ENTAIL, vol. viii. p. 452). The largest estates are thus in the hands of the old hereditary families. The almost absolute power anciently wielded by the landlords, who within their own territories were lords of regality, tended to hinder independent agricultural enterprise, and it was not till after the abolition of hereditary jurisdictions in 1746 that agriculture in Scotland made any real progress.

The following table (XII.) gives a classification of the holdings of Scotland in 1875 and 1880:—

Years.	50 Acres and under.		From 50 to 100 Acres.		From 100 to 300 Acres.		From 300 to 500 Acres.		From 500 to 1000 Acres.		Above 1000 Acres.		Total.	
	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.	Number.	Area in Acres.
1875	56,811	666,356	9878	697,620	11,823	1,980,081	1967	729,885	691	427,478	126	109,675	80,796	4,611,095
1880	55,280	658,295	9726	721,814	12,848	2,082,914	2007	750,295	661	418,650	79	114,298	80,101	4,741,296

It will be observed that nearly one-half of the total area of the holdings is occupied by those possessing from 100 to 300 acres each. The holdings over 300 acres are generally sheep farms, and it is to the enterprise of the medium class of holders that the agricultural progress of Scotland is chiefly due. A society of improvers in the knowledge of agriculture was founded in 1723, but ceased to

exist after the Rebellion of 1745; and the introduction of new and improved methods, where not the result of private enterprise, has been chiefly associated with the efforts of the Highland Society, instituted in 1783, and latterly known as the Highland and Agricultural Society. A great stimulus was also afforded in the beginning of the 19th century by the high prices obtained during the

Land-
lord and
tenant.

Continental wars, and, although periods of occasional severe depression have occurred since then, not only has the science of agriculture continued rapidly to advance but the position of the large farmer has until within recent years been one of increasing prosperity. The system of nineteen years' lease had proved, as regards both agricultural progress and the interests of the farmer, a much superior arrangement to the system of yearly tenancy so largely prevailing in England; but it was conjoined with customs and modified by conditions which during the period of agricultural distress prevailing since 1872 have caused the relations between landlord and tenant to become severely strained. The more prominent grievances of the farmer were the difficulty of obtaining sufficient compensation for improvements, the inconveniences resulting from the law of hypothec (see *HYPOTHEC*, vol. xii. p. 598), and the hardships suffered from the existence of the game laws. Hypothec was abolished in 1879, except as regards the Act of Sederunt; a ground game Act was passed in 1880; and, succeeding the report of the duke of Richmond's commission in 1882, the Agricultural Holdings Act was passed in 1883, containing provisions for securing to the tenant control in the disposition of his lease, and also compensation for improvements; but already it is evident that these reforms have failed to meet the difficulties created by the altered conditions of things, due to the increasing scarcity of land and the importation of foreign produce.

Crofters.

While the relations between the landlord and the large farmer cannot be regarded as satisfactory, the difficulties of the crofters—small holders now chiefly to be found in the western Highlands and the islands to the north and west of Scotland—have reached a more acute stage. The crofter system prevailing in Orkney and Shetland—described in the article on those islands—has a totally different origin from that prevailing in the Highlands. On account of the ancient relations between the Highlander and his chief, the inheritance is claimed by the Highland crofters of an inalienable

right to security of tenure; but when the old feudal system of the Highlands was suddenly abolished after the Rebellion of 1745 no legal steps were taken for the recognition of this right, and from the beginning of the 19th century wholesale clearances of tenants were carried out in many districts even by the heirs of the old Highland chiefs. In the words of the report of the crofters commission of 1884:—"The crofter of the present time has through past evictions been confined within narrow limits, sometimes on inferior land and exhausted soil. He is subject to arbitrary augmentations of money rent, he is without security of tenure, and has only recently received the concession of compensation for improvements." The crofters in Scotland are now estimated to number 40,000 families or 200,000 persons, and many of them support themselves partly by fishing. In the struggle for existence they have had to contend against the tendency towards the creation of large farms, the demand for sporting estates, the desire of landlords to escape the burden of poor rates, and the fact that they have absolutely no choice as regards the conditions imposed on them by the landlord. In March 1883 a commission was appointed to inquire into the condition of the cotters and crofters in the Highlands and islands of Scotland; this commission gave in its report in 1884, and an Act based on their recommendations was passed in 1886.

Notwithstanding the unsatisfactory condition of agricultural affairs in Scotland at present, there is no country in the world in which farming is prosecuted with more skill and enterprise. On crops, account of the great variety of soil and climate the methods in operation differ greatly in different districts, and for special details the reader is referred to the articles on the several counties. The following table (XIII.) shows the cultivated area and the areas under each kind of crop in different years, with the proportion of the acreage under each kind of crop, &c., to every 1000 acres of cultivated land for 1885 in Scotland, England, and Ireland:—

	Yearly Averages.		1880.	1885.	Average per 1000 Acres 1885		
	1867-70.	1871-75.			Scotland.	England.	Ireland.
	Acres.	Acres.			Acres. 1000	Acres. 1000	Acres. 1000
Total acreage under crops, bare fallow, and grass	4,420,375	4,560,825	4,738,127	4,845,805	1000	1000	1000

The earliest year included in this table (1867) is the date at which the agricultural statistics began to be collected and published by the Board of Trade. The work previous to this had been undertaken by the Highland and Agricultural Society of Scotland, but their returns were necessarily less complete and accurate. The return for 1857, for example, gives the arable acreage ("acreage under a rotation of crops") as 3,776,572; but this is clearly too much, as it exceeds that of 1885, and since 1867 there has been a gradual increase. Only a little over one-fourth of the area of Scotland is cultivated, while in England only one-fourth is left uncultivated. It must, however, be taken into consideration that in the agricultural returns "permanent pasture" does not include the mountainous districts which form such a large portion of the surface of Scotland, where heaths and natural grasses occupy the soil and yield a scanty herbage for sheep and cattle. In the return "permanent pasture" is represented as occupying an area little more than a third as large as that occupied by arable land, while in England the two areas are pretty nearly equal, but as a matter of fact pasturage plays a much more important part in the economy of the Scottish than of the English farmer. It will be observed that as regards the main divisions of arable land the total areas under both corn crops and green crops have been slightly decreasing, while there has been a considerable increase in the area under rotation grasses. The following table (XIV.) shows the yield of the principal crops in

1857, 1884, and 1885, with the average yield per acre in the Yield of last two years:—

			1857.	1884.	1885.	Average per Acre	
						1884.	1885.
Wheat ..	Bushels	6,154,986	2,348,261	1,993,501		34.17	34.38
Barley ..	"	7,236,207	7,901,209	8,245,820		34.27	34.72
Oats	"	32,750,768	36,713,321	33,407,127		35.10	31.93
Beans ..	"	1,037,760	705,398	709,577		32.23	30.67
Pease ..	"		38,551	87,464		24.74	21.41
Turnips ..	Tons	6,690,109	7,532,779	6,486,189		15.58	15.39
Potatoes..	"	430,468	986,808	803,523		6.02	5.39

This table being founded on estimates can, of course, only be regarded as approximately correct. The average yield of both wheat and barley is higher than that of England, while the average yield of both oats and potatoes is lower, which may be accounted for by the fact that the first two crops occupy the best soils of Scotland, while the last two occupy every variety of soil in the country. Wheat is grown chiefly in the sea-coast districts and the fertile river-valleys. The area under wheat has declined more than a half since 1867, the combined causes of this being wet seasons and increased foreign competition. Barley, for which the distilleries keep up a steady demand, and oats, the staple crop of the country, have rather increased in area since 1867. The area under potatoes—a very uncertain crop—has rather declined within recent years, and

Live
stock.

that under turnips has considerably declined, partly owing to the increased use of artificial stuffs in cattle-feeding. The following table (XV.) shows the number of live stock in different years, with the average number to every 1000 acres of cultivated land in 1885 in Scotland and England:—

	Yearly Average.		1880.	1885.	Average per 1000 Acres 1885.	
	1867-70.	1871-75.			Scot-land.	Eng-land.
Horses (including ponies)— Used solely for agricultural purposes	138,504	136,689	141,332	141,522	29	30
Unbroken horses and mares kept for breeding	134,307	41,063	52,681	46,770	10	13
Total horses	1172,871	178,652	104,013	188,292	39	43
Cattle— Cows and heifers in milk or in calf	350,509	392,252	387,195	419,210	87	74
Other cattle—two years old and above	249,541	267,920	258,967	260,505	54	43
„ under two years	392,386	467,165	453,124	496,289	102	72
Total cattle	1,022,386	1,127,337	1,099,286	1,176,004	243	189
Sheep— One year old and above	4,582,835	4,735,008	4,651,116	4,560,430	941	407
Under one year old	2,855,142	2,426,114	2,420,972	2,396,762	495	269
Total sheep	6,937,977	7,161,122	7,072,088	6,957,198	1436	676
Pigs	153,939	166,148	120,925	150,984	31	82

This table does not indicate any constant decrease or increase in any of the classes of live stock. It will be observed that the average number of cattle to the acreage of cultivated land in Scotland is about a third more than in England, and of sheep more than double as many; but the number of pigs in England is more than double as many to the acreage of cultivated land as it is in Scotland, and the number of horses is greater. The special breeds of horses in Scotland are the Shetland ponies, the Highland ponies, and the Clydesdale draught horses, the latter originally bred in the Clydesdale district from crossing with Flemish stallions imported about the beginning of the 18th century. The breeds of cattle include the Ayrshire, which, since they are chiefly noted for their yield of milk, and are specially adapted for dairy farms (which prevail especially in the south-west of Scotland), have in a great measure supplanted the Galloway in their native district, except where these are kept for feeding purposes; the polled Angus or Aberdeen, fair milkers, but chiefly valuable for their beef-making qualities, and on this account, as well as their hardihood, in especial favour in the north-east of Scotland, where the art of cattle-feeding has reached its greatest perfection; and the west Highland breed, noted for their long horns, their shagginess, the decided character of their various colours—black, red, dun, cream, and brindle—and their power of thriving on wild and heathy pasture. The special breeds of sheep are the fine-wooled breed, peculiar to Shetland; the blackfaced, native to the Highland districts; and the Cheviots, native to the range of hills of that name, and now the favourite breed in the south of Scotland, although border Leicesters and other English breeds, as well as a variety of crosses, are kept for winter feeding on the lowland farms.

Forests.

The area under orchards as returned on 4th June 1885 was 1892 acres and under nursery grounds 1654. Orchards, chiefly for apples, are most numerous in the Carse of Gowrie and the neighbourhood of Perth, and along the banks of the Clyde above Hamilton. The area under woods in 1812 was 907,695 acres, of which 501,469 acres were natural woods and 406,226 planted; by 1872 it had declined to 734,490, but by 1881 (*i.e.*, by the latest return) it had increased to 829,476, the principal increase having been in Aberdeen, Perth, and Inverness, the counties where the growth of woods is largest. The Board of Trade returns do not distinguish between planted and natural woods, but it is well known that large cuttings have been made in the indigenous forests of the Highlands, while at the same time considerable attention has been paid within the present century to the growth of plantations in the Lowlands, partly as a covert for game; the science of forestry has made great advances within recent years owing to the encouragement and guidance of the Scottish Arboricultural Society, established in 1854, and of the Highland and Agricultural Society. The modern plantations are formed chiefly of Scotch fir with a sprinkling of larch. On the botany of Scotland H. C. Watson's *Topographical Botany* (1883) may be consulted.

Deer
forests,
game,
&c.

According to the report of the crofters commission, the area under deer forests in Scotland is 1,975,209 acres, or about one-tenth of the whole area of the country. The species of deer peculiar to the Scottish Highlands is the red deer; the fallow deer is not uncommon

¹ These figures are for 1870 only.

in the Lowlands, especially in the hilly south-western districts. The grouse moors of Scotland occupy a much more extensive area, and are also much more widely distributed, while they supply sport to a much greater number of persons. Ptarmigan and blackcock are abundant in many districts; and pheasants and partridges, as well as hares, are carefully preserved on many estates in the cultivated districts. Rabbits are common throughout the whole country. Fox-hunting is a fashionable sport in most of the Lowland counties; but otter-hunting has almost died out. The bear, wolf, and beaver, at one time common in Scotland, have become extinct. The last wolf, it is said, was killed by Sir Ewen Cameron of Lochiel in 1680. The wild cat is still to be found in the Highlands, and the polecat, ermine, and pine marten exist in considerable numbers. The golden eagle and the white-tailed eagle tenant the wilder mountainous districts, but other larger birds of prey, as the osprey and the kite, are becoming scarce. In all there are more than 300 species of birds in Scotland, including a great variety of water-fowl in the sea and inland lochs.

Fisheries.—Details regarding the Scottish fisheries will be found Fisheries under FISHERIES (vol. ix. pp. 257-262). The former Board of White Herring Fishery was abolished in 1882 and the Fishery Board of Scotland established, which has devoted more systematic attention to the collection of statistics and the general encouragement of the industry. In 1856 the herring and deep-sea fisheries engaged only about 30,000 persons in Scotland, but in 1884 they employed directly or indirectly 103,804 persons, while the total estimated produce in 1884 was valued at £3,351,848,—the value of cured fish being £2,279,614 (herrings, £2,121,846; cod, ling, and hake dried, £149,407; ditto pickled, £3861); of white fish sold fresh, £716,295 (haddock, £300,712; herrings, £150,720; cod, ling, and hake, £27,443; torsk and saithe, £10,481; whittings, £32,808; sprats, £5232; mackerel, £5286; turbot, £9368; holibut, £17,624; flounders, £47,723; skate, £14,171; soles and other flat fish, £24,727); of shell-fish, £80,939; and of salmon, £275,000.

Mining Industries.—The chief sources of the mineral wealth of Coal. Scotland are coal and iron, which are generally found in convenient juxtaposition. The principal coal-fields are described under COAL (vol. vi. p. 52 sq.). The privilege of digging coal in the lands of Pittencreeff was conferred by charter on the abbot and convent of Dunfermline in 1291, and at a very early period the monks of Newbattle Abbey dug coal from surface-pits on the banks of the Esk. Aeneas Sylvius (afterwards Pope Pius II.), who visited Scotland in the 15th century, refers to the fact that the poor people received at the church doors a species of stone which they burned in place of wood; but, although the value of coal for smith's and artificer's work was early recognized, it was not generally employed for domestic purposes till about the close of the 16th century. In 1606 an Act was passed binding colliers to perpetual service at the works at which they were engaged, and their full emancipation did not take place till 1799. An Act was passed in 1843 forbidding the employment of children of tender years and of women in underground mines. According to the census of 1851, the number of persons engaged in connexion with coal-mining was 36,973 males and 358 females (the latter employed above ground), and in 1881 the numbers were 53,340 and 401. According to the mineral statistics of 1885 there were 69,425 persons employed in the coal-mines of Scotland,—45,082 in the western and 24,343 in the eastern district. The output within twenty years has been more than doubled. In 1854 it was 7,488,000 tons, by 1866 it had increased to 12,034,638, and in 1884 it was 21,186,688.

The rise of the iron industry in Scotland dates from the establishment in 1760 of the Carron ironworks near Falkirk. The number of persons employed in iron-mining in 1851 was 7648, and in iron manufacture 13,296; and by 1881 the numbers had increased respectively to 10,473 and 38,309. The total output of iron ore and ironstone in Scotland in 1884 was 1,885,376 tons, valued at £354,416, less than the estimated amount in 1858, which was 2,312,000 tons, valued at £750,000. There has been no increase in the manufacture of pig-iron since about 1866. The imports of iron ore were 356,380 tons in 1883, valued at £359,918, and in 1884 406,007 tons, valued at £356,451. The production of pig-iron increased with great rapidity after the introduction of railways. In 1796 the quantity produced was 18,640 tons, and in 1830 only 37,500; in 1840 it had risen to 241,000, in 1845 to 475,000, in 1865 to 1,164,000; but in 1884 it was only 988,000, the industry being confined to Ayrshire, Fifeshire, and Lanarkshire. The iron-mills and forges in operation are confined to the last county, there being in 1884 22 works, 334 puddling furnaces, and 82 rolling mills. In 1884 there were 63 open-hearth steelworks in operation, of which 46 were in Glasgow, 10 in Holytown, 4 in Motherwell, and 3 in Wishaw, the quantity made in 1884 being 208,650 tons.

Since about the years 1850-55 shale-mining has become an important industry, especially in Linlithgowshire and Midlothian, mining the total quantity raised in Scotland in 1884 being 1,469,649 tons, valued at £370,924. Lead ore is worked at Abington in Lanarkshire and Wanlockhead in Dumfriesshire; the dressed lead ore obtained amounts to 4327 tons, valued at £34,997, and yielding

3219 tons of lead and 20,011 ounces of silver. The amount of fire-clay dug in 1884 was 463,294 tons, valued at £56,237. Stone quarrying, especially of granite, sandstone, flagstone, slate, and limestone, is extensively carried on, but the returns of the several amounts raised annually are incomplete. The number of persons engaged in quarries in 1881 was 13,742, and the value of the materials raised in 1884 was estimated at £1,030,650. The principal granite works occur in Aberdeenshire and Kirkcudbrightshire, while freestone quarries are common throughout the greater part of the Lowland district, although whinstone also is frequently used for building purposes. Large quantities of paving stones are exported from Caithness and Forfarshire, and there are very extensive slate-quarries at Ballachulish and other places in Argyllshire.

Woollen
cloth.

Manufactures.—Although a company of woollen weavers was incorporated by the town council of Edinburgh in 1475, the cloth worn by the wealthier classes down to the beginning of the 17th century was of English or French manufacture, the lower classes wearing "coarse cloth made at home," in the fashion still prevailing in the remoter districts of the Highlands. In 1601 seven Flemings were brought to Edinburgh by commissioners from the burghs to instruct the people in the manufacture of serges and broadcloth, and eight years later a company of Flemings was established in the Canongate (Edinburgh) for the manufacture of cloth under the special protection of the king; but, notwithstanding also the establishment in 1681 of an English company for the manufacture of woollen fabrics near Haddington, the industry for more than fifty years after this made very tardy progress in the country. In fact its importance dates from the introduction and improvement of machinery in the 19th century. The most important branch of the trade, that of tweeds, first began to attract attention shortly after 1830; though still having its principal seat in the district from which it takes its name, including Galashiels, Hawick, Innerleithen, and Selkirk, it extends to a large number of towns throughout Scotland, especially to Aberdeen, Elgin, Inverness, Stirling, Bannockburn, and Paisley. The chief seat of the hosiery trade is Hawick. Carpet manufacture has had its principal seat in Kilmarnock since 1817, but is also carried on in Aberdeen, Ayr, Bannockburn, Glasgow, Paisley, and other towns. Tartans are largely manufactured in Tillicoultry, Bannockburn, and Kilmarnock, and shawls and plaids are largely manufactured in several towns. In 1850 there were in Scotland 188 woollen and worsted factories, with 233,533 spindles and 247 power-looms, employing 10,210 persons. Twenty-eight years later (1878) the total number of factories was 246, in which there were 559,021 spinning spindles, 62,013 doubling spindles, and 6284 power-looms, the number of persons employed being 22,667, of whom 10,083 were males and 12,584 females.

Linen
and jute.

The manufacture of cloth from flax is of very ancient date in Scotland, and towards the close of the 16th century Scottish linen cloths were largely exported to foreign countries, besides having an extensive sale in England. Regulations in regard to the manufacture were passed in 1641 and 1661. In a petition presented to the privy council in 1684, complaining of the severe treatment of Scotsmen selling linen in England, it was stated that 12,000 persons were engaged in the manufacture. Through the intercession of the secretary of state with the king these restrictions were removed. To further encourage the trade it was enacted in 1686 that the bodies of all persons, with the exception of poor tenants and cotters, should be buried in plain linen only, spun and made within the kingdom. The Act was repeated in 1693 and 1695, and in the former year another Act was passed prohibiting the export of lint and permitting its import free of duty. At the time of the Union the annual amount of linen cloth manufactured in Scotland is supposed to have been about 1,500,000 yards. The Union gave a considerable impetus to the manufacture, as did also the establishment of the Board of Manufactures in 1727, which applied an annual sum of £2650 to its encouragement, and in 1729 established a colony of French Protestants in Edinburgh, on the site of the present Picardy Place, to teach the spinning and weaving of cambric. From 1st November 1727 to 1st November 1728 the amount of linen cloth stamped in Scotland was 2,183,978 yards, valued at £103,312, but by the year ending 1st November 1771 it had increased to 13,672,548 yards, valued at £632,389, during the year ending 1st November 1798 to 21,297,059, valued at £850,405, and by the year ending 1st November 1822, when the regulations as to the inspection and stamping of linen ceased, to 36,268,530 yards, valued at £1,396,296. The counties in which the manufacture is now most largely carried on are Forfar, Perth, Fife, Kinross, and Clackmannan, but Aberdeen, Renfrew, Lanark, Edinburgh, and Ayr are also in a considerable degree associated with it. Dundee is the principal seat of the coarser fabrics, Dunfermline of the table and other finer linens, while Paisley is widely known for its sewing threads. The allied industry of jute is the staple industry of Dundee. The number of persons employed in the flax-factories of Scotland in 1837 was 15,462. The following table (XVI.) gives particulars of these factories for the years 1856, 1867, and 1878:—

Years.	Factories.	Spindles.		Power- Looms.	Persons employed.
		Spinning.	Doubling.		
1856.....	168	278,304		4,011	81,722
1867.....	197	487,579		19,917	77,195
1878.....	155	265,263	18,495	16,756	36,476

Principally owing to foreign competition, the linen manufacture has within recent years been in a very languid condition.

The first cotton-mill in Scotland was built at Rothesay by an Cotton. English Company in 1778. It was soon afterwards acquired by David Dale, who was the agent in Scotland for Arkwright, and had the invaluable aid of his counsel and advice. Dale also established cotton-factories in 1785 at New Lanark, afterwards so closely associated with the socialistic schemes of his son-in-law, Robert Owen, and thus laid the foundation of the industry in the two counties, Lanark and Renfrew, which are now its principal seats in Scotland. Nine-tenths of the cotton-factories of Scotland are now concentrated in Glasgow, Paisley, and the neighbouring towns, but the industry extends into other districts of the west of Scotland and is also represented in the counties of Aberdeen, Perth, and Stirling. The following table (XVII.) gives particulars for 1850, 1861, 1875, and 1885:—

Years.	Factories.	Spindles.	Power Looms.	Persons employed.
1850.....	168	1,633,093	23,564	94,325
1861.....	163	1,915,398	30,110	41,237
1875.....	96	1,711,214	29,171	35,652
1885.....	147	1,149,514	29,684	37,167

For further particulars regarding the manufacture in Scotland, see CORN, vol. vi. pp. 501-503.

Silk is manufactured in Paisley and Glasgow, but the industry Silk, &c. is of minor importance, employing only about 600 persons. Floor-cloth is manufactured at Kirkcaldy, where also the first linoleum factory in Scotland was established in 1877.

Next to textile fabrics, the most important manufacture in Whisky. Scotland is that of whisky, in which it has Ireland for its only competitor. Distillation was introduced into Scotland from England, but by 1771 large quantities of spirits were sent to England from Scotland. The legal manufacture of whisky was greatly checked in the 19th century by occasional excessive advances in the rates of duty, but after the reduction to 2s. 4½d. per gallon in 1823 the number of licensed distillers rapidly increased, while illegal distillation became much less common. The following table (XVIII.) shows the number of gallons made in various years since 1824:—

Year.	Gallons.	Year.	Gallons.	Year.	Gallons.
1824	5,108,373	1855	11,233,636	1878	17,670,460
1840	9,082,353	1865	13,445,752	1884	20,164,962

Ale was a common beverage in Scotland as early as the 12th Beer. century, there being one or more brew-houses attached to every religious house and barony. So important was the use of the beverage even in the beginning of the 18th century that a threatened imposition of a tax on malt in 1725 led to serious riots in Glasgow and a proposal to repeal the Union. Though ale has been superseded by whisky as the national beverage, Scotland still possesses several large breweries, and Edinburgh ales vie in repute with those of Burton-on-Trent. The number of barrels charged with duty in Scotland in 1885 was 1,237,323, the number in England being 24,519,173.

The first sugar-refinery in Scotland was erected in 1765 in Miscel- Greenock, where the industry made rapid progress and has still laneous its principal seat, although it is extensively carried on in Leith indus- and in a lesser degree in Glasgow and Dundee. Glass-making, tries. introduced in 1610 by Sir John Hay at Wemyss in Fife, is now of considerable importance, Edinburgh being celebrated for the finer branches of the manufacture. A paper-mill was erected in 1675 at Dalry Mills on the Water of Leith, in which French workmen were employed to give instruction, with the result, as was reported by the owners, that "grey and blue paper was produced much finer than ever was done before in the kingdom." The most important seat of the industry is now Valleyfield near Penicuik, where it was introduced in 1709. Edinburgh has since the time of the Ballantynes enjoyed a widely-extended fame for the excellence and beauty of its printing. The other manufactures prevailing in different parts of Scotland, such as those of leather, soap, earthenware and hardware, carriages, and the various implements and utensils in general use, do not call for special characterization.

Commerce and Shipping.—That Scotland had a considerable trade Shipping. with foreign countries at a very early period may be inferred from the importation of rich dresses by Malcolm III. and the enjoyment of Oriental luxuries by Alexander I. David I. receives the special praise of Fordun for enriching "the ports of his kingdom with foreign merchandise." In the 13th century the Scots had

acquired a considerable celebrity in shipbuilding; and a powerful French baron had a ship specially built at Inverness in 1249 to convey him and his vassals to the Holy Land. The principal ship-owners at this period were the clergy, who embarked the wealth of their religious houses in commercial enterprises. Definite statements regarding the number and tonnage of shipping are, however, lacking till the 18th century. From two reports printed by the Scottish Burgh Record Society in 1881, it appears that the number of vessels belonging to the principal ports—Leith, Dundee, Glasgow, Kirkcaldy, and Montrose—in 1656 was 58, the tonnage being 8140, and that by 1692 they had increased to 97 of 5905 tons. These figures only represent a portion of the total shipping of the kingdom. At the time of the Union in 1707 the number of vessels was 215 of 14,485 tons. The following table (XIX.) gives the numbers for various years from 1850 :—

	1850.		1860.		1870.		1884.	
	No.	Tons.	No.	Tons.	No.	Tons.	No.	Tons.
Sailing vessels	3432	491,895	3172	552,212	2715	727,942	2065	827,295
Steam vessels	160	30,827	314	71,579	552	209,142	1408	866,780
Total	3601	522,222	3486	623,791	3297	937,084	3468	1,694,075

Table XX. shows the progress of the coasting and foreign trade since 1855 :—

Year.	Coasting.		Colonial and Foreign.		Total.	
	Entered.	Cleared.	Entered.	Cleared.	Entered.	Cleared.
1855	1,968,552	2,057,936	668,078	840,150	3,631,630	2,898,086
1880	6,628,853	5,691,136	2,700,915	3,001,897	9,329,768	8,693,033
1884	7,167,230	6,098,988	3,073,561	3,688,423	10,240,791	9,787,361

Table XXI. shows the great expansion of the foreign and colonial trade since 1755 :—

Year.	Imports.	Exports.	Year.	Imports.	Exports.
1755	£464,411	£585,576	1825	£4,994,804	£5,342,296
1790	1,088,337	1,285,405	1861	8,921,108	5,016,116
1795	1,268,520	976,791	1874	31,012,750	17,912,932
1800	2,312,790	2,340,069	1880	34,997,652	18,348,078
1815	8,447,853	6,997,709	1884	30,600,258	20,322,365

The value of the imports into Scotland is only about a tenth of that of England, but this does not represent the proper proportion of foreign imports used or consumed in Scotland, as large quantities find their way to Scotland from England by rail,—nearly all the tea, for example, consumed in Great Britain being imported into London, while various other ports have almost a monopoly of certain other imports. Reckoning by the combined value of their imports and exports, the principal ports of Scotland are Glasgow, Leith, Greenock, Dundee, Grangemouth, and Aberdeen, in the order named, but for particulars regarding the trade of these and other ports reference must be made to the articles on the several towns.

For many of the most important improvements in the construction of ships, especially steam vessels, Great Britain is indebted to the enterprise and skill of the Clyde shipbuilders. From the time of the construction by Mr Robert Napier of the steamers for the Cunard line, formed in 1840, the shipbuilders on the Clyde have enjoyed an unrivalled reputation for the construction of large ocean steamers, both as regards mechanical appliances and the beauty and convenience of the internal arrangements. Shipbuilding is also carried on to a considerable extent at Dundee, Leith, and Aberdeen, and to a certain degree at most of the ports of the king-

dom, but within recent years the industry has been in a very fluctuating condition, the tonnage of the vessels constructed annually varying between 1880 and 1885 from a little over 100,000 to nearly 300,000.

National Wealth.—The immense increase in the wealth of National Scotland within the last 200 years is sufficiently proved by the fact wealth, that, while in 1674 the valued rent was only £3,656,408 Scots or £304,700 sterling, the gross annual value of the land according to the estimate in the return of 1873 was £18,698,804, or more than sixty times as much, and about fifteen times as great as the proportional increase of population. This increase is of course partly due to agricultural improvements and partly to the discovery and development of the mineral wealth in coal and iron, but it may also be accounted for by the smaller representative value of money, and by the fictitious increase in rents in towns, which does not represent an increase in absolute value. The annual value of real property assessed for income-tax under schedule A in 1843 was £9,481,000; the average value for the three years ending 5th April 1883 was £16,995,718, and for the year ending 5th April 1884 the value was £17,066,705. For the year ending 5th April 1857 the amount of property and income charged with duty was £22,563,288; and during the following twenty-five years it was more than doubled, the average amount for the three years ending 5th April 1883 being £48,069,765, and for the year ending 5th April 1884 £49,600,348. This is less than a tenth of that for the United Kingdom. The total amount of money lying in deposit in savings banks in 1884 was £7,709,471,—about a seventh part of the whole amount deposited in the savings banks of the United Kingdom. Notice of the rise and progress of banking in Scotland will be found under BANKING (vol. iii. pp. 332-336). The total paid-up capital of the Scottish banks at the dates of balance in 1885 was £9,052,000 and their total liabilities £107,882,595.

Education.—Notices of the existence of schools in the principal Element-towns occur as early as the 13th century. They were under the ar-y supervision of the chancellor of each diocese and were chiefly schools. devoted to studies preparatory for the church. Previous to the Reformation schools for general education were attached to many religious houses. In the *First Book of Discipline*, 1560, a comprehensive scheme of general education was propounded, but neither this proposal nor an Act passed in 1616 by the privy council for the establishment of a school in every parish was carried into effect; and the system of parochial schools which prevailed till the passing of the Education Act of 1872 really dates from the Act of William and Mary in 1696 providing for the maintenance of a school in every parish at the cost of the heritors. The various religious secessions in Scotland led to the founding of a large number of denominational and subscription schools, and at the Disruption in 1843 the Free Church made provision for the supply of secular education as well as religious instruction to its adherents. The Education Act of 1872 abolished the old management of the parish schools, and provided for the creation of districts under the management of school boards elected for three years by the ratepayers, male and female. These boards have the power to levy rates for the maintenance and erection of schools for primary instruction, elect the teachers, and enforce the clause in regard to compulsory attendance. The maintenance of schools is also aided by a Government grant, and the salary of the teacher is paid partly by school fees and partly by a grant dependent upon the result of the examination of the scholars by the Government inspector, the school board having the power, however, to make their own terms with the teacher. Denominational schools are permitted to receive a Government grant. The following table (XXII.) shows the proportion of persons in the receipt of education in Scotland in 1861, 1871, and 1881 :—

Year.	Population at different Ages.				Persons in Receipt of Education.				Percentages to the Population at each Age.			
	0-5 years.	5-15 years.	15 and above.	Total.	0-5 years.	5-15 years.	15 and above.	Total.	0-5 years.	5-15 years.	15 and above.	Total.
1861	417,259	685,912	1,959,123	3,052,294	8,666	439,388	19,002	467,056	2-08	64-05	0-96	15-25
1871	455,620	776,871	2,127,527	3,360,018	10,025	541,995	22,101	574,121	2-19	69-77	1-04	17-09
1881	510,591	855,015	2,369,967	3,735,573	14,152	675,814	30,633	720,099	2-77	78-98	1-29	19-28

Particulars in regard to schools under school board management are given in the following table (XXIII.) :—

Year.	Total Expenditure.	Number of Scholars.	School Places.	Schools Inspected.	Expenditure per Scholar on Average Attendance.	Scholars Examined in Higher Subjects.	Certificated Teachers.	Assistant Teachers.	Pupil Teachers.
1875	£551,140	314,164	391,588	2730	£1 15 9½	12,958	3811	129	4262
1884	938,223	458,121	655,672	3181	2 1 5¼	61,429	6220	1012	3629

All the training colleges for teachers in board schools are connected with religious denominations—three with the Established Church, three with the Free Church, and one with the Episcopal Church. As early as the 14th century some of the burghs had grammar-schools partly under the control of the magistrates. In 1496 an

Act was passed enjoining the attendance at the schools of the eldest sons of barons and freeholders until "they be founded in perfect Latin, and thereafter to remain at the schools of arts and law" (where ecclesiastics were trained). The grammar or burgh schools enjoyed a monopoly of teaching certain branches, and private schools were frequently prohibited as interfering with their rights. Grammar-schools were chiefly devoted to instruction in Latin, and the course usually extended to five years. According to the report of the education commissioners, the number of burgh schools in 1867 was twenty-six. By the Act of 1872 their management was transferred to the school board, but they were excluded from participation in the school fund, and no provision was made for their inspection. The Act of 1878 authorized certain grants of money, and contained certain provisions for inspection, which, however, have been practically inoperative. The Educational Endowments Act of 1882 provides for a more comprehensive scheme for the

promotion of secondary education, and also for a scheme of systematic inspection. These educational endowments—the result of private bequest—yield an annual income of £175,000, and, on account of the changed conditions of society, the primary objects of the donors were in a great degree frustrated by the manner in which they were being administered. Some of the best secondary schools in Scotland are under the management of trustees. For the four universities of Scotland (St Andrews, Aberdeen, Glasgow, and Edinburgh) see the articles on these cities, also **UNIVERSITIES**. University College in Dundee and Anderson's College in Glasgow have similar courses of instruction to the universities, but possess no power to grant degrees and receive no Government aid. A notice of the various medical schools and scientific colleges will be found in the articles on the towns in which they are situated.

Religion.—For an historical account of the more important religious denominations of Scotland the reader is referred to the articles **SCOTLAND, CHURCH OF, FREE CHURCH OF SCOTLAND, UNITED PRESBYTERIAN CHURCH, and PRESBYTERIANISM**. The bulk of the population is Presbyterian, and the following table (XXIV.) gives particulars reported in 1885 regarding the Church of Scotland and other churches originated by secessions from it at various times,—the “contributions” indicating the amounts raised by the churches for all purposes, and of course excluding the endowments of the Established Church:—

	Church of Scotland.	Free Church.	U.P. Church.	Evang. Union.	Original Seceders.	Reformed Presby.
Congregations ..	1,479	1,067	543	87	27	12
Members	565,261	329,541	177,517	18,210	9349	1037
Contributions ..	£306,431	£626,028	£387,355	£21,760	£5606	£2592

The Roman Catholic Church has 327 “churches, chapels, and stations,”—the estimated population connected with it being over 340,000. The Episcopal Church in Scotland has about 250 churches with 80,000 members (of all ages) and nearly 30,000 communicants. The churches in connexion with the Congregational Union number 101, 73 of which report a membership of 10,869, the money raised for all purposes in 1884-85 being £23,027. The Baptist Union has 88 churches with 9688 members; and the Wesleyan Methodists have 26 “circuits” with 4653. There are a few other religious denominations, such as the Primitive Methodists, the Catholic Apostolic Church, and the Glassites, but the membership of each is comparatively small.

Government, Law, and Local Administration.—By the Act of Union in 1707 Scotland ceased to have a separate parliament and its government was assimilated to that of England. In the parliament of Great Britain its representation was fixed at sixteen peers (the same number as at present) elected by the peers of Scotland at each new parliament, in the House of Lords, and at forty-five members in the House of Commons,—the counties returning thirty and the burghs fifteen. The power of the sovereign to create new Scottish peerages lapsed at the Union, and their number has already diminished by nearly one-half. By the Reform Act of 1832 the number of Scottish representatives in the Commons was raised to fifty-three, the counties under a slightly altered arrangement returning thirty members as before, and the burghs, reinforced by the erection of various towns into parliamentary burghs, twenty-three; the second Reform Act (1868) increased the number to sixty, the universities obtaining representation by two members, while three additional members were assigned to the counties and two to the burghs; by the Redistribution of Seats Act of 1885 an addition of six members was made to the representation of the counties and six to that of the burghs, the total representation being raised to seventy-two. The management of Scottish business in parliament has since 1885 been under the charge of the secretary for Scotland.

Law. At the Union Scotland retained its old system of law and legal administration, a system modelled on that of France; but since the Union the laws of England and Scotland have been on many points assimilated, the criminal law of the two countries being now practically identical, although the methods of procedure are in many respects different. The Court of Session, as the supreme court in civil causes is called, dates from 1532, and was formed on the model of the parlement of Paris; it is held at Edinburgh, the capital. Since the Union it has undergone certain modifications. It consists of thirteen judges, acting in an Inner and an Outer House. The Inner House has two divisions, with four judges each, the first being presided over by the lord president of the whole court, and the second by the lord justice clerk. In the Outer House five judges, called lords ordinary, sit in separate courts. Appeals may be made from the lords ordinary to either of the divisions of the Inner House, and, if the occasion demands, the opinion of all the judges of the Court of Session may be called for; but whether this be done or not the decision is regarded as a decision of the Court of Session. Appeals may be made from the Court of Session to the House of Lords. The lord justice general (lord president), the lord justice clerk, and five other

judges form the High Court of Justiciary, instituted in 1672, for criminal cases, which sits at Edinburgh for the trial of cases from the three Lothians and of cases referred from the circuit courts. The latter meet for the south at Jedburgh, Dumfries, and Ayr; for the west at Glasgow, Inveraray, and Stirling; and for the north at Perth, Aberdeen, Dundee, and Inverness. The law agents who undertake cases to be decided before the supreme courts are either solicitors before the supreme courts or writers to the signet, the latter of whom possess certain special privileges. The lawyer authorized to plead before the supreme courts is termed an advocate. The principal law officer of the crown is the lord advocate, who is assisted by the solicitor-general and by advocates-depute. The lord advocate has since 1885 ceased to have the charge of Scottish business in the House of Commons. See **ADVOCATE**, vol. i. 178. The subordinate legal courts and officials are described under the next heading.

The largest administrative area is that of the county, but for Local purposes of registration Scotland is partitioned into eight divisions, administered by an examiner for inspection of registers is appointed by the registrar-general; and for the carrying out of the provisions of the Lunacy Acts it is divided into twenty-two districts. Registration counties date from the Act of 1854 providing that for purposes of registration the areas of the counties may be altered. For the purposes of the General Police Act of 1862 part of the area of one county may also be brought into the area of another. Certain counties have been united for parliamentary or other purposes, and certain others have been divided for parliamentary purposes, while others again for certain administrative purposes retain their old subdivisions, Lanark for assessment purposes being still divided into wards. The civil counties were originally synonymous either with sheriffdoms or stewartries. Stewartries ceased with the abolition of hereditary jurisdictions in 1748, but Kirkcudbright still retains the designation. The office of sheriff, which formerly implied a much less limited authority than at present, was in existence in the reign of David I., when the greater part of the kingdom was divided into twenty-five sheriffdoms. In the latter part of the 13th century they numbered thirty-four. The counties now number thirty-three, of which Ross and Cromarty constitute one, while Edinburgh is a “county of a city.” The highest county dignity is the lord-lieutenant, the office being instituted in 1782. He is nominated by the crown, holds office for life, except in cases of misconduct, represents the crown in military matters, recommends for commissions of the peace, holds the position of high sheriff, and is a member of the police committee. Practically, however, the office is little more than honorary, and the real administration of county affairs is in the hands of commissioners of supply, who were originally appointed to apportion and collect the national revenue, but who now regulate the land-tax, control the county police, raise the militia, and levy rates to meet the county expenditure. In 1878 an Act was passed for the creation of road trustees, who have the power to levy rates for the maintenance throughout the county of roads and bridges (see p. 530 above). The practical administration of the law in the county is under the control of the sheriff. See **SHERIFF**. A large proportion of his duties are, however, delegated to the sheriff-substitute. At one time the functions of the sheriff-principal were confined to one county, but by an Act passed in 1855 it was arranged that as sheriffdoms fell vacant certain counties should be grouped into districts, each under the control of one sheriff-principal, and in 1870 this arrangement was further modified and extended. The sheriff-clerk, appointed by the crown, has, under the Ballot Act of 1872, the charge of ballot papers in connection with the parliamentary elections, and is *custos rotulorum*. The public prosecutor for counties is the procurator-fiscal, who takes the initiative in regard to suspected cases of sudden death, although in this respect the law of Scotland is less strict than that of England. Justices of the peace, who are unpaid and require no special qualification, but who, as they are recommended by the lord-lieutenant, are generally persons of position in the county, exercise a certain subordinate jurisdiction. Their office expires on the demise of the crown. In every commission of the peace certain public officials are included. The justices of the peace hold quarter sessions, take affidavits and declarations (such as declarations of marriage), sign warrants, try petty criminal cases (such especially as poaching and assault), and regulate public-house licences. Under **BOROUGH** (vol. iv. pp. 63-64) will be found an account of the history and constitution of the three classes of ancient burghs in Scotland,—royal burghs, burghs of regality, and burghs of barony. Police burghs, which may include any of the other classes of burghs, are formed of those places which have adopted the General Police and Improvement Acts (13 and 14 Vict. c. 33 and 25 and 26 Vict. c. 101). They are governed by police commissioners, who have power to regulate all sanitary matters. They may include more than one of the other burghs and may extend into another county. Under the Improvement Act (25 and 26 Vict. c. 101) most of the burghs with over 7000 inhabitants maintain their own police. The parliamentary burghs do not now include all the royal burghs and include various other towns in addition to them. The number of royal

burghs is seventy, and, as was to be expected, while some since their formation have enormously increased in population and wealth, others have so declined or made so little progress that they now rank only as villages. In 1881 there were ten royal burghs which had less than 1000 inhabitants each and four which had less than 500 each, Earlsferry (Fife) having only 286. Under the Public Health Act of 1867, amended in 1879, the erection of urban and rural sanitary districts was provided for. The corporation of the burghs is formed of the provost (or lord provost), bailies, and councillors. Bailie courts are held in the burghs for the trial of minor offences. The civil parish or parish *quoad omnia*, originally the ecclesiastical parish or area subject to one cure of souls, is a division of the county for registration of births, deaths, and marriages and for poor law administration. The boundaries are determined by the boundaries of the estates which appear to lie in the parish, but may be altered by consent of proprietors holding the major value of the property in it. For all sanitary purposes the areas of burghs are removed from those of the parishes, and

certain civil parishes may be classed as burghal, landward, and mixed. Under Graham's Act (7 and 8 Vict. c. 44) a parish *quoad sacra* may be erected on the application of persons who have built and endowed a church. For administrative purposes the oldest parish organization is that of the heritors or landowners, who are required to provide and maintain a church, churchyard, manse, and church glebe, and, before the passing of the Education Act in 1872, had to maintain the parochial school. In 1579 the power was granted them of assessment for poor relief, but in 1600 the kirk-session was united with them for these purposes. This organization still exists in those parishes, now very few in number, which have not adopted the Poor Law Amendment Act of 1845; this Act provides for the constitution of a parochial board composed of nominees of the kirk-session and a proportion of persons elected by the ratepayers. Under the Education Act of 1872 the county is divided into school-board districts, whose area corresponds with the civil, or the *quoad sacra*, or landward, or burghal parish (see p. 534 above). (T. F. H.)

SCOTLAND, CHURCH OF. In the article PRESBYTERIANISM the history of the Church of Scotland was brought down to the middle of the 18th century, and the story of the secessions of 1733 and 1751 was there told. We take up here the church's history at the beginning of the "Moderate" rule. Her annals during the next three-quarters of a century are singularly uneventful. In close alliance with the state, she increases in power and dignity, and becomes the home of letters and philosophy. But there is no great movement of a theological nature, no striking religious development to lend her popular interest.

The strength of the church as well as her tendency to moderation arose in great part out of the political circumstances of the early part of the 18th century. Presbyterianism, being loyal to the house of Hanover, while Episcopacy was Jacobite, enjoyed the royal favour and was treated as a firm ally of the Government. The Patronage Act of 1712 threw the filling up of parishes into the hands of those well-affected to the Government, and the example of the mode of patronage practised in England may have tended to promote a disregard of the religious feelings of the people. The effect on the clergy was to encourage them to seek the friendship of the landed gentry and to regard the higher rather than the lower orders of society as their natural allies, so that they were at the same time led to liberal ways of thinking and rendered largely independent of their congregations.

It is remarked by Dr Hill Burton, and Carlyle repeats the remark, that "Scots dissent never was a protest against the principles of the church, but always tended to preserve the old principles of the church, whence the Establishment—by the progress of enlightenment as some said, by deterioration according to others—was lapsing." The secessions carried off the more fervent elements; yet enough of the old leaven always remained to exert a powerful influence. Thus, while the church as a whole was more peaceful, more courtly, more inclined to the friendship of the world than at any former time, it contained two well-marked parties, in one of which these characteristics of the religion of the 18th century were more marked than in the other. The Moderate party, which maintained its ascendancy till the beginning of the 19th century, and impressed its character on the church, sought to make the working of the church in its different parts as systematic and regular as possible, to make the assembly supreme and enforce respect for its decisions by presbyteries, and to render the judicial procedure of the church as exact and formal as that of the civil courts. The popular party, regarding the church less from the side of the Government, had less sympathy with the progressive movements of the age, and desired greater strictness in discipline. The main subject of dispute arose at first from the exercise of patronage. Presbyteries in various parts of the country were still disposed to disregard the presentations of lay patrons, and to settle the men desired by the people; but legal decisions

Period of Moderate ascendancy.

Question of patronage.

had shown that if they acted in this way their nominee, while legally minister of the parish, could not claim the stipend. To the risk of such sacrifices the church, led by the Moderate party, refused to expose herself. By the new policy inaugurated by Dr Robertson, which led to the second secession, the assembly compelled presbyteries to give effect to presentations, and in a long series of disputed settlements the "call," though still held essential to a settlement, was less and less regarded, until it was declared that it was not necessary, and that the church courts were bound to induct any qualified presentee. The substitution of the word "concurrency" for "call" about 1764 indicates the subsidiary and ornamental light in which the assent of the parishioners was now to be regarded. The church could have given more weight to the wishes of the people; she professed to regard patronage as a grievance, and the annual instructions of the assembly to the commission (the committee representing the assembly till its next meeting) enjoined that body to take advantage of any opportunity which might arise for getting rid of the grievance of patronage, an injunction which was not discontinued till 1784. It is not likely that any change in the law could have been obtained at this period, and disregard of the law might have led to an exhausting struggle with the state, as was actually the case at a later period. Still it was in the power of the church to give more weight than she did to the feelings of the people; and her working of the patronage system drove large numbers from the Establishment. A melancholy catalogue of forced settlements marks the annals of the church from 1749 to 1780, and wherever an unpopular presentee was settled the people quietly left the Establishment and erected a meeting-house. In 1763 there was a great debate in the assembly on the progress of schism, in which the popular party laid the whole blame at the door of the Moderates, while the Moderates rejoined that patronage and Moderatism had made the church the dignified and powerful institution she had come to be. In 1764 the number of meeting-houses was 120, and in 1773 it had risen to 190. Nor was a conciliatory attitude taken up towards the seceders. The ministers of the Relief desired to remain connected with the Establishment, but were not suffered to do so. Those ministers who resigned their parishes to accept calls to Relief congregations, in places where forced settlements had taken place, and who might have been and claimed to be recognized as still ministers of the church, were deposed and forbidden to look for any ministerial communion with the clergy of the Establishment. Such was the policy of the Moderate ascendancy, or of Principal Robertson's administration, on this vital subject. It had the merit of success in so far as it completely established itself in the church. The presbyteries ceased to disregard presentations, and lay patronage came to be regarded as part of the order of things. But the growth of dissent steadily continued and excited alarm from time to time; and it may be questioned whether the peace of the church was not purchased at too high a price. The Moderate period is justly regarded as in some respects the most brilliant in the history of the church. Her clergy included many distinguished Scotsmen, of whom an account is given under their respective names. See REID (Thomas), CAMPBELL (George), FERGUSON (Adam), HOME (John), BLAIR (Hugh), ROBERTSON (William), and ERSKINE (John). The labours of these men were not mainly in theology; in religion the age was one not of advance but of rest; they gained for the church a great and widespread respect and influence.

Another salient feature of the Moderate policy was the consolidation of discipline. It is frequently asserted that discipline was lax at this period and that ministers of scandalous lives were allowed to continue in their charges. It cannot, however, be shown that the leaders of the church

at this time sought to procure the miscarriage of justice in dealing with such cases. That some offenders were acquitted on technical grounds is true; it was insisted that in dealing with the character and status of their members the church courts should proceed in as formal and punctilious a manner as civil tribunals and should recognize the same laws of evidence, in fact, that the same securities should exist in the church as in the state for individual rights and liberties.

The religious state of the Highlands, to which at the Re-
 period of the Union the Reformation had only very par-
 tially penetrated, occupied the attention of the church dur-
 ing the whole of the 18th century. In 1725 the gift called
 the "royal bounty" was first granted,—a subsidy amounting
 at first to £1000 per annum, increased in George IV.'s reign
 to £2000, and continued to the present day; its original
 object was to assist the reclamation of the Highlands from
 Roman Catholicism by means of catechists and teachers.
 The Society for Propagating Christian Knowledge, incor-
 porated in 1709, with a view partly to the wants of the
 Highlands, worked in concert with the Church of Scotland,
 setting up schools in remote and destitute localities, while
 the church promoted various schemes for the dissemination
 of the Scriptures in Gaelic and the encouragement of Gaelic
 students. In consequence of these efforts Roman Catho-
 licism now lingers only in a few islands and glens on the
 west coast. In these labours as well as in other directions
 the church was sadly hampered by poverty. The need of an
 increase in the number of parishes was urgently felt, and,
 though chapels began to be built about 1796, they were pro-
 vided only in wealthy places by local voluntary liberality;
 for the supply of the necessities of poor outlying districts no
 one as yet looked to any agency but the state. In every part
 of the country many of the ministers were miserably poor;
 there were many stipends, even of important parishes, not
 exceeding £40 a year; and it was not till after many debates
 in the assembly and appeals to the Government that an Act
 was obtained in 1810 which made up the poorer livings to
 £150 a year by a grant from the public exchequer. The
 churches and manse were frequently of the most miserable
 description, if not falling to decay.

With the close of the 18th century a great change passed
 over the spirit of the church. The new activity which
 sprang up everywhere after the French Revolution pro-
 duced in Scotland a revival of Evangelicalism which has
 not yet spent its force. Moderatism had cultivated the
 ministers too fast for the people, and the church had
 become to a large extent more of a dignified ruler than a
 spiritual mother. About this time the brothers Robert
 and James Haldane devoted themselves to the work of pro-
 moting Evangelical Christianity, James making missionary
 journeys throughout Scotland and founding Sunday schools;
 and in 1798 the eccentric preacher Rowland Hill visited
 Scotland at their request. In the journals of these evan-
 gelists dark pictures are drawn of the religious state of the
 country, though their censorious tone detracts greatly from
 their value; but there is no doubt that the efforts of the
 Haldanes brought about or coincided with a quickening
 of the religious spirit of Scotland. The assembly of 1799
 passed an Act forbidding the admission to the pulpits of
 laymen or of ministers of other churches, and issued a
 manifesto on Sunday schools. These Acts helped greatly to
 discredit the Moderate party, of whose spirit they were the
 outcome; and that party further injured their standing
 in the country by attacking Leslie, afterwards Sir John
 Leslie, on frivolous grounds,—a phrase he had used about
 Hume's view of causation—when he applied for the chair of
 mathematics in Edinburgh. In this dispute, which made
 a great sensation in the country, the popular party suc-
 cessfully defended Leslie, and thus obtained the sympathy of

the enlightened portion of the community. In 1810 the *Christian Instructor* began to appear under the editorship of Dr Andrew Thomson, a churchman of vigorous intellect and noble character. It was an ably written review, in which the theology of the Haldanes asserted itself in a somewhat dogmatic and confident tone against all unsoundness and Moderatism, clearly proclaiming that the former things had passed away. The question of pluralities began to be agitated in 1813, and gave rise to a long struggle, in which Dr Chalmers took a notable part, and which terminated in the regulation that a university chair or principalship should not be held along with a parish which was not close to the university seat.

The growth of Evangelical sentiment in the church, along with the example of the great missionary societies founded in the end of the 18th and the beginning of the 19th century, led to the institution of the various missionary schemes still carried on, and their history forms the chief part of the history of the church for a number of years. The education scheme, having for its object the planting of schools in destitute Highland districts, came into existence in 1824. The foreign mission committee was formed in 1825, at the instance of Dr Inglis, a leader of the Moderate party; and Dr Duff went to India in 1829 as the first missionary of the Church of Scotland. The church extension committee was first appointed in 1828, and in 1834 it was made permanent. The colonial scheme was inaugurated in 1836, and the Jewish mission in 1838, M'Cheyne and Andrew Bonar setting out in the following year as a deputation to inquire into the condition of the Jews in Palestine and Turkey and on the Continent of Europe. Of these schemes that of church extension has most historical importance. It was originally formed to collect information regarding the spiritual wants of the country, and to apply to the Government to build the churches found to be necessary. As the population of Scotland had doubled since the Reformation, and its distribution had been completely altered in many counties, while the number of parish churches remained unchanged, and meeting-houses had only been erected where seceding congregations required them, the need for new churches was very great. The application to Government for aid, however, proved the occasion of a "Voluntary controversy," which raged with great fierceness for many years and has never completely subsided. The union of the Burgher and the Antiburgher bodies in 1820 in the United Secession—both having previously come to hold Voluntary principles—added to the influence of these principles in the country, while the political excitement of the period disposed men's minds to such discussions. The Government built forty-two churches in the Highlands, providing them with a slender endowment; and these are still known as parliamentary churches. Under Dr Chalmers, however, the church extension committee struck out a new line of action. That great philanthropist had come to see that the church could only reach the masses of the people effectively by greatly increasing the number of her places of worship and abolishing or minimizing seat-rents in the poorer districts. In his powerful defence of establishments against the voluntaries in both Scotland and England, in which his ablest assistants were those who afterwards became, along with him, the leaders of the Free Church, he pleaded that an established church to be effective must divide the country territorially into a large number of small parishes, so that every corner of the land and every person, of whatever class, shall actually enjoy the benefits of the parochial machinery. This "territorial principle" the church has steadily kept in view ever since. With the view of realizing this idea he appealed to the church to provide funds to build a large number of new churches, and personally

carried his appeal throughout the country. By 1835 he had collected £65,626 and reported the building of sixty-two churches in connexion with the Establishment. The keenness of the conflict as it approached the crisis of 1843 checked the liberality of the people for this object, but by 1841 £305,747 had been collected and 222 churches built.

The zealous orthodoxy of the church found at this period several occasions to assert itself. M'Leod Campbell, minister of Row, was deposed by the assembly of 1830 for teaching that assurance is of the essence of faith and that Christ died for all men. He has since been recognized as one of the profoundest Scottish theologians of the 19th century, although his deposition has never been removed. The same assembly condemned the doctrine put forth by Edward Irving, that Christ took upon Him the sinful nature of man and was not impeccable, and Irving was deposed five years later by the presbytery of Annan, when the outburst of supposed miraculous gifts in his church in London had rendered him still more obnoxious to the strict censures of the period. In 1841 Wright of Borthwick was deposed for a series of heretical opinions, which he denied that he held, but which were said to be contained in a series of devotional works of a somewhat mystical order which he had published.

The influence of dissent also acted along with the rapidly rising religious fervour of the age in quickening in the church that sense of a divine mission, and of the right and power to carry out that mission without obstruction from any worldly authority, which belongs to the essential consciousness of the Christian church. An agitation against patronage, the ancient root of evil, and the formation of an anti-patronage society, helped in the same direction. The Ten Years' Conflict, which began in 1833 with the passing by the assembly of the Veto and the Chapel Acts, is treated in the article FREE CHURCH OF SCOTLAND. It is not therefore necessary to dwell further in this place on the consequences of those Acts. The assembly of 1843, from which the exodus took place, proceeded to undo the Acts of the church during the preceding nine years. The Veto was not repealed but ignored, as having never had the force of law; the Strathbogie ministers were recognized as if no sentence of deposition had gone forth against them. The protest which the moderator had read before leaving the assembly had been left on the table; and an Act of Separation and deed of demission were received from the ministers of the newly formed Free Church, who were now declared to have severed their connexion with the Church of Scotland. The assembly addressed a pastoral letter to the people of the country, in which, while declining to "admit that the course taken by the seceders was justified by irresistible necessity," they counselled peace and goodwill towards them, and called for the loyal support of the remaining members of the church.

Two Acts at once passed through the legislature in answer to the claims put forward by the church. The Scottish Benefices Act of Lord Aberdeen, 1843, gave the people power to state objections personal to a presentee, and bearing on his fitness for the particular charge to which he was presented, and also authorized the presbytery in dealing with the objections to look to the number and character of the objectors. Sir James Graham's Act, 1844, provided for the erection of new parishes, and thus created the legal basis for a scheme under which chapel ministers might become members of church courts.

The Disruption left the Church of Scotland in a sadly maimed condition. Of 1203 ministers 451 left her, and among these were many of her foremost men. A third of her membership is computed to have gone with them. In Edinburgh many of her churches were nearly empty. The Gaelic-speaking population of the northern counties com-

pletely deserted her. All her missionaries left her but one. She had no gale of popular enthusiasm to carry her forward, representing as she did not a newly arisen principle but the opposition to a principle which she maintained to be dangerous and exaggerated. For many years she had much obloquy to endure. But she at once set herself to the task of filling up vacancies and recruiting the missionary staff. A lay association was formed, which raised large sums of money for the missionary schemes, so that their income was not allowed seriously to decline. The good works of the church, indeed, were in a few years not only continued but extended. All hope being lost that parliament would endow the new churches built by the church extension scheme of Dr Chalmers, it was felt that this also must be the work of voluntary liberality. Under Dr James Robertson, professor of church history in Edinburgh, one of the leading champions of the Moderate policy in the Ten Years' Conflict, the extension scheme was transformed into the endowment scheme, and the church accepted it as her duty and her task to provide the machinery of new parishes where they were required. By 1854 30 new parishes had been added at a cost of £130,000, and from this time forward the work of endowment proceeded still more rapidly. In 1860 61 new parishes had been endowed, in 1870 150, in 1876 250, while in 1886 there were 351.¹ In 1843 the number of parishes was 924. Of 42 parliamentary churches existing at that time 40 have been erected into parishes *quoad sacra*; hence the total number of parishes in Scotland at midsummer 1886 was 1315. By the Poor Law Act of 1845 parishes were enabled to remove the care of the poor from the minister and the kirk-session, in whom it was formerly vested, and to appoint a parochial board with power to assess the ratepayers. The Education Act of 1872 severed the ancient tie connecting church and school together, and created a school board having charge of the education of each parish. At that date the Church of Scotland had 300 schools, mostly in the Highlands. The church, however, continues to carry on normal schools for the training of teachers in Edinburgh, Glasgow, and Aberdeen.

Abolition of patronage. In 1874 patronage was abolished. The working of Lord Aberdeen's Act had given rise to many unedifying scenes and to lengthy struggles over disputed settlements, and it was early felt that some change at least was necessary in the law. The agitation on the subject went on in the assembly from 1857 to 1869, when the assembly by a large majority condemned patronage as restored by the Act of Queen Anne, and resolved to petition parliament for its removal. The request was granted, and the right of electing parish ministers was conferred on the congregation; thus a grievance of old standing, from which all the ecclesiastical troubles of a century and a half had sprung, was removed and the church placed on a thoroughly democratic basis. This Act, combined with various efforts made within the church for her improvement, has secured for the Scottish Establishment a large measure of popular favour, and during the last quarter of a century she has grown rapidly both in numbers and in influence. This revival is largely due on the one hand to the improvement of her worship which began with the efforts of Dr Robert Lee (1804-1868), minister of Old Greyfriars, Edinburgh, and professor of Biblical criticism in Edinburgh university. By introducing into his church a printed book of prayers

Improvements in public worship.

¹ Those branches of the church extension scheme which dealt with church building, and with the opening of new missions to meet the wants of increasing populations, were taken up by a new department, called the home mission scheme. The home mission as the pioneer in opening up new fields of labour, and the endowment scheme which renders permanent the religious centres that the mission has founded, are both traceable to Dr Chalmers.

and also an organ Dr Lee stirred up vehement controversies in the church courts, which resulted in the recognition of the liberty of congregations to improve their worship. A church service society, having for its object the study of ancient and modern liturgies, with a view to the preparation of forms of prayer for public worship, was founded in 1865; it has published five editions of its "Book of Common Order," which, though at first regarded with suspicion, is now recognized as a useful and respected adjunct. Church music has been cultivated and improved in a marked degree; a fine collection of hymns has been introduced to supplement the psalms and paraphrases. And architecture has restored the larger churches from their disfigurement by partition walls and galleries—though much still remains to be done in this way—and has erected new churches of a style favourable to devotion.

The fervour of the church has, on the other hand, found a channel in the operations of a "Committee on Christian Life and Work," appointed in 1869 with the aim of exercising some supervision of the work of the church throughout the country, stimulating evangelistic efforts, and organizing the labours of lay agents. This committee publishes a magazine of "Life and Work," which has a circulation of about 100,000, and has lately been seeking to organize young men's guilds in connexion with congregations. It was to reinforce this element of the church's activity, as well as to strengthen her generally, that Mr James Baird in 1873 made the munificent gift of £500,000. This fund is administered by a trust which is not under the control of the church, and the revenue is used mainly in aid of church building and endowment throughout the country.

Committee on Christian Life and Work.

The church has greatly increased of late years in liberality of sentiment, and there has been no deposition for heresy since 1843. A volume of *Scotch Sermons* published in 1880 by ministers holding liberal views brought out the fact that the church would not willingly be led into such prosecutions. An agitation on the part of the Dissenters for disestablishment sprang up afresh after the passing of the Patronage Act and has continued ever since; while a counter-movement was represented by a Bill, introduced into parliament in 1886 to declare the spiritual independence of the Church of Scotland, which, if successful, would, it was understood, have opened the way for a reunion of the Presbyterian bodies.²

Church Membership.—The Church of Scotland has now (1886) Statistics 1315 parishes, 160 non-parochial churches, and 121 preaching and of mission stations, in all 1596 charges. The number of presbyteries is 84, and there are 16 provincial synods. The general assembly &c. consists of 252 clerical and 118 lay members elected by presbyteries, with 73 representatives of royal burghs and universities, and 4 representatives of churches abroad, in all 447 members. In 1873 the number of communicants as returned to parliament in 1874 was 460,526; in 1878 the number as returned to parliament in 1879 was 515,786; in 1883 the number returned to the assembly of 1884 was 543,969; in 1885, 564,435. The professors of divinity at the four Scottish universities must be ministers of the church, and students aspiring to the ministry are required to attend one of the divinity halls of the universities for three sessions, after an arts course of three years. A large number of ministers of the church are employed elsewhere than in Scotland. The Church of Scotland in England consists of 16 charges. There are 31 chaplains ministering to Presbyterians in the army and navy, 15 of these being stationed in India. The foreign mission employs 15 ordained and 11 unordained European missionaries, with a large number of native agents, in India, East Africa, and China. The Jewish mission employs 6 ordained ministers, with other agents, at Constantinople, Smyrna, Salonica, Beyrout, and Alexandria. The colonial committee supplies religious ordinances to emigrants from Scotland in India, Fiji, Cyprus, Mauritius, Ceylon, and the West Indies, besides assisting Presbyterian colleges in Canada and Australia. A minister of the church presides over a Scots church of old standing at Amsterdam. Two lectureships have been founded in recent times in connexion with the church—one by Mr James Baird (already mentioned),

² For the period since 1843 the most useful book is Dr Story's *Life of Dr Robert Lee*, 1870.

the other by Mr John Croall of Southfield—and these have already produced several notable contributions to Scottish theology.

An association for augmenting the smaller livings was formed in 1866, and the church now has a smaller livings scheme, which aims at bringing up to £200 a year all livings that fall below that sum. Such numbered 311 in 1885; and the sum distributed among them was £8537, which, however, was £5000 short of the sum necessary to accomplish fully the desired object.

In the following details of the income of the church we give first the value of her endowments and then some figures showing the growth of her voluntary liberality.

Finance. *Means from Endowments.*—(1) From a parliamentary return obtained in 1874 the church is seen to derive from teinds, including the value of manse and glebes, the annual sum of £289,413. Augmentations have been obtained since that date amounting to upwards of £10,000, but the fiars prices have declined during the same period by nearly 25 per cent., so that the total amount so derived has not increased. The unexhausted teinds amounted in 1880 to £134,413. (2) The exchequer pays to 190 poor parishes and to 42 Highland churches, from church property in the hands of the crown, £17,040. (3) From local sources the church derives £23,501. (4) The endowments raised by the church for 842 new parishes amount to £42,500. The total endowments, not counting church buildings, amount to £383,041.

Means from Voluntary Liberality.—The following table (I.) gives a view of the financial progress of certain of the schemes of the church since the secession:—

Year.	Foreign Mission.	Education.	Colonial Scheme.	Jewish Mission.	Home Mission.
1842	£6,748	£3630	£3,753	£4298	..
1845	3,572	3688	2,481	1867	£2,615
1850	6,047	4019	2,707	2472	3,587
1855	3,712	4466	3,060	2619	3,866
1860	4,873	4487	3,228	2804	4,858
1865	5,822	4952	3,696	3280	5,389
1870	7,754	8245	4,684	4101	7,082
1875	12,315	9035	8,371	5644	11,163
1880	16,270	..	11,674	4715	15,604
1885	13,346	..	4,750	5128	9,450

No attempt was made until 1873 to collect statistics of the whole liberality of the church; and changes introduced from time to time in the mode of stating the various sums make it impossible to give a complete comparative statement since that date. The following table (II.) shows the amount at quinquennial periods down to 1885, the church-door collections and seat-rents probably affording the most accurate indication of the general progress of the body. The building operations of which the values are given include only such building as is the result of voluntary effort. Under the head of "general church objects" are included the collections for missions, for small livings, aged and infirm ministers, zenana missions, &c. These figures do not include income from trust funds or endowments; they state what was given in the year referred to. A number of objects of liberality are not included in the table.

Year.	Church-door Collections.	Seat Rents.	Church or Manse Building or Repairs.	General Church Objects.	Other Objects.	Total.
1872	£41,561	£35,225	£31,851	£43,618	£27,224	£255,350
1877	65,827	53,094	69,800	40,117	54,572	373,715
1882	76,399	59,859	67,184	51,520	61,253	388,061
1885	80,887	63,197	59,395	60,110	61,789	374,576

The following sums were raised during the thirteen years 1872-84:—congregational and charitable purposes, £1,462,091; support of ordinances and supplement of stipends, £233,406; education (exclusive of sums raised for training colleges), £161,931; home mission work, £358,543; church building, £737,775; endowment of new parishes, £486,693; foreign mission work, £376,523; total, £3,816,962. Mr James Baird's gift is not included in this statement. (A. M*.)

SCOTLAND, LITERATURE OF. Literature in Scotland, as distinct from England, dates from the time of COLUMBA (*q.v.*). Adamnan, abbot of Iona, who in 690 wrote in Latin the life of his predecessor, may be regarded as the first author that Scotland produced. In addition to his biography of St Columba, a long extract from a work of his on the "Holy Places" is incorporated by Bede in his *Ecclesiastical History*. The greater part of Scotland was at that time inhabited by a Celtic population and the period from the 7th to the 13th century has left but few literary remains (see *CELTIC LITERATURE*, vol. v. p. 313). In the latter part of the 13th century what may be called the ancient literary language of Scotland was used in the district between the Humber and the Forth and coastwise as

far north as Aberdeen. Its earliest writer is Thomas of Ercildoune, or Thomas the Rhymer, who reached the height of his fame in 1280. The fairy tale or romance that bears his name may be regarded as the earliest example of romance poetry in Britain. Nearly contemporary with the Rhymer were two other distinguished Scots, Michael Scot (*q.v.*) and John of Duns, or DUNS SCOTUS (*q.v.*), both of whom, however, wrote in Latin. Three Arthurian Arthurian romances taken from Anglo-Norman sources relating to Sir Gawain, one of the most celebrated knights of the Round Table, seem to have been composed about the end of the 13th century. These were—*Syr Gawain and the Grene Knycht*, the *Knighly Tale of Golagros and Gawayne*, and the *Awntyrs of Arthur at the Ternewathelgme*. Sir Gawain's exploits were so popular in the south of Scotland that he was claimed by the people as one of their own chieftains and called the lord of Galloway. The *Awntyrs of Arthur*, or the adventures of King Arthur at the Tervewadling, a small lake near Carlisle, and the *Pystil of Swete Susan*, a version of the apocryphal story of Susanna, are supposed to have been the productions of Sir Hew of Eglintoun about that period. The *Taill of Rauf Coilze*, in which the adventures of the emperor Charlemagne in the house of a charcoal-burner named Ralph in the neighbourhood of Paris are related with much poetic humour, and the fairy tale of *Orfeo and Heurodis* were written in the early part of the 14th century and were very popular in Scotland in former times.

The War of Independence gave a new impetus to Scottish nationality and produced a corresponding effect on the literature of the country. The *Brus*, or metrical account of the deeds of Robert Bruce, was written by John BARBOUR (*q.v.*), archdeacon of Aberdeen, in the latter part of the 14th century. To him we owe a translation of a mediæval romance on the *Trojan War*, nearly 3000 lines in length, and a large collection of metrical lives of saints, which, after being long preserved in manuscript, have recently been printed by Dr Horstmann. About this time was compiled the first formal history of Scotland by John of FORDUN (*q.v.*), which was written in Latin and brought Fordun down to the death of David I. He, however, left materials for the completion of the work, the last date of which is 1385. In 1441 a continuation of it was made by Walter Bower or Bowmaker. The whole work was then styled Bower. the *Scotichronicon*, and brings the history of Scotland down to 1437. A metrical history was written between 1420 and 1424 by Andrew of Wyntoun, a canon regular of St Wyn-Andrews and prior of St Serf's Inch in Loch Leven. This town. work, known as the *Orygynale Cronykil of Scotland*, is prefaced by an account of the human race from the creation, and, although for the most part its verse is homely and dull, its author occasionally describes stirring incidents with considerable power. The beautiful poem of James I. James I. called *The Kingis Quhair*, written about this period, was far in advance of the contemporary metrical chronicles. It possesses a melody of verse unknown before and gives the king a conspicuous place in early Scottish literature. He is supposed to have also written *A Ballad of Good Counsel* and a song *On Absence*; but two poems, *Christis Kirk of the Grene* and *Peblis to the Play*, believed to have been his composition, have been recently shown by the Rev. W. W. Skeat to be by some other early poet. An allegorical poem called the *Buke of the Howlat* was written about 1450 by Sir Richard Holland, an adherent of the noble family of Douglas. It is a warning against pride, exemplified by the owl, decked out in the splendour of borrowed feathers, compelled on account of his insolence to resume his original form. The poem displays some inventive and descriptive power, though marred by its alliteration. The exploits of Sir William Wallace found

Blind Harry.

about 1460 a worthy chronicler in Henry the Minstrel, or Blind Harry, who, born with such a serious defect, must be regarded as one of the most extraordinary individuals recorded in the annals of literature. His well-known poem, which bears the name of his hero, is in versification, expression, and poetic imagery a remarkable production for that period. The grave and thoughtful poetry of Robert HENRYSON (*q.v.*), notary public and preceptor in the Benedictine convent at Dunfermline, who flourished about 1470, contrasts favourably with that of his English contemporaries. His *Testament of Cresseid* was often incorporated in the old editions of the works of Chaucer, to whose poetry it is not inferior. His *Robene and Makyne* is the earliest specimen of pastoral poetry in the Scottish language. These, with his *Fables* and other works, entitle him to a high place amongst the early Scottish poets. Nearly coeval with Henryson was Sir Gilbert Hay, chamberlain to Charles VI. of France, who made several translations from the works of French authors. One of these, taken from a popular French romance of Alexander the Great, extends to upwards of 20,000 lines. A long anonymous poem called *Clariodius* belongs to this period. It is a romance founded on a French original, the more material incidents of which are supposed to have happened at the English court. It abounds with illustrations of the manners and customs peculiar to the age of chivalry. Being nearly 3000 lines in length, it is, like the last-mentioned, an extensive specimen of the language and versification of the time. The *Thrie Tales of the Thrie Preistis of Peblis* (1490), the authorship of which is unknown, are moral tales possessing considerable freshness. As a fragment of an old version of them occurs in the Asloan MS., written in 1490, they must have existed long before the edition printed by Henry Charteris in 1603, in which form only they are now accessible. The *Ledger* of Andrew Halyburton, conservator of the privileges of the Scottish nation in the Netherlands, 1492-1503, is a valuable source of information regarding the early trade of Scotland.

Dunbar.

The close of the 15th century exhibited a considerable growth of literary ability in the writings of William DUNBAR (*q.v.*) and his contemporaries. His works were so highly esteemed at the time he wrote that he was raised to the dignity of "the makar" or poet-laureate of Scotland. Such of Dunbar's writings as have come down to the present time are of a miscellaneous character, in which there is much power of description and command of verse. The *Thistle and the Rose* and the *Golden Targe* are excellent specimens of his poetic power. His satirical poems, such as the *Twa Mariit Wemen and the Wedo* and the *Flying with Kennedie*, contain much coarse humour. Seven of his poems were the first specimens of Scottish typography, having been printed by Chepman and Myllar at Edinburgh in 1508, followed in 1509 by the well-known *Breviary* for the church of Aberdeen. A humorous poem called the *Freiris of Berwik* has been attributed to Dunbar and is usually printed with his works. Contemporary with Dunbar were a number of minor Scottish poets, of whose works only a few specimens have come down to the present time. These were Walter Kennedie, with whom he had his "flying" or poetical contest, Sir John Rowll, Quintyne Shaw, Patrick Johnestoun, Merseir, James Afflek, and others.¹ The most classical of the Scottish poets was Gawyn or Gavin DOUGLAS (*q.v.*), bishop of Dunkeld, whose great literary work was the translation of the *Æneid* of Virgil into Scottish verse. To each book he prefixed a prologue;

Gavin Douglas.

the one before the twelfth is an admirable descriptive poem of the beauties of May. His *Palice of Honour* and *Kyng Hart*, two allegorical poems, are able productions, the latter of which is full of dramatic vigour. Contemporary with Douglas was Sir David LYNDSEY (*q.v.*), Lyon king-of-arms Sir in the reign of James V., who may be regarded as the most popular of the early Scottish poets. His *Monarchie, or ane Dialog betwix Experience and ane Courteour of the Miserabyl Estait of the Warld* gives a short survey of sacred and classical history which rendered it very popular in its time. His *Satire of the Thrie Estaitis* is a skilfully written attempt to reform the abuses of the period, especially those of the church. While some of its characters recite long and erudite political speeches, he introduces interludes of a farcical kind suited to the tastes of the times. This work may be considered the first dramatic effort of any British author. In his *Testament of Squire Meldrum* he relates the adventures of his hero with much poetic fire. Lyndsay's other poems consist of appeals to the king for advancement and some *jeux d'esprit* of no great length. One of the best scholars and teachers of this period was John Major or Mair, a native of Haddington, who was principal of St Salvator's College, St Andrews. Besides being the author of learned commentaries on Aristotle, he wrote a well-known work, *De historia gentis Scotorum libri sex*, printed in 1521. Another Scottish author that wrote in Latin with considerable elegance was Hector BOECE (*q.v.*), principal of King's College, Aberdeen. Boece. His great work, *Historia gentis Scotorum a prima gentis origine*, was published in Paris in 1526. It was translated into Scottish by John Bellenden, archdeacon of Moray, under the title of the *Hystory and Cronikkis of Scotland*, printed at Edinburgh in 1536. Bellenden also translated the first five books of Livy into Scottish. The *Chronicle* of Boece was versified in Scottish in 1531-35 by William Stewart, a descendant of the first earl of Buchan. It was written by command of Margaret, sister of Henry VIII. of England, for the instruction of her son, the youthful James V. A Latin work of much merit, entitled *De animi tranquillitate*, was published in 1543 by Florence Wilson, master of Carpentras School. It is in the form of a dialogue and displays much variety of knowledge, while its Latinity has long been celebrated. In an anonymous work, written in 1548 or 1549, and called the *Complaynt of Scotland*, the author deplores the calamities to which Scotland was then subject. These are stated to be the wrongs done to the Scottish labourers at the hands of the landholders and the clergy, the difficulties with England, and the treachery of the Scottish nobility. The work is valuable as affording a glimpse of the literature then popular in Scotland, some pieces of which are no longer to be found,—such as *The Tayle of the Reyde Eyttym* [red giant] *with the Thre Heydes*, *The Tayl of the Volfe of the Varldis End*, *The Tayl of the Gantis that eit Quyk Men*, *The Tayl of the thrie fittit Dog of Norroway*, and *Robyn Hude and Litil Thone*.

In 1552 there was printed at St Andrews a *Catechism, that is to say ane Commone and Catholike Instruction of the Christian People in Materis of our Catholike Faith and Religion*, written by John Hamilton, archbishop of St Andrews, the last primate of the Roman Catholic faith in Scotland. The poems of Sir Richard Maitland, which are Mait. of a somewhat satirical kind, are valuable, as they, like those of Lyndsay, contain much information about the abuses of the time (1560), such as the oppressive conduct of the landholders, vexatious lawsuits, and the depredations of the Border thieves. Sir Richard deserves the thanks of posterity for the large manuscript collection of poems by Scottish authors which he and his daughter formed, and which is now preserved in the Pepysian Library, at Magdalene College, Cambridge. The name of George

¹ Kennedie wrote *The Praise of Aige* and *The Passioun of Christ*; Rowll, *The Cursing on the Steilaris af his Fowlis*; Shaw, *Advice to a Courtier*; Johnestoun, *The Thrie Deid Powis*; Merseir, *Perrell in Paramours*; and Afflek, *The Quair of Jelousy*.

- Bannatyne.** Bannatyne is inseparably connected with the history of Scottish poetry, as in 1568 he too formed an extensive collection of Scottish poetry which is certainly the most valuable now extant. It was written by him at Edinburgh in the time of the plague, when the dread of infection confined him closely at home. The *Bannatyne MS.* now preserved in the Advocates' Library extends to 800 pages folio, and includes several of Bannatyne's own poems, of which the two most considerable are of an amatory character. The works of Alexander Scott, consisting principally of love poems, embrace also a spirited account of a *Jousting betwix Adamson and Sym* at the Drum, a place a little to the south of Edinburgh. The author, who was one of the most elegant poets of this period, has sometimes been called the "Scottish Anacreon." Two poems of some merit—the *Praises of Women* and the *Miseries of a Pair Scholar*—were written by Alexander Arbuthnot, principal of King's College, Aberdeen, about 1570. A poem of considerable length, called the *Sege of the Castell of Edinburgh*, published in 1573, was by Robert Semple, who also wrote an attack on Archbishop Adamson, called the *Legend of the Bishop of Sanct Androis Lyfe*.
- Rolland.** To this period belong two poems of considerable length—the *Court of Venus* (1575), an imitation of the *Palice of Honour* of Gawyn Douglas, and the romance of the *Seaven Seages* (1578), a Scottish version of one of the most remarkable mediæval collections of stories belonging to the same class as the *Arabian Nights*, in which one single story is employed as a means of stringing together a multitude of subsidiary tales. These poems were written by John Rolland, notary in Dalkeith. One of the best Latin scholars that modern Europe has produced was George BUCHANAN (*q.v.*), who flourished in the middle of the 16th century. He wrote several Latin tragedies and an unrivalled translation of the Psalms. His *De jure regni apud Scotos* was composed to instruct James VI., to whom he had been tutor, in the duties belonging to his kingly office. His last and most important labour was his *History of Scotland*, originally printed in 1582, of which seventeen editions have appeared. An excellent specimen of the ancient vernacular language is the *Chronicle of Scotland* by Robert Lyndsay of Pittscottie. It includes the period from 1436 to the marriage of Mary to Darnley in 1565. Although its author was a simple-minded and credulous man, he describes events of which he was an eye-witness with circumstantiality and great prolixity of detail. Another historical work of greater importance was the *De origine, moribus, et rebus gestis Scotorum* (1578) by John Lesley, bishop of Ross. A translation of this work made by Father James Dalrymple, a religious in the Scottish cloister of Ratisbon, 1596, is in course of publication by the Rev. Father E. B. Cody for the Scottish Text Society. Lesley also wrote in Scottish a *History of Scotland* from the death of James I. in 1436 to the year 1561. This work, intended for the perusal of Mary while in captivity in England, is written in an elegant style. The bishop was the champion of that unfortunate queen, and in 1569 wrote a *Defence of the Honour of Marie Quene of Scotland and Dowager of France*, with a declaration of her right, title, and interest to the succession of the crown of England.
- The Reformation exerted a considerable influence on Scottish literature. Amongst the earliest Protestant writers of the country may be mentioned Alexander Ales or Alesius, a native of Edinburgh, who published several controversial works and commentaries on various parts of the Bible.
- Knox.** But the most eminent promoter of the reform was John KNOX (*q.v.*), who wrote several controversial pamphlets and some religious treatises; his great work was the *History of the Reformation of Religion in Scotland*, first printed in 1586. One of the principal opponents of Knox was Ninian Winzet, a priest of considerable ability and one familiar Winzet, with the scholastic learning of the age. He began life as master of Linlithgow school and subsequently became abbot of St James's at Ratisbon. He wrote several tracts in which he strenuously recommended the observance of certain popish festivals. In 1562 he published his *Buke of Four Scoir Thrie Questions tuching Doctrine, Ordour, and Maneris proponit to the Prechouris of the Protestantis in Scotland and deliverit to Thone Knox the 20th day of February 1562*. The writings of James VI., who was a James man of scholarly attainments, embrace several works both VI. in poetry and prose. His earliest production, published in 1584, when he was only eighteen, was the *Essays of a Prentice in the Divine Art of Poesie*. This was followed by his poetical *Exercises at Vacant Houres* (1591). He also wrote a great many sonnets and a translation of the Psalms. His prose works are *Dæmonologie* (1597), *Βασιλικὸν Δῶρον* (1599), *Counterblast to Tobacco*, *Paraphrase on Revelation*, *Law of Free Monarchies*, &c. Among the Scottish poets who frequented his court were William Fowler, the elegant translator of the *Triumphs* of Petrarch, and Stewart of Baldinnies (Perth), a translator of Ariosto. Both these poets wrote other works which exist in MS., but are still unpublished. The zeal of Sir David Lyndsay Reli- and others for the reformation of the church initiated a gious religious revival, and in 1597 was published the collection Poets. known as *Ane Compendious Booke of Godly and Spiritual Sangs for avoiding of Sinne and Harlotrie*. This very curious work is attributed to John and Robert Wedderburn, the latter of whom was vicar of Dundee. A number of religious poems were written about the end of the 16th century by James Melville, minister of Anstruther, afterwards of Kilrenny, both in Fife. His *Morning Vision*, printed in 1598, consists of paraphrases of the Lord's Prayer, the Shorter Catechism, and the Ten Commandments. He also wrote the *Black Bastel*, a lamentation over the Church of Scotland, which is dated 1611. Another religious poet was James Cockburn, a native of Lanarkshire, who wrote *Gabriel's Salutation to Marie* (1605), and some other poems not destitute of merit. An eminent theological writer of this era, Robert Rollock, first principal of the university of Edinburgh, wrote many commentaries on the Scriptures which show extensive learning. Most are in Latin; but one or two are in the Scottish language. A very popular poem, the *Cherrie and the Slae*, first printed Mont- by Waldegrave at Edinburgh in 1597, afterwards went gomerie. through many editions. Its author was Alexander Montgomerie, who also wrote some translations of the Psalms and the *Flyting betwixt Montgomerie and Polwarth*, in imitation of Dunbar's *Flyting with Kennedie*. In 1599 was published an interesting volume of poems written by Alexander Hume, entitled *Hymnes or Sacred Songs, wherein the Right Use of Poesie may be espied*. One is on the defeat of the Spanish Armada. To the beginning of the 17th century belongs a comedy in rhyming stanza, the authorship of which is unknown,—*Ane verie Excellent and Delectabill Treatise intituled Philotus, quhairin we may perceive the Greit Inconveniences that fallis out in the Marriage betwix Aige and Youth* (1603). Its versification is easy and pleasant, and its plan a nearer approximation to the modern drama than the satire of Lyndsay. In the same year appeared the poems of Sir William ALEXANDER (*q.v.*), earl of Stirling. Sir One, called *Doomsday*, or the *Great Day of the Lord's Judgment*, consists of 11,000 verses. His *Monarchieke Tragedies*, four in number, were not intended for representation on the stage. His exhortation or *Parænesis to Prince Henry* (1604) is his best poem. He also wrote *Recreations with the Muses* (1637), which is of a somewhat philosophical character. One of the most distinguished writers of this era was William DRUMMOND (*q.v.*) of Hawthornden, who

Drummond of Hawthornden.

Hannay.

Mathematicians.

Philosophers.

Writers on jurisprudence.

Medical writers.

published *Poems, amorous, funerall, divine, pastorall* (1616), and *Flowers of Zion, or Spiritual Poems* (1623). He also wrote a *History of Scotland during the Reigns of the Five Jameses* (1655), some political tracts, and the *Cypress Grove*, a moral treatise in prose. As a writer of sonnets he has always been highly esteemed. Nearly contemporary with Drummond was Patrick Hannay, a native of Galloway, who seems to have followed James to England. He published his poems in 1622, the principal of which are *Philomela the Nightingale* and *Sheretrine and Mariana*. He occupies a favourable position amongst the minor Scottish poets. After the removal of the Scottish court to London and the union of the crowns in 1603, the old language began to be considered as a provincial dialect; and the writers subsequent to Drummond, who was the first Scottish poet that wrote well in English, take their places amongst British authors.

To the short sketch above given may be added a notice of the early Scottish writers on mathematics, philosophy, jurisprudence, and medicine. In mathematical science the name of Joannes Sacro Bosco (John Holywood or Holybush) may be mentioned, as he is believed to have been a native of Nithsdale and a canon of the monastery of Holywood, from which he took his name. He flourished about the beginning of the 13th century, and his treatise *De Sphæra Mundi* was very generally taught in colleges and schools. The system of astronomy and the other mathematical treatises of James Bassantie, who taught at Paris about 1560 with much success, were celebrated in their time. The greatest of the Scottish mathematicians, however, was John NAPIER (*q.v.*) of Merchiston, who wrote on various kindred subjects, and in 1614 astonished the world by his discovery of logarithms. In philosophy, besides the voluminous works of Duns Scotus and John Major already mentioned, various learned commentaries on Aristotle, of which Scottish philosophy then almost entirely consisted, were published by Robert Balfour, principal of the college of Guienne; by John Rutherford, professor of philosophy at St Andrews (under whom Admirable Crichton was a pupil); and by James Cheyne, professor of philosophy at Douai. In jurisprudence a celebrated treatise on the *Feudal Law* was written by Sir Thomas Craig about 1608. It was not, however, published till about half a century after his death, as the printing of any treatise on the law of Scotland while he lived seems to have been considered as out of the question. Commentaries on some of the titles of the *Pandects* of Justinian, and a treatise *De Potestate Papæ* (1609), in opposition to the usurpation of temporal power by the pope, were written by William Barclay, professor of law in the university of Angers. Another early legal work was a treatise *On the Connexion between Government and Religion*, by Adam Blackwood, judge of the parlement of Poitiers, who was the antagonist of Buchanan and a strenuous defender of Mary queen of Scots. In medicine the principal early Scottish works were written by Duncan Liddell, a native of Aberdeen, who in 1605 published at Helmstädt his *Disputationes medicinales*, containing the theses or disputations maintained by himself and his pupils from 1592 to 1606. He also published other works, which contain an able digest of the medical learning of his age. Henry Blackwood, dean of faculty to the college of physicians at Paris, wrote various treatises on medicine, of which a list will be found in Mackenzie's *Lives of the Scottish Writers*, but which are now only historically interesting. (J. SM.)

SCOTT, DAVID (1806-1849), historical painter, was born at Edinburgh in October 1806, and studied under his father, Robert Scott, an engraver of repute in the city. For a time in his youth he occupied himself with the burin; but he soon turned his attention to original work in colour, and in 1828 he exhibited his first oil picture, the *Hopes of Early Genius dispelled by Death*, which was followed by *Cain, Nimrod, Adam and Eve singing their Morning Hymn*, *Sarpedon carried by Sleep and Death*, and other subjects of a poetic and imaginative character. In 1829 he became a member of the Scottish Academy, and in 1832 visited Italy, where he spent more than a year in study. At Rome he executed a large symbolical painting, entitled the *Agony of Discord, or the Household Gods Destroyed*. On his return to Scotland he continued the strenuous and unwearied practice of his art; but his productions were too recondite and abstract in subject ever to become widely popular, while the defects and exaggerations of their draftsmanship repelled connoisseurs. So the

gravity which had always been characteristic of the artist passed into gloom; he shrank from society and led a secluded life, hardly quitting his studio, his mind constantly occupied with the great problems of life and of his art. The works of his later years include *Vasco da Gama encountering the Spirit of the Storm*, a picture—immense in size and most powerful in conception—finished in 1842, and now preserved in the Trinity House, Leith; the Duke of Gloucester entering the Water Gate of Calais (1841), an impressive subject, more complete and harmonious in execution than was usual with the artist; the Alchemist (1838), Queen Elizabeth at the Globe Theatre (1840), and Peter the Hermit (1845), remarkable for their varied and elaborate character-painting; and *Ariel and Caliban* (1837) and the *Triumph of Love* (1846), distinguished by their beauty of colouring and depth of poetic feeling. The most important of his religious subjects are the Descent from the Cross (1835) and the Crucifixion—the Dead Rising (1844). In addition to his works in colour Scott executed several remarkable series of designs. Two of these—the Monograms of Man and the illustrations to Coleridge's *Ancient Mariner*—were etched by his own hand, and published in 1831 and 1837 respectively, while his subjects from the *Pilgrim's Progress* and Nichol's *Architecture of the Heavens* were issued after his death. Among his literary productions are five elaborate and thoughtful articles on the characteristics of the Italian masters, published in *Blackwood's Magazine*, 1839 to 1841, and a pamphlet on *British, French, and German Painting*, 1841. He died in Edinburgh on the 5th of March 1849. As a colourist David Scott occupies a high place in the Scottish school, but the most distinctive merit of his works lies in the boldness of their conception and their imaginative and poetic power.

See W. B. Scott, *Memoir of David Scott, R.S.A.* (1850), and J. M. Gray, *David Scott, R.S.A., and his Works* (1884).

SCOTT, SIR GEORGE GILBERT (1811-1878), one of the most successful ecclesiastical architects of the 19th century, was born in 1811 at Gawcott near Buckingham, where his father was rector; his grandfather was Thomas Scott (1747-1821), the well-known commentator on the Bible. In 1827 young Scott was apprenticed for four years to an architect in London named Edmeston, and at the end of his pupilom acted as clerk of the works at the new Fishmongers' Hall and other buildings in order to acquire a knowledge of the practical details of his profession. In Edmeston's office he became acquainted with a fellow-pupil, named Moffat, a man who possessed considerable talents for the purely business part of an architect's work, and the two entered into partnership. In 1834 they were appointed architects to the union workhouses of Buckinghamshire, and for four years were busily occupied in building a number of cheap and ugly unions, both there and in Northamptonshire and Lincolnshire. In 1838 Scott built at Lincoln his first church, won in an open competition, and this was quickly followed by six others, all very poor buildings without chances; that was a period when church building in England had reached its very lowest point both in style and in poverty of construction. About 1839 his enthusiasm was aroused by some of the eloquent writings of Pugin on mediæval architecture, and by the various papers on ecclesiastical subjects published by the Camden Society. These opened a new world to Scott, and he thenceforth studied and imitated the architectural styles and principles of the Middle Ages with the utmost zeal and patient care. The first result of this new study was his design for the Martyrs' Memorial at Oxford, erected in 1840, a clever adaptation of the late 13th-century crosses in honour of Queen Eleanor. From that time Scott became the chief ecclesiastical architect in

England, and in the next twenty-eight years completed an almost incredibly large number of new churches and "restorations," the fever for which was fomented by the Ecclesiological Society and the growth of ecclesiastical feeling in England.

In 1844 Scott won the first premium in the competition for the new Lutheran church at Hamburg, a noble building with a very lofty spire, designed strictly in the style of the 13th century. In the following year his partnership with Moffat was dissolved, and in 1847 Scott was employed to renovate and refit Ely cathedral, the first of a long series of English cathedral and abbey churches which passed through his hands. In 1851 Scott visited and studied the architecture of the chief towns in northern Italy, and in 1855 won the competition for the town-house at Hamburg, designed after the model of similar buildings in north Germany. In spite of his having won the first prize, another architect was selected to construct the building, after a very inferior design. In 1856 a competition was held for designs of the new Government offices in London; Scott obtained the third place in this, but the work was afterwards given to him on the condition (insisted on by Lord Palmerston) that he should make a new design, not Gothic, but Classic or Renaissance in style. This Scott very unwillingly consented to do, as he had little sympathy with any styles but those of England or France from the 13th to the 15th century. In 1862-63 he was employed to design and construct the Albert Memorial, a very costly and elaborate work, in the style of a magnified 13th-century reliquary or ciborium, adorned with many statues and reliefs in bronze and marble. On the partial completion of this he received the honour of knighthood. In 1866 he competed for the new London law-courts, but the prize was adjudged to his old pupil, G. E. Street. In 1873, owing to illness caused by overwork, Scott spent some time in Rome and other parts of Italy. The mosaic pavement which he designed for Durham cathedral soon afterwards was the result of his study of the 13th-century mosaics in the old basilicas of Rome. On his return to England he resumed his professional labours, and continued to work almost without intermission till his short illness and death in 1878. He was buried in the nave of Westminster Abbey, and an engraved brass, designed by G. E. Street, was placed over his grave. In 1838 Scott married his cousin, Caroline Oldrid, who died in 1870; they had five sons, two of whom have taken up their father's profession.

Scott's architectural works were more numerous than those of any other architect of the century; unfortunately for his fame, he undertook far more than it was possible for him really to design or supervise with thought and care. He carried out extensive works of repair, refurnishing, and restoration in the following buildings:—the cathedrals of Ely, Hereford, Lichfield, Salisbury, Chichester, Durham, St David's, Bangor, St Asaph, Chester, Gloucester, Ripon, Worcester, Exeter, Rochester, the abbeys of Westminster, St Albans, Tewkesbury, and countless minor churches. He also built the new Government offices (India, Foreign, Home, and Colonial), the Midland Railway terminus and hotel, and a large number of private houses and other buildings. His style was (with the one exception of the Government offices) a careful copy of architectural periods of the Middle Ages, used with a profound knowledge of detail, but without much real inventive power, and consequently rather dull and uninteresting in effect. As a "restorer" of ancient buildings he was guilty of an immense amount of the most irreparable destruction, but any other architect of his generation would probably have done as much or even more harm. While a member of the Royal Academy Scott held for many years the post of professor of architecture, and gave a long series of able lectures on mediæval styles, which were published in 1879. He wrote a work on *Domestic Architecture*, and a volume of *Personal and Professional Recollections*, which, edited by his eldest son, was published in 1879, and also a large number of articles and reports on many of the ancient buildings with which he had to deal. Owing to his numerous pupils, among whom have been many leading architects, his influence was for some time very widely spread; but it is now rapidly passing away, mainly owing to the growing reaction against the somewhat

narrow mediævalism of which he, both in theory and practice, was the chief exponent.

SCOTT, JOHN. See ELTON, EARL OF.

SCOTT, MICHAEL. See SCOT, MICHAEL.

SCOTT, SIR WALTER (1771-1832), poet and novelist, was born at Edinburgh on 15th August 1771. His pedigree, in which he took a pride that strongly influenced the course of his life, may be given in the words of his own fragment of autobiography. "My birth was neither distinguished nor sordid. According to the prejudices of my country it was esteemed *gentle*, as I was connected, though remotely, with ancient families both by my father's and mother's side. My father's grandfather was Walter Scott, well known by the name of *Beardie*. He was the second son of Walter Scott, first laird of Raeburn, who was third son of Sir William Scott, and the grandson of Walter Scott, commonly called in tradition *Auld Watt* of Harden. I am therefore lineally descended from that ancient chieftain, whose name I have made to ring in many a ditty, and from his fair dame, the Flower of Yarrow,—no bad genealogy for a Border minstrel."

Scott's desire to be known as a cadet of the house of Harden, and his ruling passion—so disastrous in its ultimate results—to found a minor territorial family of Scotts, have been very variously estimated. He himself, in a notice of John Home, speaks of pride of family as "natural to a man of imagination," remarking that, "in this motley world, the family pride of the north country has its effects of good and of evil." Whether the good or the evil preponderated in Scott's own case would not be easy to determine. It tempted him into courses that ended in commercial ruin; but throughout his life it was a constant spur to exertion, and in his last years it proved itself as a working principle capable of inspiring and maintaining a most chivalrous conception of duty. If the ancient chieftain Auld Watt was, according to the anecdote told by his illustrious descendant, once reduced in the matter of live stock to a single cow, and recovered his dignity by stealing the cows of his English neighbours, Professor Veitch is probably right in holding that Scott's Border ancestry were, as a matter of literal fact, sheep-farmers, who varied their occupation by "lifting" sheep and cattle, and whatever else was "neither too heavy nor too hot." The Border lairds were really a race of shepherds in so far as they were not a race of robbers. Professor Veitch suggests that Scott may have derived from this pastoral ancestry an hereditary bias towards the observation of nature and the enjoyment of open-air life. He certainly inherited from them the robust strength of constitution that carried him successfully through so many exhausting labours. And it was his pride in their real or supposed feudal dignity and their rough marauding exploits that first directed him to the study of Border history and poetry, the basis of his fame as a poet and romancer. His father, a writer to the signet (or attorney) in Edinburgh—the original of the elder Fairford in *Redgauntlet*—was the first of the family to adopt a town life or a learned profession. His mother was the daughter of Dr Rutherford, a medical professor in the university of Edinburgh, who also traced descent from the chiefs of famous Border clans. The ceilings of Abbotsford display the arms of about a dozen Border families with which Scott claimed kindred through one side or the other. His father was conspicuous for methodical and thorough industry; his mother was a woman of imagination and culture. The son seems to have inherited the best qualities of the one and acquired the best qualities of the other.

The details of his early education are given with great precision in his autobiography. Stuart Mill was not more minute in recording the various circumstances that shaped

his habits of mind and work. We learn from himself the secret—as much at least as could be ascribed to definite extraneous accident—of the “extempore speed” in romantic composition against which Carlyle protested in his famous review of Lockhart’s *Life of Scott*.¹ The indignant critic assumed that Scott wrote “without preparation”; Scott himself, as if he had foreseen this cavil, is at pains to show that the preparation began with his boyhood, almost with his infancy. The current legend when Carlyle wrote his essay was that as a boy Scott had been a dunce and an idler. With a characteristically conscientious desire not to set a bad example, the autobiographer solemnly declares that he was neither a dunce nor an idler, and explains how the misunderstanding arose. His health in boyhood was uncertain;² he was consequently irregular in his attendance at school, never became exact in his knowledge of Latin syntax, and was so belated in beginning Greek that out of bravado he resolved not to learn it at all.

Left very much to himself throughout his boyhood in the matter of reading, so quick, lively, excitable, and uncertain in health that it was considered dangerous to press him and prudent rather to keep him back, Scott began at a very early age to accumulate the romantic lore of which he afterwards made such splendid use. As a child he seems to have been an eager and interested listener and a great favourite with his elders, apparently having even then the same engaging charm that made him so much beloved as a man. Chance threw him in the way of many who were willing to indulge his delight in stories and ballads. Not only his own relatives—the old women at his grandfather’s farm at Sandyknowe, his aunt, under whose charge he was sent to Bath for a year, his mother—took an interest in the precocious boy’s questions, told him tales of Jacobites and Border worthies of his own and other clans, but casual friends of the family—such as the military veteran at Prestonpans, old Dr Blacklock the blind poet, Home the author of *Douglas*, Adam Ferguson the martial historian of the Roman republic—helped forward his education in the direction in which the bent of his genius lay. At the age of six

he was able to define himself as “a virtuoso,” “one who wishes to and will know everything.” At ten his collection of chap-books and ballads had reached several volumes, and he was a connoisseur in various readings. Thus he took to the High School, Edinburgh, when he was strong enough to be put in regular attendance, an unusual store of miscellaneous knowledge and an unusually quickened intelligence, so that his master “pronounced that, though many of his schoolfellows understood the Latin better, *Gualterus Scott* was behind few in following and enjoying the author’s meaning.”

Throughout his school days and afterwards when he was apprenticed to his father, attended university classes, read for the bar, took part in academical and professional debating societies, Scott steadily and ardently pursued his own favourite studies. His reading in romance and history was really study, and not merely the indulgence of an ordinary schoolboy’s promiscuous appetite for exciting literature. In fact, even as a schoolboy he specialized. He followed the line of overpowering inclination; and even then, as he frankly tells us, “fame was the spur.” He acquired a reputation among his schoolfellows for out-of-the-way knowledge, and also for story-telling, and he worked hard to maintain this character, which compensated to his ambitious spirit his indifferent distinction in ordinary school-work. The youthful “virtuoso,” though he read ten times the usual allowance of novels from the circulating library, was carried by his enthusiasm into fields much less generally attractive. He was still a schoolboy when he mastered French sufficiently well to read through collections of old French romances, and not more than fifteen when; attracted by translations to Italian romantic literature, he learnt the language in order to read Dante and Ariosto in the original. This willingness to face dry work in the pursuit of romantic reading affords a measure of the strength of Scott’s passion. In one of the literary parties brought together to lionize Burns, when the peasant poet visited Edinburgh, the boy of fifteen was the only member of the company who could tell the source of some lines affixed to a picture that had attracted the poet’s attention,—a slight but significant evidence both of the width of his reading and of the tenacity of his memory. The same thoroughness appears in another little circumstance. He took an interest in Scottish family history and genealogy, but, not content with the ordinary sources, he ransacked the MSS. preserved in the Advocates’ Library. By the time he was one and twenty he had acquired such a reputation for his skill in deciphering old manuscripts that his assistance was sought by professional antiquaries.

This early, assiduous, unintermittent study was the main secret, over and above his natural gifts, of Scott’s extempore speed and fertility when at last he found forms into which to pour his vast accumulation of historical and romantic lore. He was, as he said himself, “like an ignorant gamester who keeps up a good hand till he knows how to play it.” That he had vague thoughts from a much earlier period than is commonly supposed of playing the hand some day is extremely probable, if, as he tells us, the idea of writing romances first occurred to him when he read Cervantes in the original. This was long before he was out of his teens; and, if we add that his leading idea in his first novel was to depict a Jacobitic Don Quixote, we can see that there was probably a long interval between the first conception of *Waverley* and the ultimate completion.

Scott’s preparation for painting the life of past times was probably much less unconsciously such than his equally thorough preparation for acting as the painter of Scottish manners and character in all grades of society. With all

¹ Latest edition in 10 vols. fcap. 8vo, Edinburgh, 1847-48.

² Dr Charles Creighton supplies us with the following medical note on Scott’s early illness:—“Scott’s lameness was owing to an arrest of growth in the right leg in infancy. When he was eighteen months old he had a feverish attack lasting three days, at the end of which time it was found that he ‘had lost the power of his right leg,’—i.e., the child instinctively declined to move the ailing member. The malady was a swelling at the ankle, and either consisted in or gave rise to arrest of the bone-forming function along the growing line of cartilage which connects the lower epiphysis of each of the two leg-bones with its shaft. In his fourth year, when he had otherwise recovered, the leg remained ‘much shrunk and contracted.’ The limb would have been blighted very much more if the arrest of growth had taken place at the upper epiphysis of the tibia or the lower epiphysis of the femur. The narrowness and peculiar depth of Scott’s head point to some more general congenital error of bone-making allied to rickets but certainly not the same as that malady. The vault of the skull is the typical ‘scaphoid’ or boat-shaped formation, due to premature union of the two parietal bones along the sagittal suture. When the bones of the cranium are universally affected with that arrest of growth along their formative edges, the sutures become prematurely fixed and effaced, so that the brain-case cannot expand in any direction to accommodate the growing brain. This universal synostosis of the cranial bones is what occurs in the case of microcephalous idiots. It happened to me to show to an eminent French anthropologist a specimen of a miniature or microcephalic skull preserved in the Cambridge museum of anatomy; the French *savant*, holding up the skull and pointing to the ‘scaphoid’ vault of the crown and the effaced sagittal suture, exclaimed ‘Voilà Walter Scott!’ Scott had fortunately escaped the early closure or arrest of growth at other cranial sutures than the sagittal, so that the growing brain could make room for itself by forcing up the vault of the skull bodily. When his head was opened after death, it was observed that ‘the brain was not large, and the cranium thinner than it is usually found to be.’ In favour of the theory of congenital liability it has to be said that he was the ninth of a family of whom the first six died in ‘very early youth.’”

the extent of his reading as a schoolboy and a young man he was far from being a cloistered student, absorbed in his books. In spite of his lameness and his serious illnesses in youth, his constitution was naturally robust, his disposition genial, his spirits high: he was always well to the front in the fights and frolics of the High School, and a boon companion in the "high jinks" of the junior bar. The future novelist's experience of life was singularly rich and varied. While he lived the life of imagination and scholarship in sympathy with a few choice friends, he was brought into intimate daily contact with many varieties of real life. At home he had to behave as became a member of a Puritanic, somewhat ascetic, well-ordered Scottish household, subduing his own inclinations towards a more graceful and comfortable scheme of living into outward conformity with his father's strict rule. Through his mother's family he obtained access to the literary society of Edinburgh, at that time electrified by the advent of Burns, full of vigour and ambition, rejoicing in the possession of not a few widely known men of letters, philosophers, historians, novelists, and critics, from racy and eccentric Monboddo to refined and scholarly Mackenzie. In that society also he may have found the materials for the manners and characters of *St Ronan's Well*. From any tendency to the pedantry of over-culture he was effectually saved by the rougher and manlier spirit of his professional comrades, who, though they respected *belles lettres*, would not tolerate anything in the shape of affectation or sentimentalism. The atmosphere of the Parliament House (the Westminster Hall of Edinburgh) had considerable influence on the tone of Scott's novels. His peculiar humour as a story-teller and painter of character was first developed among the young men of his own standing at the bar. They were the first mature audience on which he experimented, and seem often to have been in his mind's eye when he enlarged his public. From their mirthful companionship by the stove, where the briefless congregated to discuss knotty points in law and help one another to enjoy the humours of judges and litigants, "Duns Scotus" often stole away to pore over old books and manuscripts in the library beneath; but as long as he was with them he was first among his peers in the art of providing entertainment. It was to this market that Scott brought the harvest of the vacation rambles which it was his custom to make every autumn for seven years after his call to the bar and before his marriage. He scoured the country in search of ballads and other relics of antiquity; but he found also and treasured many traits of living manners, many a lively sketch and story with which to amuse the brothers of "the mountain" on his return. His staid father did not much like these escapades, and told him bitterly that he seemed fit for nothing but to be a "gangrel scrape-gut." But, as the companion of "his Liddesdale raids" happily put it, "he was makin' himsell a' the time, but he didna ken maybe what he was about till years had passed: at first he thought o' little, I daresay, but the queerness and the fun."

We may as well dispose at once of Scott's professional career. His father intended him originally to follow his own business, and he was apprenticed in his sixteenth year; but he preferred the upper walk of the legal profession, and was admitted a member of the faculty of advocates in 1792. He seems to have read hard at law for four years at least, but almost from the first to have limited his ambition to obtaining some comfortable appointment such as would leave him a good deal of leisure for literary pursuits. In this he was not disappointed. In 1799 he obtained the office of sheriff-depute of Selkirkshire, with a salary of £300 and very light duties. In 1806 he obtained the reversion of the office of clerk of

session. It is sometimes supposed, from the immense amount of other work that Scott accomplished, that this office was a sinecure. But the duties, which are fully described by Lockhart, were really serious, and kept him hard at fatiguing work, his biographer estimates, for at least three or four hours daily during six months out of the twelve, while the court was in session. He discharged these duties faithfully for twenty-five years, during the height of his activity as an author. He did not enter on the emoluments of the office till 1812, but from that time he received from the clerkship and the sheriffdom combined an income of £1600 a year, being thus enabled to act in his literary undertakings on his often-quoted maxim that "literature should be a staff and not a crutch."

Scott's profession, in addition to supplying him with a competent livelihood, supplied him also with abundance of opportunities for the study of men and manners. Characters of all types and shades find their way into courts of law. The wonder is that so much technical drudgery did not crush every particle of romance out of him; but such was the elasticity and strength of his powers that this daily attendance at the transaction of affairs in open court face to face with living men—under a strain of attention that would have exhausted an ordinary man's allowance of energy—seems rather to have helped him in giving an atmosphere of reality to his representations of the life of the past.

It was not, however, as a prose writer that he was first to make a reputation. The common notion is that Scott, having made a reputation as a poet, was led to attempt romances in prose by a chance impulse, hitting upon the new vein as if by accident. The truth seems rather to be that, as it is his prose romances which give the fullest measure of his genius, so the greater part of his early life was a conscious or unconscious preparation for writing them; whereas his metrical romances, in every way slighter and less rich and substantial, were, comparatively speaking, a casual and temporary deviation from the main purpose of his life. According to his own account, he was led to adopt the medium of verse by a series of accidents. The story is told by himself at length and with his customary frankness and modesty in the *Essay on Imitations of the Ancient Ballad*, prefixed to the 1830 edition of his *Border Minstrelsy*, and in the 1830 introduction to the *Lay of the Last Minstrel*. The first link in the chain was a lecture by Henry Mackenzie on German literature, delivered in 1788. This apprized Scott, who was then a legal apprentice and an enthusiastic student of French and Italian romance, that there was a fresh development of romantic literature in German. As soon as he had the burden of preparation for the bar off his mind he learnt German, and was profoundly excited to find a new school founded on the serious study of a kind of literature his own devotion to which was regarded by most of his companions with wonder and ridicule. We must remember always that Scott quite as much as Wordsworth created the taste by which he was enjoyed, and that in his early days he was half-ashamed of his romantic studies, and pursued them more or less in secret with a few intimates. While he was in the height of his enthusiasm for the new German romance, Mrs Barbauld visited Edinburgh, and recited an English translation of Bürger's *Lenore*. Scott heard of it from a friend, who was able to repeat two lines—

"Tramp, tramp, across the land they speed;
Splash, splash, across the sea!"

The two lines were enough to give Scott a new ambition. He could write such poetry himself! The impulse was strengthened by his reading Lewis's *Monk* and the ballads in the German manner interspersed through the work. He hastened to procure a copy of Bürger, at once executed

translations of several of his ballads, published two of them in a thin quarto in 1796 (his ambition being perhaps quickened by the unfortunate issue of a love affair), and was much encouraged by the applause of his friends. Soon after he met Lewis personally, and his ambition was confirmed. "Finding Lewis," he says, "in possession of so much reputation, and conceiving that if I fell behind him in poetical powers, I considerably exceeded him in general information, I suddenly took it into my head to attempt the style of poetry by which he had raised himself to fame." Accordingly, he composed *Glenfinlas*, *The Eve of St John*, and the *Gray Brother*, which were published in Lewis's collection of *Tales of Wonder*. But he soon became convinced that "the practice of ballad-writing was out of fashion, and that any attempt to revive it or to found a poetical character on it would certainly fail of success." His study of Goethe's *Götz von Berlichingen*, of which he published a translation in 1799, gave him wider ideas. Why should he not do for ancient Border manners what Goethe had done for the ancient feudalism of the Rhine? He had been busy since his boyhood collecting Scottish Border ballads and studying the minutest details of Border history. He began to cast about for a form which should have the advantage of novelty, and a subject which should secure unity of composition. He was engaged at the time preparing a collection of the *Minstrelsy of the Scottish Border*. The first instalment was published in 1802; it was followed by another next year, and by an edition and continuation of the old romance of *Sir Tristram*; and Scott was still hesitating about subject and form for a large original work. It seems probable from a conversation recorded by Gillies that he might have ended by casting his meditated picture of Border manners in the form of a prose romance. But chance at last threw in his way both a suitable subject and a suitable metrical vehicle. He had engaged all his friends in the hunt for Border ballads and legends. Among others, the countess of Dalkeith, wife of the heir-apparent to the dukedom of Buccleuch, interested herself in the work. Happening to hear the legend of a tricksy hobgoblin named Gilpin Horner, she asked Scott to write a ballad about it. He agreed with delight, and, out of compliment to the lady who had given this command to the bard, resolved to connect it with the house of Buccleuch. The subject grew in his fertile imagination, till incidents enough had gathered round the goblin to furnish a framework for his long-designed picture of Border manners. Chance also furnished him with a hint for a novel scheme of verse. Coleridge's fragment of *Christabel*, though begun in 1797—when he and Wordsworth were discussing on the Quantock Hills the principles of such ballads as Scott at the same time was reciting to himself in his gallops on Musselburgh sands—was not published till 1816. But a friend of Scott's, Sir John Stoddart, had met Coleridge in Malta, and had carried home in his memory enough of the unfinished poem to convey to Scott that its metre was the very metre of which he had been in search. Scott introduced still greater variety into the four-beat couplet; but it was to *Christabel* that he owed the suggestion, as one line borrowed whole and many imitated rhythms testify.

The *Lay of the Last Minstrel* appeared in January 1805, and at once became widely popular. It sold more rapidly than poem had ever sold before. Scott was astonished at his own success, although he expected that "the attempt to return to a more simple and natural style of poetry was likely to be welcomed." Many things contributed to the extraordinary demand for the *Lay*. First and foremost, no doubt, we must reckon its simplicity. After the abstract themes and abstruse, elaborately allusive style of the 18th century, the public were glad of verse that

could be read with ease and even with exhilaration, verse in which a simple interesting story was told with brilliant energy, and simple feelings were treated not as isolated themes but as incidents in the lives of individual men and women. The thought was not so profound, the lines were not so polished, as in *The Pleasures of Memory* or *The Pleasures of Hope*, but the "light-horseman sort of stanza" carried the reader briskly over a much more diversified country, through boldly outlined and strongly coloured scenes. No stanza required a second reading; you had not to keep attention on the stretch or pause and construe laboriously before you could grasp the writer's meaning or enter into his artfully condensed sentiment. To remember the pedigrees of all the Scotts, or the names of all the famous chiefs and hardy retainers "whose gathering word was Bellenden," might have required some effort, but only the conscientious reader need care to make it. The only puzzle in the *Lay* was the goblin page, and the general reader was absolved from all trouble about him by the unanimous declaration of the critics, led by Jeffrey in the *Edinburgh Review*, that he was a grotesque excrescence, in no way essential to the story. It is commonly taken for granted that Scott acquiesced in this judgment, his politely ironic letter to Miss Seward being quoted as conclusive. This is hardly fair to the poor goblin, seeing that his story was the germ of the poem and determines its whole structure; but it is a tribute to the lively simplicity of the *Lay* that few people should be willing to take the very moderate amount of pains necessary to see the goblin's true position in the action. The supernatural element was Scott's most risky innovation. For the rest, he was a cautious and conservative reformer, careful not to offend established traditions. He was far from raising the standard of rebellion, as Wordsworth had done, against the great artistic canon of the classical school

"True art is nature to advantage dressed."

To "engraft modern refinement on ancient simplicity," to preserve the energy of the old ballad without its rudeness and bareness of poetic ornament, was Scott's avowed aim. He adhered to the poetic diction against which Wordsworth protested. His rough Borderers are "dressed to advantage" in the costume of romantic chivalry. The baronial magnificence of Branksome, Deloraine's "shield and jack and acton," the elaborate ceremony of the combat between the pseudo-Deloraine and Musgrave, are concessions to the taste of the 18th century. Further, he disarmed criticism by putting his poem into the mouth of an ancient minstrel, thus pictorially emphasizing the fact that it was an imitation of antiquity, and providing a scapegoat on whose back might be laid any remaining sins of rudeness or excessive simplicity. And, while imitating the antique romance, he was careful not to imitate its faults of rambling, discursive, disconnected structure. He was scrupulously attentive to the classical unities of time, place, and action. The scene never changes from Branksome and its neighbourhood; the time occupied by the action (as he pointed out in his preface) is three nights and three days; and, in spite of all that critics have said about the superfluity of the goblin page, it is not difficult to trace unity of intention and regular progressive development in the incidents.

The success of the *Lay* decided finally, if it was not decided already, that literature was to be the main business of Scott's life, and he proceeded to arrange his affairs accordingly. It would have been well for his comfort, if not for his fame, had he adhered to his first plan, which was to buy a small mountain-farm near Bowhill, with the proceeds of some property left to him by an uncle, and

divide his year between this and Edinburgh, where he had good hopes, soon afterwards realized, of a salaried appointment in the Court of Session. This would have given him ample leisure and seclusion for literature, while his private means and official emoluments secured him against dependence on his pen. He would have been laird as well as sheriff of the cairn and the scaur, and as a man of letters his own master. Since his marriage in 1797 with Miss Charpentier, daughter of a French refugee, his chief residence had been at Lasswade, about six miles from Edinburgh. But on a hint from the lord-lieutenant that the sheriff must live at least four months in the year within his county, and that he was attending more closely to his duties as quartermaster of a mounted company of volunteers than was consistent with the proper discharge of his duties as sheriff, he had moved his household in 1804 to Ashiestiel. When his uncle's bequest fell in, he determined to buy a small property on the banks of the Tweed within the limits of his sheriffdom. There, within sight of Newark Castle and Bowhill, he proposed to live like his ancient minstrel, as became the bard of the clan, under the shadow of the great ducal head of the Scotts. But this plan was deranged by an accident. It so happened that an old schoolfellow, James Ballantyne, a printer in Kelso, whom he had already befriended, transplanted to Edinburgh, and furnished with both work and money, applied to him for a further loan. Scott declined to lend, but offered to join him as sleeping partner. Thus the intended purchase money of Broadmeadows became the capital of a printing concern, of which by degrees the man of letters became the overwrought slave, milch-cow, and victim.

When the *Lay* was off his hands, Scott's next literary enterprise was a prose romance—a confirmation of the argument that he did not take to prose after Byron had “bet him,” as he put it, in verse, but that romance writing was a long-cherished purpose. He began *Waverley*, but a friend to whom he showed the first chapters—which do not take *Waverley* out of England, and describe an education in romantic literature very much like Scott's own—not unnaturally decided that the work was deficient in interest and unworthy of the author of the *Lay*. Scott accordingly laid *Waverley* aside. We may fairly conjecture that he would not have been so easily diverted had he not been occupied at the time with other heavy publishing enterprises calculated to bring grist to the printing establishment. His active brain was full of projects for big editions, which he undertook to carry through on condition that the printing was done by Ballantyne & Co., the “Co.” being kept a profound secret, because it might have injured the lawyer and poet professionally and socially to be known as partner in a commercial concern. Between 1806 and 1812, mainly to serve the interests of the firm, though of course the work was not in itself unattractive to him, Scott produced his elaborate editions of Dryden, Swift, the Somers Tracts, and the Sadler State papers. Incidentally these laborious tasks contributed to his preparation for the main work of his life by extending his knowledge of English and Scottish history.

Marmion, begun in November 1806 and published in February 1808, was written as a relief to “graver cares,” though in this also he aimed at combining with a romantic story a solid picture of an historical period. It was even more popular than the *Lay*. Scott's resuscitation of the four-beat measure of the old “gestours” afforded a signal proof of the justness of their instinct in choosing this vehicle for their recitations. The four-beat lines of *Marmion* took possession of the public like a kind of madness: they not only clung to the memory but they would not keep off the tongue: people could not help spouting them

in solitary places and muttering them as they walked about the streets. The critics, except Jeffrey, who may have been offended by the pronounced politics of the poet, were on the whole better pleased than with the *Lay*. Their chief complaint was with the “introductions” to the various cantos, which were objected to as vexatiously breaking the current of the story.¹

The triumphant success of *Marmion*, establishing him as *facile princeps* among living poets, gave Scott such a *heeze*, to use his own words, “as almost lifted him off his feet.” He touched then the highest point of prosperity and happiness. Presently after, he was irritated and tempted by a combination of little circumstances into the great blunder of his life, the establishment of the publishing house of John Ballantyne & Co. A coolness arose between him and Jeffrey, chiefly on political but partly also on personal grounds. They were old friends, and Scott had written many articles for the *Review*, but its political attitude at this time was intensely unsatisfactory to Scott. To complete the breach, Jeffrey reviewed *Marmion* in a hostile spirit. A quarrel occurred also between Scott's printing firm and Constable, the publisher, who had been the principal feeder of its press. Then the tempter appeared in the shape of Murray, the London publisher, anxious to secure the services of the most popular *littérateur* of the day. The result of negotiations was that Scott set up, in opposition to Constable, “the crafty,” “the grand Napoleon of the realms of print,” the publishing house of John Ballantyne & Co., to be managed by a dissipated and swaggering little tailor, whom he nicknamed “Rigdumfunnidos” for his talents as a mimic and low comedian. Scott interested himself warmly in starting the *Quarterly Review*, and in return Murray constituted Ballantyne & Co. his Edinburgh agents. Scott's trust in Rigdumfunnidos and his brother, “Aldiborontiphosphornio,” and in his own power to supply all their deficiencies, is as strange a piece of infatuation as any that ever formed a theme for romance or tragedy. Their devoted attachment to the architect of their fortunes and proud confidence in his powers helped forward to the catastrophe, for whatever Scott recommended they agreed to, and he was too immersed in multifarious literary work and professional and social engagements to have time for cool examination of the numerous rash speculative ventures into which he launched the firm.

The *Lady of the Lake* (May 1810) was the first great publication by the new house. It was received with enthusiasm, even Jeffrey joining in the chorus of applause. It made the Perthshire Highlands fashionable for tourists, and raised the post-horse duty in Scotland. But it did not make up to Ballantyne & Co. for their heavy investments in unsound ventures. The *Edinburgh Annual Register*, meant as a rival to the *Edinburgh Review*, though Scott engaged Southey to write for it and wrote for it largely himself, proved a failure. In a very short time the warehouses of the firm were filled with unsaleable stock. By the end of three years Scott began to write to his partners about the propriety of “reefing sails.” But apparently he was too much occupied to look into the accounts of the firm, and, so far from understanding the real state of their affairs, he considered himself rich enough to make his first purchase of land at Abbotsford. But he had hardly settled there in the spring of 1812, and begun his schemes for building and planting and converting a bare moor into a richly wooded *pleasure-ance*, than his business troubles began, and he found himself harassed by fears of bankruptcy. Rigdumfunnidos concealed the situation as

¹ See Mr Hutton's *Scott*, in English Men of Letters Series, p. 56, for a good defence of these introductions. Scott advertised them originally as a separate publication.

long as he could, but as bill after bill came due he was obliged to make urgent application to Scott, and the truth was thus forced from him item by item. He had by no means revealed all when Scott, who behaved with admirable good-nature, was provoked into remonstrating, "For heaven's sake, treat me as a man and not as a milch-cow." The proceeds of *Rokeby* (January 1813) and of other labours of Scott's pen were swallowed up, and bankruptcy was inevitable, when Constable, still eager at any price to secure Scott's services, came to the rescue. With his help three crises were tided over in 1813.

It was in the midst of these ignoble embarrassments that Scott opened up the rich new vein of the Waverley novels. He chanced upon the manuscript of the opening chapters of *Waverley*, and resolved to complete the story. Four weeks in the summer of 1814 sufficed for the work, and *Waverley* appeared without the author's name in July. Many plausible reasons might be given and have been given for Scott's resolution to publish anonymously. The quaintest reason, and possibly the main one, though it is hardly intelligible now, is that given by Lockhart, that he considered the writing of novels beneath the dignity of a grave clerk of the Court of Session. Why he kept up the mystification, though the secret was an open one to all his Edinburgh acquaintances, is more easily understood. He enjoyed it, and his formally initiated coadjutors enjoyed it; it relieved him from the annoyances of foolish compliment; and it was not unprofitable,—curiosity about "the Great Unknown" keeping alive the interest in his works. The secret was so well kept by all to whom it was definitely entrusted, and so many devices were used to throw conjecture off the scent, that even Scott's friends, who were certain of the authorship from internal evidence, were occasionally puzzled. He kept on producing in his own name as much work as seemed humanly possible for an official who was to be seen every day at his post and as often in society as the most fashionable of his professional brethren. His treatises on chivalry, romance, and the drama, besides an elaborate work in two volumes on Border antiquities, appeared in the same year with *Waverley*, and his edition of Swift in nineteen volumes in the same week. The *Lord of the Isles* was published in January 1815; *Guy Mannering*, written in "six weeks about Christmas," in February; *Paul's Letters to his Kinsfolk* and *The Field of Waterloo* in the same year. *Harold the Dauntless*,¹ not to mention the historical part of the *Annals of the Registers*, appeared in the same year with *The Antiquary*, *The Black Dwarf*, and *Old Mortality* (1816). No wonder that the most positive interpreters of internal evidence were mystified. It was not as if he had buried himself in the country for the summer half of the year. On the contrary, he kept open house at Abbotsford in the fine old feudal fashion and was seldom without visitors. His own friends and many strangers from a distance, with or without introductions, sought him there, and found a hearty hospitable country laird, entirely occupied to all outward appearance with local and domestic business and sport, building and planting, adding wing to wing, acre to acre, plantation to plantation, with just leisure enough for the free-hearted entertainment of his guests and the cultivation of friendly relations with his humble neighbours. How could such a man find time to write two or three novels a year, besides what was published in his own name? Even the few intimates who knew how early he got up to prepare his packet for the printer, and had some idea of the extraordinary power that he had acquired of commanding his faculties for the utilization of odd moments, must have

wondered at times whether he had not inherited the arts of his ancestral relation Michael Scot, and kept a goblin in some retired attic or vault.

Scott's fertility is not absolutely unparalleled; the late Mr Trollope claimed to have surpassed him in rate as well as total amount of production, having also business duties to attend to. But in speed of production combined with variety and depth of interest and weight and accuracy of historical substance Scott is still unrivalled. On his claims as a serious historian, which Carlyle ignored in his curiously narrow and splenetic criticism, he was always, with all his magnanimity, peculiarly sensitive. A certain feeling that his antiquarian studies were undervalued seems to have haunted him from his youth. It was probably this that gave the sting to Jeffrey's criticism of *Marmion*, and that tempted him to the somewhat questionable proceeding of reviewing his own novels in the *Quarterly* upon the appearance of *Old Mortality*. He was nettled besides at the accusation of having treated the Covenanters unfairly, and wanted to justify himself by the production of historical documents. In this criticism of himself Scott replied lightly to some of the familiar objections to his work, such as the feebleness of his heroes, *Waverley*, *Bertram*, *Lovel*, and the melodramatic character of some of his scenes and characters. But he argued more seriously against the idea that historical romances are the enemies of history, and he rebutted by anticipation Carlyle's objection that he wrote only to amuse idle persons who like to lie on their backs and read novels. His *apologia* is worth quoting. Historical romances, he admits, have always been failures, but the failure has been due to the imperfect knowledge of the writers and not to the species of composition. If, he says, anachronisms in manners can be avoided, and "the features of an age gone by can be recalled in a spirit of delineation at once faithful and striking, . . . the composition itself is in every point of view dignified and improved; and the author, leaving the light and frivolous associates with whom a careless observer would be disposed to ally him, takes his seat on the bench of the historians of his time and country. In this proud assembly, and in no mean place of it, we are disposed to rank the author of these works. At once a master of the great events and minute incidents of history, and of the manners of the times he celebrates, as distinguished from those which now prevail, the intimate thus of the living and of the dead, his judgment enables him to separate those traits which are characteristic from those that are generic; and his imagination, not less accurate and discriminating than vigorous and vivid, presents to the mind of the reader the manners of the times, and introduces to his familiar acquaintance the individuals of the drama as they thought and spoke and acted." This defence of himself shows us the ideal at which Scott aimed, and which he realized. He was not in the least unconscious of his own excellence. He did not hesitate in this review to compare himself with Shakespeare in respect of truth to nature. "The volume which this author has studied is the great book of nature. He has gone abroad into the world in quest of what the world will certainly and abundantly supply, but what a man of great discrimination alone will find, and a man of the very highest genius will alone depict after he has discovered it. The characters of Shakespeare are not more exclusively human, not more perfectly men and women as they live and move, than those of this mysterious author."

The immense strain of Scott's double or quadruple life as sheriff and clerk, hospitable laird, poet, novelist, and miscellaneous man of letters, publisher and printer, though the prosperous excitement sustained him for a time, soon told upon his health. Early in 1817 began a series of

¹ This poem, like the *Bridal of Triermain*, did not bear his name on the title-page, but the authorship was an open secret, although he tried to encourage the idea that the author was his friend Erskine.

attacks of agonizing cramp of the stomach, which recurred at short intervals during more than two years. But his appetite and capacity for work remained unbroken. He made his first attempt at play-writing¹ as he was recovering from the first attack; before the year was out he had completed *Rob Roy*, and within six months it was followed by *The Heart of Midlothian*, which by general consent occupies the highest rank among his novels. The *Bride of Lammermoor*, *The Legend of Montrose*, and *Ivanhoe* were dictated to amanuenses, through fits of suffering so acute that he could not suppress cries of agony. Still he would not give up. When Laidlaw begged him to stop dictating he only answered, "Nay, Willie, only see that the doors are fast! I would fain keep all the cry as well as the wool to ourselves; but as to giving over work, that can only be when I am in woollen."

Throughout those two years of intermittent ill-health, which was at one time so serious that his life was despaired of and he took formal leave of his family, Scott's semi-public life at Abbotsford continued as usual,—swarms of visitors coming and going, and the rate of production on the whole suffering no outward and visible check, all the world wondering at the novelist's prodigious fertility. Mr Ruskin lately put forward the opinion that there is a distinct falling off in the quality of Scott's work traceable from the time of his first serious illness, arguing as a proof of the healthiness of Scott's organization that "he never gains anything by sickness; the whole man breathes or faints as one creature; the ache that stiffens a limb chills his heart, and every pang of the stomach paralyses the brain." Yet, when the world was not aware of the state of the novelist's health, and novel after novel was received without any abatement of enthusiasm, but rather with growing wonder and admiration, no critic was acute enough to detect this, and it is somewhat unfortunate for the theory that Mr Ruskin has mistaken the date of Scott's first illness and included among the masterpieces produced in perfect health *Rob Roy* and *The Heart of Midlothian*, both composed through recurrent fits of intense bodily pain. The first of the series concerning which there were murmurs of dissatisfaction was *The Monastery*, which was the first completed after the re-establishment of the author's bodily vigour. The failure, such as it was, was due rather to the subject than the treatment, and *The Abbot*, in which Mary Queen of Scots is introduced, was generally hailed as fully sustaining the reputation of "the Great Unknown." *Kenilworth*, *The Pirate*, *The Fortunes of Nigel*, *Feveril of the Peak*, *Quentin Durward*, *St Ronan's Well*, *Redgauntlet*, followed in quick succession in the course of three years, and it was not till the last two were reached that the cry that the author was writing too fast began to gather volume. *St Ronan's Well* was very severely criticized and condemned. And yet Mr Leslie Stephen tells a story of a dozen modern connoisseurs in the Waverley novels who agreed that each should write down separately the name of his favourite novel, when it appeared that each had without concert named *St Ronan's Well*. There is this certainly to be said for *St Ronan's*, that, in spite of the heaviness of some of the scenes at the "hottle" and the artificial melodramatic character of some of the personages, none of Scott's stories is of more absorbing or more brilliantly diversified interest. Contradictions between contemporary popular opinion and mature critical judgment, as well as diversities of view among critics themselves, rather shake confidence in individual judgment on the

vexed but not particularly wise question which is the best of Scott's novels. There must, of course, always be inequalities in a series so prolonged. The author cannot always be equally happy in his choice of subject, situation, and character. Naturally also he dealt first with the subjects of which his mind was fullest. But any theory of falling off or exhaustion based upon plausible general considerations has to be qualified so much when brought into contact with the facts that very little confidence can be reposed in its accuracy. *The Fortunes of Nigel* comes comparatively late in the series and has often been blamed for its looseness of construction. Scott himself always spoke slightly of his plots, and humorously said that he proceeded on Mr Bayes's maxim, "What the deuce is a plot good for but to bring in good things?" Yet so competent a critic as Mr Hutton has avowed that on the whole he prefers *The Fortunes of Nigel* to any other of Scott's novels. An attempt might be made to value the novels according to the sources of their materials, according as they are based on personal observation, documentary history, or previous imaginative literature. On this principle *Ivanhoe* and *The Tales of the Crusaders* might be adjudged inferior as being based necessarily on previous romance. But as a matter of fact Scott's romantic characters are vitalized, clothed with a verisimilitude of life, out of the author's deep, wide, and discriminating knowledge of realities, and his observation of actual life was coloured by ideals derived from romance. He wrote all his novels out of a mind richly stored with learning of all kinds, and in the heat of composition seems to have drawn from whatever his tenacious memory supplied to feed the fire of imagination, without pausing to reflect upon the source. He did not exhaust his accumulations from one source first and then turn to another, but from first to last drew from all as the needs of the occasion happened to suggest.

Towards the close of 1825, after eleven years of brilliant and prosperous labour, encouraged by constant tributes of admiration, homage, and affection such as no other literary potentate has ever enjoyed, realizing his dreams of baronial splendour and hospitality on a scale suited to his large literary revenues, Scott suddenly discovered that the foundations of his fortune were unsubstantial. He had imagined himself clear of all embarrassments in 1818, when all the unsaleable stock of John Ballantyne & Co. was bargained off by Rigdum to Constable for Waverley copyrights, and the publishing concern was wound up. Apparently he never informed himself accurately of the new relations of mutual accommodation on which the printing firm then entered with the great but rashly speculative publisher, and drew liberally for his own expenditure against the undeniable profits of his novels without asking any questions, trusting blindly in the solvency of his commercial henchmen. Unfortunately, "lifted off their feet" by the wonderful triumphs of their chief, they thought themselves exempted like himself from the troublesome duty of inspecting ledgers and balancing accounts, till the crash came. From a diary which Scott began a few days before the first rumours of financial difficulty reached him we know how he bore from day to day the rapidly unfolded prospect of unsuspected liabilities. "Thank God," was his first reflexion, "I have enough to pay more than 20s. in the pound, taking matters at the worst." But a few weeks revealed the unpleasant truth that, owing to the way in which Ballantyne & Co. were mixed up with Constable & Co., and Constable with Hurst & Robinson, the failure of the London house threw upon him personal responsibility for £130,000.

How Scott's pride rebelled against the dishonour of bankruptcy, how he toiled for the rest of his life to clear

¹ *The Doom of Devorgoil*. This and his subsequent dramatic sketches, *Macduff's Cross*, *Halidon Hill*, and *The Ayrshire Tragedy*, were slight compositions, dashed off in a few days, and afford no measure of what Scott might have done as a dramatist if he had studied the conditions of stage representation.

off this enormous debt, declining all offers of assistance and asking no consideration from his creditors except time, and how nearly he succeeded, is one of the most familiar chapters in literary history, and would be one of the saddest were it not for the heroism of the enterprise. His wife died soon after the struggle began, and he suffered other painful bereavements; but, though sick at heart, he toiled on indomitably, and, writing for honour, exceeded even his happiest days in industrious speed. If he could have maintained the rate of the first three years, during which he completed *Woodstock*, three *Chronicles of the Canongate*, *The Fair Maid of Perth*, *Anne of Geierstein*, the *Life of Napoleon* (involving much research, and equal in amount to thirteen novel volumes), part of his *History of Scotland*, the Scottish series of *Tales of a Grandfather*, besides several magazine articles, some of them among the most brilliant of his miscellaneous writings, and prefaces and notes to a collected edition of his novels,—if he could have continued at this rate he might soon have freed himself from all his encumbrances. The result of his exertions from January 1826 to January 1828 was nearly £40,000 for his creditors. But the terrific labour proved too much even for his endurance. Ugly symptoms began to alarm his family in 1829, and in February of 1830 he had his first stroke of paralysis. Still he was undaunted, and not all the persuasions of friends and physicians could induce him to take rest. "During 1830," Mr Lockhart says, "he covered almost as many sheets with his MS. as in 1829," the new introductions to a collected edition of his poetry and the *Letters on Demonology and Witchcraft* being amongst the labours of the year. He had a slight touch of apoplexy in November and a distinct stroke of paralysis in the following April; but, in spite of these warnings and of other bodily ailments, he had two more novels, *Count Robert of Paris* and *Castile Dangerous*, ready for the press by the autumn of 1831. He would not yield to the solicitations of his friends and consent to try rest and a change of scene, till fortunately, as his mental powers failed, he became possessed of the idea that all his debts were at last paid and that he was once more a free man. In this belief he happily remained till his death. When it was known that his physicians recommended a sea voyage for his health, a Government vessel was put at his disposal, and he cruised about in the Mediterranean and visited places of interest for the greater part of a year before his death. But, when he felt that the end was near, he insisted on being carried across Europe that he might die on his beloved Tweedside at Abbotsford, where he expired on 21st September 1832. He was buried at Dryburgh Abbey on 26th September following.

A complete list of Scott's works is given in the *Catalogue of Scott Exhibition, 1871*, Edinburgh, 1872. The standard biography of Scott is that by Lockhart referred to above; see also Allan, *Life of Scott*, Edinburgh, 1834. (W. M.)

SCOTT, WILLIAM. See STOWELL, LORD.

SCOTT, WINFIELD (1786-1866), American general, was born near Petersburg, Virginia, 13th June 1786, the grandson of a Scottish refugee from the field of Culloden. He was a student at William and Mary College in 1805, and was admitted to the bar at Richmond, Virginia, in 1807. One of the sudden war excitements of the time changed the course of his life, and he obtained a captain's commission in the United States army in 1808. He served on the Niagara frontier throughout the war of 1812-15, and became one of its leading figures, rising rapidly through all the grades of the service to that of major-general, which was then the highest. Among other curious testimonials to his valour and conduct, he received from Princeton College in 1814 the honorary degree of doctor of laws, a distinction on

which he never ceased to look with peculiar satisfaction. In 1841 he became the senior major-general of the army, and in 1855, after he had passed out of political life, the exceptional grade of lieutenant-general was created for him. His most noteworthy military achievement was his conduct of the main campaign against Mexico in 1847. Landing (9th March) at Vera Cruz with 12,000 men, he fought his way through a hostile country to the capital city of Mexico, which he captured 14th September, thereby practically ending the war. His service, however, was not confined to the army; from 1815 until 1861 he was the most continuously prominent public man of the country, receiving and justifying every mark of public confidence in his integrity, tact, and reasonableness. At a time (1823) when duelling was almost an imperative duty of an officer, he resisted successfully the persistent efforts of a brother officer (Andrew Jackson) to force him into a combat; and the simple rectitude of his intentions was so evident that he lost no ground in public estimation. In 1832, when ordered to Charleston by President Jackson during the "nullification" troubles, he secured every advantage for the Government, while his skilful and judicious conduct gave no occasion to South Carolina for an outbreak. In like manner, in the Black Hawk Indian troubles of 1832-33, in the Canadian "Patriot War" of 1837-38, in the boundary dispute of 1838 between Maine and New Brunswick, in the San Juan difficulty in 1859, wherever there was imminent danger of war and a strong desire to keep the peace, all thoughts turned instinctively to Scott as a fit instrument of an amicable settlement, and his success always justified the choice. Such a career seemed a gateway to political preferment, and his position was strengthened by the notorious fact that, as he was a Whig, the Democratic administration had persistently tried to subordinate his claims to those of officers of its own party. In 1852 his party nominated him for the presidency; but, though his services had been so great and his capacity and integrity were beyond question, he had other qualities which counted heavily against him. He was easily betrayed into the most egregious blunders of speech and action, which drew additional zest from his portly and massive form and a somewhat pompous ceremoniousness of manner. He destroyed his chances of election in the North. The Southern Whigs, believing him to be under the influence of the Seward or anti-slavery wing of the party, cast no strong vote for him, and he was overwhelmingly defeated in both sections, completing the final overthrow of his party. In 1861 he remained at the head of the United States armies, in spite of the secession of his State, until November, when he retired on account of old age and infirmities. After travelling for a time in Europe, he published in 1864 his autobiography, a work which reveals the strong and weak points of his character,—his integrity and complete honesty of purpose, his inclination to personal vanity, his rigid precision in every point of military precedent and etiquette, and his laborious affectation of an intimate acquaintance with *belles lettres*. He died at West Point, New York, 29th May 1866.

The *Autobiography of Lieutenant-General Winfield Scott, LL.D.*, in two volumes, gives the facts of his career at length. For his defeat in 1852, see Von Holst's *Constitutional History*, vol. iv. p. 171 of the original, p. 206 of the English translation.

SCOTUS. See DUNS SCOTUS and SCHOLASTICISM.

SCRANTON, a city of the United States, capital of Lackawanna county, Pennsylvania, on a plateau at the junction of the Roaring Brook and the Lackawanna river, 162 miles north of Philadelphia. It is the centre of the great coal-mining district in the country and the seat of a large number of iron and steel works, rolling-mills, blast-furnaces, &c., and extensive factories for the production of

rails, locomotives, mining machinery, steam-boilers, stoves, carriages, edge-tools, &c. A public library, a theatre, an academy of music, a hospital, a public hall, a driving park, a Roman Catholic cathedral, a home for the friendless, and a museum of Indian stone relics are among the more prominent features of the place. The population was 9223 in 1860, 35,092 in 1870, and 45,850 in 1880.

Slocum Farm, as the site was called subsequent to 1798, saw its first blast-furnace erected in 1840 by George and Selden Scranton, who soon added a rolling-mill and the manufacture of rails. The opening of the railway in 1856 gave a great stimulus to the new town (1854), which obtained a city charter in 1866. It is divided into twenty-one wards, of which the 4th, 5th, 6th, 14th, 15th, and 18th are known as Hyde Park, the 1st, 2d, and 3d as Providence.

SCREAMER, a bird inhabiting Guiana and the Amazon valley, so called in 1781 by Pennant (*Gen. Birds*, p. 37) "from the violent noise it makes,"—the *Palamedea cornuta* of Linnæus. First made known in 1648 by Marcgrave under the name of "Anhima," it was more fully described and better figured by Buffon under that of *Kamichi*, still applied to it by French writers. Of about the size of a Turkey, it is remarkable for the curious "horn" or slender caruncle, more than three inches long, it bears on its crown, the two sharp spurs with which each wing is armed, and its elongated toes. Its plumage is plain in colour, being of an almost uniform greyish black above, the space round the eyes and a ring round the neck being variegated with white, and a patch of pale rufous appearing above the carpal joint, while the lower parts of the body are white. Closely related to this bird is another first described by Linnæus as a species of *Parra* (*JACANA*, vol. xiii. p. 531), to which group it certainly does not belong, but separated therefrom by Illiger to form the genus *Chauna*, and now known as *C. chavaria*, very generally in English as the "Crested Screamer,"¹ a name which was first bestowed on the *SERIEMA* (*q.v.*). This bird inhabits the lagoons and swamps of Paraguay and Southern Brazil, where it is called "Chajá" or "Chaka," and is smaller than the preceding, wanting its "horn," but having its head furnished with a dependent crest of feathers. Its face and throat are white, to which succeeds a blackish ring, and the rest of the lower parts are white, more or less clouded with cinereous. According to Mr Gibson (*Ibis*, 1880, pp. 165, 166), its nest is a light construction of dry rushes, having its foundation in the water, and contains as many as six eggs, which are white tinged with buff. The young are covered with down of a yellowish brown colour. A most singular habit possessed by this bird is that of rising in the air and soaring there in circles at an immense altitude, uttering at intervals the very loud cry of which its local name is an imitation. From a dozen to a score may be seen at once so occupying themselves. The young are often taken from the nest and reared by the people to attend upon and defend their poultry, a duty which is faithfully² and, owing to the spurs with which the Chaka's wings are armed, successfully discharged. Another very curious property of this bird, which was observed by Jacquin, who brought it to the notice of Linnæus,³ is its emphysematous condition,—there being a layer of air-cells between the skin and the muscles, so that on any part of the body being pressed a crackling sound is heard. In Central America occurs another species, *C. derbiana*, chiefly distinguished by the darker colour of its plumage. For this a distinct genus, *Ischyornis*, was proposed, but apparently without necessity, by Reichenbach (*Syst. Avium*, p. xxi.).

The taxonomic position of the *Palamedeidae*, for all will

¹ Under this name its curious habits have been well described by Mr W. H. Hudson (*Gentleman's Magazine*, Sept. 1885, pp. 280-287).

² Hence Latham's name for this species is "Faithful Jacana,"—he supposing it to belong to the genus in which Linnæus placed it.

³ "Tacta manu cutis, sub pennis etiam lanosa, crepat ubique fortiter" (*Syst. Nat.*, ed. 12, i. p. 260).

allow to the Screamers the rank of a Family at least, has been much debated, and cannot be regarded as fixed. Their Anserine relations were pointed out by Prof. Parker in the *Zoological Proceedings* for 1863 (pp. 511-518), and in the same work for 1867 Prof. Huxley placed the Family among his *Chenomorphæ*; but this view was contravened in 1876 by Garrod, who said, "The Screamers must have sprung from the primary avian stock as an independent offshoot at much the same time as did most of the other important families." Accordingly in 1880 Mr Sclater regarded them as forming a distinct "Order," *Palamedææ*, which he, however, placed next to the true *Anseres*, from the neighbourhood of which, as has been already stated (*ORNITHOLOGY*, vol. xviii. p. 47), the present writer thinks the *Palamedeidae* can hardly be removed. (A. N.)

SCREW. The screw is the simplest instrument for converting a uniform motion of rotation into a uniform motion of translation (see *MECHANICS*, vol. xv. p. 754). Metal screws requiring no special accuracy are generally cut by taps and dies. A tap is a cylindrical piece of steel having a screw on its exterior with sharp cutting edges; by forcing this with a revolving motion into a hole of the proper size, a screw is cut on its interior forming what is known as a nut or female screw. The die is a nut with sharp cutting edges used to screw upon the outside of round pieces of metal and thus produce male screws. More accurate screws are cut in a lathe by causing the carriage carrying the tool to move uniformly forward, thus a continuous spiral line is cut on the uniformly revolving cylinder fixed between the lathe centres. The cutting tool may be an ordinary form of lathe tool or a revolving saw-like disk. (See *MACHINE TOOLS*, vol. xv. p. 153.)

Errors of Screws.—For scientific purposes the screw must be so regular that it moves forward in its nut exactly the same distance for each given angular rotation around its axis. As the mountings of a screw introduce many errors, the final and exact test of its accuracy can only be made when it is finished and set up for use. A large screw can, however, be roughly examined in the following manner. (1) See whether the surface of the threads has a perfect polish. The more it departs from this, and approaches the rough torn surface as cut by the lathe tool, the worse it is. A perfect screw has a perfect polish. (2) Mount upon it between the centres of a lathe and the slip a short nut which fits perfectly. If the nut moves from end to end with equal friction, the screw is uniform in diameter. If the nut is long, unequal resistance may be due to either an error of run or a bend in the screw. (3) Fix a microscope on the lathe carriage and focus its single cross-hair on the edge of the screw and parallel to its axis. If the screw runs true at every point, its axis is straight. (4) Observe whether the short nut runs from end to end of the screw without a wobbling motion when the screw is turned and the nut kept from revolving. If it wobbles the screw is said to be drunk. One can see this error better by fixing a long pointer to the nut, or by attaching to it a mirror and observing an image in it with a telescope. The following experiment will also detect this error. (5) Put upon the screw two well-fitting and rather short nuts, which are kept from revolving by arms bearing against a straight edge parallel to the axis of the screw. Let one nut carry an arm which supports a microscope focused on a line ruled on the other nut. Screw this combination to different parts of the screw. If during one revolution the microscope remains in focus, the screw is not drunk; and, if the cross-hairs bisect the line in every position, there is no error of run.

Making Accurate Screws.—To produce a screw of a foot or even a yard long with errors not exceeding $\frac{1}{1000}$ th of an inch is not difficult. Professor William A. Rogers of Harvard observatory has invented a process in which the tool of the lathe while cutting the screw is moved so as to counteract the errors of the lathe screw. The screw is then partly ground to get rid of local errors. But, where the highest accuracy is needed, we must resort in the case of screws, as in all other cases, to grinding. A long solid nut, tightly fitting the screw in one position, cannot be moved freely to another position unless the screw is very accurate. If grinding material is applied and the nut is constantly tightened, it will grind out all errors of run, drunkenness, crookedness, and irregularity of size. The condition is that the nut must be long, rigid, and capable of being tightened as the grinding proceeds; also the screw must be ground longer than it will finally be needed so that the imperfect ends may be removed.

The following process will produce a screw suitable for ruling

gratings for optical purposes. Suppose it is our purpose to produce a screw which is finally to be 9 inches long, not including bearings, and $1\frac{1}{2}$ inches in diameter. Select a bar of soft Bessemer steel, which has not the hard spots usually found in cast steel, about $1\frac{1}{2}$ inches in diameter and 30 long. Put it between lathe centres and turn it down to 1 inch diameter everywhere, except about 12 inches in the centre, where it is left a little over $1\frac{1}{2}$ inches in diameter for cutting the screw. Now cut the screw with a triangular thread a little sharper than 60° . Above all, avoid a fine screw, using about 20 threads to the inch.

The grinding nut, about 11 inches long, has now to be made. Fig. 1 represents a section of the nut, which is made of brass, or better

FIG. 1.—Section of grinding nut.

of Bessemer steel. It consists of four segments,—*a, a*, which can be drawn about the screw by two collars, *b, b*, and the screw *c*. Wedges between the segments prevent too great pressure on the screw. The final clamping is effected by the rings and screws, *d, d*, which enclose the flanges, *e*, of the segments. The screw is now placed in a lathe and surrounded by water whose temperature can be kept constant to 1°C , and the nut placed on it. In order that the weight of the nut may not make the ends too small, it must either be counterbalanced by weights hung from a rope passing over pulleys in the ceiling, or the screw must be vertical during the whole process. Emery and oil seem to be the only available grinding materials, though a softer silica powder might be used towards the end of the operation to clean off the emery and prevent future wear. Now grind the screw in the nut, making the nut pass backwards and forwards over the screw, its whole range being nearly 20 inches at first. Turn the nut end for end every ten minutes and continue for two weeks, finally making the range of the nut only about 10 inches, using finer washed emery and moving the lathe slower to avoid heating. Finish with a fine silica powder or rouge. During the process, if the thread becomes too blunt, recut the nut by a short tap so as not to change the pitch at any point. This must of course not be done less than five days before the finish. Now cut to the proper length; centre again in the lathe under a microscope; and turn the bearings. A screw so ground has less errors than from any other system of mounting. The periodic error especially will be too small to be discovered, though the mountings and graduation and centering of the head will introduce it; it must therefore finally be corrected.

Mounting of Screws.—The mounting must be devised most carefully, and is indeed more difficult to make without error than the screw itself. The principle which should be adopted is that no workmanship is perfect; the design must make up for its imperfections. Thus the screw can never be made to run true on its bearings, and hence the device of resting one end of the carriage on the nut must be rejected. Also all rigid connexion between the nut and the carriage must be avoided, as the screw can never be adjusted parallel to the ways on which the carriage rests. For many purposes, such as ruling optical gratings, the carriage must move accurately forward in a straight line as far as the horizontal plane is concerned, while a little curvature in the vertical plane produces very little effect. These conditions can be satisfied by making the ways V-shaped and grinding with a grinder somewhat shorter than the ways. By constant reversals and by lengthening or shortening the stroke, they will finally become nearly perfect. The vertical curvature can be sufficiently tested by a short carriage carrying a delicate spirit level. Another and very efficient form of ways is V-shaped with a flat top and nearly vertical sides. The carriage rests on the flat top and is held by springs against one of the nearly vertical sides. To determine with accuracy whether the ways are straight, fix a flat piece of glass on the carriage and rule a line on it by moving it under a diamond; reverse and rule another line near the first, and measure the distance apart at the centre and at the two ends by a micrometer. If the centre measurement is equal to the mean of the two end ones, the line is straight. This is better than the method with a mirror mounted on the carriage and a telescope. The screw itself must rest in bearings, and the end motion be prevented by a point bearing against its flat end, which is protected by hardened steel or a flat diamond. Collar bearings introduce periodic errors. The secret of success is so to

design the nut and its connexions as to eliminate all adjustments of the screw and indeed all imperfect workmanship. The connexion must also be such as to give means of correcting any residual periodic errors or errors of run which may be introduced in the mountings or by the wear of the machine.

The nut is shown in fig. 2. It is made in two halves, of wrought iron filled with boxwood or lignum vitæ plugs, on which the screw is cut. To each half a long piece of sheet steel is fixed which bears against a guiding edge, to be described presently. The two halves are held to the screw by springs, so that each moves forward almost independently of the other. To join the nut to the

carriage, a ring is attached to the latter, vertical and which can turn round a The bars fixed midway on the two halves against this ring at points 90° distant. Hence each half does its share independently in moving the carriage forward. parallelism between the screw and the tricity in the screw mountings thus the forward motion of the carriage. The which the steel pieces of the nut rest can form as to correct any small error of run the screw. Also, by causing it to move forwards periodically, the periodic error mountings can be corrected.

In making gratings for optical purposes error must be very perfectly eliminated, odic displacement of the lines only one-

whose plane is vertical axis. of the nut bear from its axis. ently of the Any want of ways or eccentricity scarcely affects guide against be made of such due to wear of backwards and of the head and

the periodic since the perimillionth of an inch from their mean position will produce "ghosts" in the spectrum.¹ Indeed this is the most sensitive method of detecting the existence of this error, and it is practically impossible to mount the most perfect of screws without introducing it. A very practical method of determining this error is to rule a short grating with very long lines on a piece of common thin plate glass; cut it in two with a diamond and superimpose the two halves with the rulings together and displaced sideways over each other one-half the pitch of the screw. On now looking at the plates in a proper light so as to have the spectral colours show through it, dark lines will appear, which are wavy if there is a periodic error and straight if there is none. By measuring the comparative amplitude of the waves and the distance apart of two lines, the amount of the periodic error can be determined. The phase of the periodic error is best found by a series of trials after setting the corrector at the proper amplitude as determined above.

A machine properly made as above and kept at a constant temperature should be able to make a scale of 6 inches in length, with errors at no point exceeding $\frac{1}{1000000}$ of an inch. When, however, a grating of that length is attempted at the rate of 14,000 lines to the inch, four days and nights are required and the result is seldom perfect, possibly on account of the wear of the machine or changes of temperature. Gratings, however, less than 3 inches long are easy to make. (H. A. R.)

SCRIBE, AUGUSTIN EUGENE (1791-1861), the most popular playwright of France, was born at Paris on 24th December 1791, and died there on 20th February 1861. His father was a silk merchant and he was well educated, being destined for the bar. But, having a real gift for the theatre (a gift which unfortunately was not allied with sufficient literary power to make his works last), he very soon broke away from professional study and at the age of twenty produced, in collaboration, as is common in France, the first of a series of dramas which continued for fifty years. *Les Dervis* (1811) is usually cited as the first play in which he took a hand, though, as for some time he did not sign his work, identification is somewhat difficult. He achieved no distinct success till 1816, when *Une Nuit de Garde Nationale* made him in a way famous. Thenceforward his fertility was unceasing and its results prodigious. There may be in existence a complete list of Scribe's works, but we have never seen any that pretended to be such. He wrote every kind of drama—vaudevilles,

¹ In a machine made by the present writer for ruling gratings the periodic error is entirely due to the graduation and centering of the head. The uncorrected periodic error from this cause displaces the lines $\frac{1}{1000000}$ of an inch, which is sufficient to entirely ruin all gratings made without correcting it.

comedies, tragedies, opera-libretti. To one theatre alone he is said to have furnished more than a hundred pieces. But his life was entirely uneventful, and his election to the Academy in 1834 is almost the only incident which deserves chronicling. It ought to be said to Scribe's credit that, although he was the least original of writers and was more an editor of dramas than a dramatist, although he was for many years an object of the bitterest envy to impecunious geniuses owing to his pecuniary success, and although he never has pleased and never can please any critic who applies purely literary tests, his character stands very high for literary probity and indeed generosity. He is said in some cases to have sent sums of money for "copyright in ideas" to men who not only had not actually collaborated with him but who were unaware that he had taken suggestions from their work. His industry was untiring and his knowledge both of the mechanism of the stage and of the tastes of the audience was wonderful. Nevertheless he hardly deserves a place in literature, his style being vulgar, his characters commonplace, even his plots lacking power and grasp. He wrote a few novels, but none of any mark. The best known of Scribe's pieces after his first successful one are *Une Chaîne* (1842), *Le Verre d'Eau* (1842), *Adrienne Lecouvreur* (1849), and the libretti of many of the most famous operas of the middle of the century, especially those of Auber and Meyerbeer.

SCRIVENER'S PALSY. See CRAMP, vol. vi. p. 543.

SCROFULA or STREUMA (formerly known in England as "king's evil," from the belief that the touch of the sovereign could effect a cure¹), a constitutional morbid condition generally exhibiting itself in early life, and characterized mainly by defective nutrition of the tissues and by a tendency to inflammatory affections of a low type with degenerative changes in their products. The subject has been considered in most of its features under PATHOLOGY (vol. xviii. p. 405), and only a further brief reference is here necessary. Scrofula may be either inherited or acquired. Heredity is of all causes the most potent, and naturally operates with greater certainty where both parents possess the taint. As in all hereditary diseases, however, the liability may be scarcely perceptible for one or two generations, but may then reappear. Other causes referable to parentage may readily produce this constitutional state in children, as weakness or ill health in one or both parents, and, as seems probable, marriages of consanguinity. But, apart altogether from hereditary or congenital influences, the scrofulous habit is frequently developed, especially in the young, by such unfavourable hygienic conditions as result from overcrowding, cold, and dark dwellings, insufficient and improper food, exposure, and debauchery. Even among the old in such circumstances the evidences of scrofula may be seen to present themselves where before they had been absent.

There are two well-marked types of the scrofulous constitution to be often observed, especially among the young. In the one the chief features are a fair complexion with delicate thin skin, blue eyes, dilated pupils, long eyelashes, soft muscles, and activity of the circulatory and nervous system; while in the other the skin is dark, the features heavy, the figure stunted, and all the functions, physical and mental, inactive. In many instances, however, it will be found that both types are more or less mixed together in one individual. The manifestations of scrofula generally appear in early life, and are often exhibited in young

children during the first dentition by inflammatory skin eruptions of obstinate character on the face and other parts; later on in youth there appear glandular swellings either externally, as on the neck, or affecting the gland structures of the chest or abdomen, while at the same time mucous membranes and bones may become implicated. The distinctive features of the scrofulous inflammatory affections are their tendency to chronicity and to suppurative and degenerative changes, the affected parts either healing slowly with resulting disfigurement, as on the neck, or continuing to retain traces of the products of the diseased action, which may set up serious disturbance of the health at some future time. Further, the scrofulous constitution always influences the duration and progress of any disease from which the individual may suffer, as well as its results. Thus in pneumonia, to which the scrofulous would seem to be specially liable, the products of the inflammation are not readily absorbed as in previously healthy persons, but, remaining in the lung-tissues, are apt to undergo caseous degenerative changes, which may issue in phthisis (see PNEUMONIA and PHTHISIS). The connexion of scrofula with tubercle is pointed out in the article PATHOLOGY (*loc. cit.*).

Scrofula may under favourable circumstances tend to improvement as age advances, and it occasionally happens that persons who in early life showed unmistakable evidences of this condition appear ultimately to outgrow it, and become in all respects healthy and vigorous. The treatment is essentially similar to that described for rickets or phthisis, and is partly preventive and partly curative. It consists mainly in hygienic measures to promote the health and nutrition of the young, and of suitable diet, tonics, &c., where evidences of the disease have declared themselves. See RICKETS, PHTHISIS.

SCRUB-BIRD, the name (for want of a better, since it is not very distinctive) conferred upon the members of an Australian genus, one of the most curious ornithological types of the many furnished by that country. The first examples were procured by the late Mr Gilbert between Perth and Augusta in West Australia, and were described by Gould in the Zoological Society's *Proceedings* for 1844 (pp. 1, 2) as forming a new genus and species under the name of *Atrichia clamosa*, the great peculiarity observed by that naturalist being the absence of any bristles around the gape, in which respect alone it seemed to differ from the already known genus *Sphenura*. In March 1866 Mr Wilcox obtained on the banks of the Richmond river on the eastern side of Australia some other examples, which proved the existence of a second species, described by Mr Ramsay in the *Proceedings* for that year (pp. 438-440) as *A. rufescens*; but still no suspicion of the great divergence of the genus from the ordinary Passerine type was raised, and it was generally regarded as belonging to the *Maluridae* or Australian Warblers. However, the peculiar formation of the sternum in *Atrichia* attracted the present writer's attention almost as soon as that of *A. clamosa* was exhibited in the museum of the College of Surgeons, and at his request Mr Ramsay a little later sent to the museum of the university of Cambridge examples in spirit of *A. rufescens*, which shewed a common structure. One of the sternal peculiarities was noticed by Mr Schlater (*Ibis*, 1874, p. 191, note); and in the present work (BIRDS, iii. p. 741) the Scrub-birds were declared to form a distinct Family, *Atrichidae*, standing, so far as was known, alone with the Lyre-birds (see vol. xv. p. 115) as "abnormal *Passeres*." Much the same view was also taken the next year by Garrod, who, in the *Proceedings* for 1876 (pp. 516, 518, pl. lii. figs. 4-7), further dwelt on the taxonomic importance of the equally remarkable characters of the syringeal muscles exhibited alike by *Menura* and *Atrichia*, which he accord-

¹ This superstition can be traced back to the time of Edward the Confessor in England, and to a much earlier period in France. Samuel Johnson was touched by Queen Anne in 1712, and the same prerogative of royalty was exercised by Prince Charles Edward in 1745.

ingly placed together in a division of the Acromyodian *Passeres*, differing from all the rest and since recognized, as has been said (ORNITHOLOGY, vol. xviii. pp. 40, 41), by Mr Schlater as a Sub-order *Pseudoscines*. A detailed anatomical description of *Atrichia* has, however, yet to be given, and a comparison of many other Australian types is needed¹ before it can be certainly said to have no nearer ally than *Menura*. Both the known species of Scrub-bird are about

West-Australian Scrub-bird (*Atrichia clamosa*).

the size of a small Thrush—*A. clamosa* being the larger of the two. This species is brown above, each feather barred with a darker shade; the throat and belly are reddish white, and there is a large black patch on the breast; while the flanks are brown and the lower tail-coverts rufous. *A. rufescens* has the white and black of the fore-parts replaced by brown, barred much as is the upper plumage. Both species are said to inhabit the thickest "scrub" or brushwood forest; but little has been ascertained as to their mode of life except that the males are noisy, imitative of the notes of other birds, and given to violent gesticulations. The nest and eggs seem never to have been found, and indeed no example of the female of either species is known to have been procured, whence that sex may be inferred to escape observation by its inconspicuous appearance and retiring habits. (A. N.)

SCUDÉRY is the name of a family which is said to have been of Italian origin and to have transferred itself to Provence, but which is only known by the singular brother and sister who represented it during the 17th century.

GEORGES DE SCUDÉRY (1601-1667), the elder of the pair, was born at Havre, whither his father had moved from Provence, in 1601. He served in the army for some time, and, though in the vein of gasconading which was almost peculiar to him he no doubt exaggerated his services, there seems little doubt that he was a stout soldier. But he conceived a fancy for literature before he was thirty, and during the whole of the middle of the century he was one of the most characteristic figures of Paris. Despite his own merit, which was not inconsiderable, and his sister's, which was more, he was unlucky in his suits for preferment. Indeed from some stories told by men not his friends he seems to have hurt his own chances by independence of spirit. He received, however, the governorship of the fortress of Notre Dame de la Garde near Marseilles in 1643, and in 1650 was elected to the Academy. Long before he had made

himself conspicuous by a letter attacking Corneille's *Cid*, which he addressed to that body. He was himself an industrious dramatist, *L'Amour Tyrannique* being the chief piece which (and that only partially) has escaped oblivion. His other most famous work was the epic of *Alaric* (1654). He lent his name to his sister's first romances, but did little beyond correcting the proofs. His death occurred at Paris on 14th May 1667. Scudéry's swashbuckler affectations (he terminates his introduction to the works of Théophile de Viaud by something like a challenge in form to any one who does not admit the supremacy of the deceased poet), the bombast of his style, and his various oddities have been rather exaggerated by literary gossip and tradition. Although probably not quite sane, he had some poetical power, a fervent love of literature, a high sense of honour and of friendship.

His sister MADELEINE (1607-1701), born also at Havre in 1607, was a writer of much more ability and of a much better regulated character. She was very plain and had no fortune, but her abilities were great and she was very well educated. Establishing herself at Paris with her brother, she was at once admitted to the Rambouillet coterie, afterwards established a salon of her own under the title of the *Société du Samedi*, and for the last half of the 17th century, under the pseudonym of "Sapho" or her own name, was acknowledged as the first blue-stocking of France and of the world. Her celebrated novels, *Artamène ou le Grand Cyrus*, *Clélie*, *Ibrahim ou l'Illustre Bassa*, *Almahide*, and others are known by quotation to every one, and were the delight of all Europe, including persons of the wit and sense of Madame de Sévigné. But for at least a century and a half they have lain unread, and their immense length has often been satirized even by persons well read in letters with the term "folio," when in fact they were originally issued in batches of small octavos, sometimes (allowing for two parts to each volume) running to a score or so. Neither in conception nor in execution will they bear criticism as wholes. With classical or Oriental personages for nominal heroes and heroines, the whole language and action are taken from the fashionable ideas of the time, and the personages can be identified either really or colourably with Mademoiselle de Scudéry's contemporaries. The interminable length of the stories is made out by endless conversations and, as far as incidents go, chiefly by successive abductions of the heroines, conceived and related in the most decorous spirit, for Mademoiselle de Scudéry is nothing if not decorous. Nevertheless, although the books can hardly now be read through, it is still possible to perceive their attraction for the wits, both male and female, of a time which certainly did not lack wit. In that early day of the novel prolixity did not repel. "Sapho" had really studied mankind in her contemporaries and knew how to analyse and describe their characters with fidelity and point. She was a real mistress of conversation, a thing quite new to the age at least as far as literature was concerned, and proportionately welcome. She could moralize—a favourite employment of the time—with sense and propriety, and the purely literary merits of the style which clothed the whole were considerable. Madeleine survived her brother more than thirty years (scandal says that she was not sorry to be relieved from his humours), and in her later days published numerous volumes of conversations (to a great extent extracted from her novels) and short moral writings. Dryden says that he had heard of an intention on her part to translate the *Canterbury Tales*, and it is not impossible. She never lost either her renown or her wits or her good sense, and died at Paris on 2d June 1701. It is unfortunate and rather surprising that no one has recently attempted an anthology from her immense work.

¹ Forbes shewed that ORTHONYX (vol. xviii. p. 52) did not belong to the group as at one time supposed.

SCULPTURE

THE present article is confined to the sculpture of the Middle Ages and modern times; classical sculpture has been already treated of under ARCHÆOLOGY (CLASSICAL), vol. ii. p. 343 sq., and in the articles on the several individual artists.

In the 4th century A.D., under the rule of Constantine's successors, the plastic arts in the Roman world reached the lowest point of degradation to which they ever fell. Coarse in workmanship, intensely feeble in design, and utterly without expression or life, the pagan sculpture of that time is merely a dull and ignorant imitation of the work of previous centuries. The old faith was dead, and the art which had sprung from it died with it.

In the same century a large amount of sculpture was produced by Christian workmen, which, though it reached no very high standard of merit, was at least far superior to the pagan work. Although it shows no increase of technical skill or knowledge of the human form, yet the mere fact that it was inspired and its subjects supplied by a real living faith was quite sufficient to give it a vigour and a dramatic force which raise it aesthetically far above the expiring efforts of paganism. Fig. 1 shows a very fine Christian relief of the 4th century, with a noble figure of an archangel holding an orb and a sceptre. It is a leaf from an ivory consular diptych, inscribed at the top ΔΕΧΟΥ ΠΑΡΟΝΤΑ ΚΑΙ ΜΑΘΩΝ ΤΗΝ ΑΙΤΙΑΝ, "Receive these presents and having learnt the occasion . . ." A number of large marble sarcophagi are the chief existing specimens of this early Christian sculpture. In general design they are close copies of pagan tombs, and are richly decorated outside with reliefs. The subjects of these are usually scenes from the Old and New Testaments. From the former those subjects were selected which were supposed to have some typical reference to the life of Christ: the Meeting of Abraham and Melchisedec, the Sacrifice of Isaac, Daniel among the Lions, Jonah and the Whale, are those which most frequently occur. Among the New Testament scenes no representations occur of Christ's sufferings;¹ the subjects chosen illustrate His power and beneficence: the Sermon on the Mount, the Triumphal Entry into Jerusalem, and many of His miracles are

Early
Chris-
tian.

FIG. 1.—Relief in ivory of the 4th century. (British Museum.)

frequently repeated. The Vatican and Lateran museums are rich in examples of this sort. One of the finest in the former collection was taken from the crypt of the old basilica of St Peter; it contained the body of a certain Junius Bassus, and dates from the year 359.² Many other similar sarcophagi were made in the provinces of Rome, especially Gaul; and fine specimens exist in the museums of Arles, Marseilles, and Aix; those found in Britain are of very inferior workmanship.

In the 5th century other plastic works similar in style were still produced in Italy, especially reliefs in ivory (to a certain extent imitations of the later consular diptychs), which were used to decorate episcopal thrones or the bindings of MSS. of the Gospels. The so-called chair of St Peter, still preserved (though hidden from sight) in his great basilica, is the finest example of the former class; of less purely classical style, dating from about 550, is the ivory throne of Bishop Maximianus in Ravenna cathedral (see fig. 2). Another very remarkable work of

FIG. 2.—Reliefs in ivory of the Baptist and the Four Evangelists in front of the episcopal throne of Maximianus in Ravenna cathedral.

the 5th century is the series of small panel reliefs on the doors of S. Sabina on the Aventine Hill at Rome. They are scenes from Bible history carved in wood, and in them much of the old classic style survives.³

In the 6th century, under the Byzantine influence of Justinian, a new class of decorative sculpture was produced, especially at Ravenna. Subject reliefs do not often occur, but large slabs of marble, forming screens, altars, pulpits, and the like, were ornamented in a very skilful and original way with low reliefs of graceful vine-plants, with peacocks and other birds drinking out of chalices, all treated in a very able and highly decorative manner (see fig. 3 and the upper band of fig. 2). Byzantium, however, in the main, became the birthplace and

Byzan-
tine.

FIG. 3.—Sixth-century decorative capital from S. Vitale at Ravenna.

¹ A partial exception to this rule is the scene of Christ before Pilate, which sometimes occurs.

² See Dionysius, *Sac. Vat. Bas. Crypt.*, and Bunsen, *Besch. d. Stadt Rom*, 1840.

³ Various dates have been assigned to these interesting reliefs by different archaeologists, but the costumes of the figures are strong evidence that they are not later than the 5th century.

seat of all the mediæval arts soon after the transference thither of the headquarters of the empire. The plastic arts of Byzantium were for a while dominated by the survival of the dull classic art of the extreme decadence, but soon fresh life and vigour of conception were gained by a people who were not without the germinating seeds of a new æsthetic development. The bronze statue of St Peter in his Roman basilica is an early work which shows some promise of what was to come in the far-off future; though classical in its main lines and stiff in treatment, it possesses a simple dignity and force which were far beyond the powers of any mere copyist of classic sculpture.¹ Very early in the 5th or 6th century a school of decorative sculpture arose at Byzantium which produced work, such as carved foliage on capitals and bands of ornament, possessed of the very highest decorative power and executed with unrivalled spirit and vigour. The early Byzantine treatment of the acanthus or thistle, as seen in the capitals of S. Sophia at Constantinople, the Golden Gate at Jerusalem, and many other buildings in the East, has never since been surpassed in any purely decorative sculpture; and it is interesting to note how it grew out of the dull and lifeless ornamentation which covers the degraded Corinthian capital used so largely in Roman buildings of the time of Constantine and his sons. It was, however, especially in the production of METAL-WORK (*q.v.*) that the early Byzantines were so famous, and this notably in the manipulation of the precious metals, which were then used in the most lavish way to decorate and furnish the great churches of the empire. This extended use of gold and silver strongly influenced their sculpture, even when the material was marble or bronze, and caused an amount of delicate surface-ornament to be used which was sometimes injurious to the breadth and simplicity of their reliefs. For many centuries the art of Byzantium, at least in its higher forms, made little or no progress, mainly owing to the tyrannical influence of the church and its growing suspicion of anything like sensual beauty. A large party in the Eastern Church decided that all representations of Christ must be "without form or comeliness," and that it was impious to carve or paint Him with any of the beauty and nobility of the pagan gods. Moreover, the artists of Byzantium were fettered by the strictest rules as to the proper way in which to portray each sacred figure: every saint had to be represented in a certain attitude, with one fixed cast of face and arrangement of drapery, and even in certain definitely prescribed colours. No deviation from these rules was permitted, and thus stereotyped patterns were created and followed in the most rigid and conventional manner. Hence in Byzantine art from the 6th to the 12th century a miniature painting in an illuminated MS. looks like a reduced copy of a colossal glass mosaic; and no design had much special relation to the material it was to be executed in: it was much the same whether it was intended to be a large relief sculptured in stone or a minute piece of silver-work for the back of a textus.

Influence of Byzantine art. Till about the 12th century, and in some places much later, the art of Byzantium dominated that of the whole Christian world in a very remarkable way. From Russia to Ireland and from Norway to Spain any given work of art in one of the countries of Europe might almost equally well have been designed in any other. Little or no local peculiarities can be detected, except of course in the methods of execution, and even these were wonderfully similar everywhere. The dogmatic unity of the Catholic Church and its great monastic system, with constant interchange of monkish craftsmen between one country and another,

were the chief causes of this widespread monotony of style. An additional reason was the unrivalled technical skill of the early Byzantines, which made their city widely resorted to by the artist-craftsmen of all Europe,—the great school for learning any branch of the arts.

The extensive use of the precious metals for the chief works of plastic art in this early period is one of the reasons why so few examples still remain,—their great intrinsic value naturally causing their destruction. One of the most important existing examples, dating from the 8th century, is a series of colossal wall reliefs executed in hard stucco in the church of Cividale (Friuli) not far from Trieste. These represent rows of female saints bearing jewelled crosses, crowns, and wreaths, and closely resembling in costume, attitude, and arrangement the gift-bearing mosaic figures of Theodora and her ladies in S. Vitale at Ravenna. It is a striking instance of the almost petrified state of Byzantine art that so close a similarity should be possible between works executed at an interval of fully two hundred years. Some very interesting small plaques of ivory in the library of St Gall show a still later survival of early forms. The central relief is a figure of Christ in Majesty, and closely resembles those in the colossal apse mosaic of S. Apollinare in Classe and other churches of Ravenna; while the figures below the Christ are survivals of a still older time, dating back from the best eras of classic art. A river-god is represented as an old man holding an urn, from which a stream issues, and a reclining female figure with an infant and a cornucopia is the old Roman Tellus or Earth-goddess with her ancient attributes.²

It will be convenient to discuss the sculpture of the mediæval and modern periods under the heads of the chief countries of Europe.

England.—During the Saxon period, when stone buildings were rare and even large cathedrals were built of wood, the plastic arts were mostly confined to the use of gold, silver, and gilt copper. The earliest existing specimens of sculpture in stone are a number of tall churchyard crosses, mostly in the northern provinces and apparently the work of Scandinavian sculptors. One very remarkable example is a tall monolithic cross, cut in sandstone, in the churchyard of Gosforth in Cumberland. It is covered with rudely carved reliefs, small in scale, which are of special interest as showing a transitional state from the worship of Odin to that of Christ. Some of the old Norse symbols and myths sculptured on it occur modified and altered into a semi-Christian form. Though rich in decorative effect and with a graceful outline, this sculptured cross shows a very primitive state of artistic development, as do the other crosses of this class in Cornwall, Ireland, and Scotland, which are mainly ornamented with those ingeniously intricate patterns of interlacing knotwork designed so skilfully by both the early Norse and the Celtic races.³ They belong to a class of art which is not Christian in its origin, though it was afterwards largely used for Christian purposes, and so is thoroughly national in style, quite free from the usual widespread Byzantine influence. Of special interest from their early date—probably the 11th century—are two large stone reliefs now in Chichester cathedral, which are traditionally said to have come from the pre-Norman church at Selsey. They are thoroughly Byzantine in style, but evidently the work of some very ignorant sculptor; they represent two scenes in the Raising of

² On early and mediæval sculpture in ivory consult Gori, *Thesaurus Veterum Diptychorum*, Florence, 1759; Westwood, *Diptychs of Consuls*, London, 1862; Didron, *Images ouvrantes du Louvre*, Paris, 1871; Maskell, *Ivories in the South Kensington Museum*, London, 1872; Wieseler, *Diptychon Quirinianum zu Brescia*, Göttingen, 1868; Wyatt and Oldfield, *Sculpture in Ivory*, London, 1856.

³ See O'Neill, *Sculptured Crosses of Ireland*, London, 1857.

Lazarus¹; the figures are stiff, attenuated, and ugly, the pose very awkward, and the drapery of exaggerated Byzantine character, with long thin folds. To represent the eyes pieces of glass or coloured enamel were inserted; the treatment of the hair in long ropelike twists suggests a metal rather than a stone design (see fig. 4).

FIG. 4.—Relief of Christ at the tomb of Lazarus, now in Chichester cathedral; 11th century, Byzantine style.

Norman period.

During the Norman period sculpture of a very rude sort was much used, especially for the tympanum reliefs over the doors of churches. Christ in Majesty, the Harrowing of Hell, and St George and the Dragon occur very frequently. Reliefs of the zodiacal signs were a common decoration of the richly sculptured arches of the 12th century, and are frequently carved with much power. The later Norman sculptured ornaments are very rich and spirited, though the treatment of the human figure is still very weak.²

Effigies.

The best-preserved examples of monumental sculpture of the 12th century are a number of effigies of knights-templars in the round Temple church in London.³ They are laboriously cut in hard Purbeck marble, and much resemble bronze in their treatment; the faces are clumsy, and the whole figures stiff and heavy in modelling; but they are valuable examples of the military costume of the time, the armour being purely chain-mail. Another effigy in the same church cut in stone, once decorated with painting, is a much finer piece of sculpture of about a century later. The head, treated in an ideal way with wavy curls, has much simple beauty, showing a great artistic advance. Another of the most remarkable effigies of this period is that of Robert, duke of Normandy (d. 1134), in Gloucester cathedral, carved with much spirit in oak, and decorated

with painting (fig. 5). Most rapid progress in all the arts, especially that of sculpture, was made in England in the second half of the 13th and the beginning of the 14th century, largely under the patronage of

FIG. 5.—Effigy in oak of Robert, duke of Normandy, in Gloucester cathedral; once painted and gilt.

handsomely rewarded a large number of English artists, and also imported others from Italy and Spain, though these foreigners took only a secondary position among the painters and sculptors of England. The end of the 13th century was in fact the culminating period of English art, and at this time a very high degree of excellence was reached by purely national means, quite equalling and even surpassing the general average of art on the Continent, except perhaps in France. Even Niccola Pisano could not have surpassed the beauty and technical excellence of the two bronze effigies in Westminster Abbey modelled and cast by William Torell, a goldsmith and citizen of London, shortly before the year 1300. These are on the tombs of Henry III. and Queen Eleanor, and, though the tomb itself of the former is an Italian work of the Cosmati school, there is no trace of foreign influence in the figures. At this time portrait effigies had not come into general use, and both figures are treated in an ideal way.⁴ The crowned head of Henry III., with noble well-modelled features and crisp wavy curls, resembles the conventional royal head on English coins of this and the following century, while the head of Eleanor is of remarkable, almost classic, beauty, and of great interest as showing the ideal type of the 13th century (see fig. 6).

FIG. 6.—Head of the effigy of Queen Eleanor in Westminster Abbey; bronze gilt, by William Torell.

In both cases the drapery is well conceived in broad sculptural folds, graceful and yet simple in treatment. The casting of these figures, which was effected by the *cire perdue* process, is technically very perfect. The gold employed for the gilding was got from Lucca in the shape of the current florins of that time, which were famed for their purity. Torell was highly paid for this, as well as for two other bronze statues of Queen Eleanor, probably of the same design.

Much of the fine 13th-century sculpture was used to Architectural decorate the façades of churches. The grandest example is the west end of Wells cathedral, of about the middle of the century. It is covered with more than 600 figures in the round or in relief, arranged in tiers, and of varying sizes. The tympana of the doorways are filled with reliefs, and above them stand rows of colossal statues of kings and queens, bishops and knights, and saints both male and female.

¹ One of these reliefs is imperfect and has been clumsily mended with a fragment of a third relief, now lost.

² In Norway and Denmark during the 11th and 12th centuries carved ornament of the very highest merit was produced, especially the framework round the doors of the wooden churches; these are formed of large pine planks, sculptured in slight relief with dragons and interlacing foliage in grand sweeping curves,—perfect masterpieces of decorative art, full of the keenest inventive spirit and originality.

³ See Richardson, *Monumental Effigies of the Temple Church*, London, 1843.

⁴ The effigy of King John in Worcester cathedral of about 1216 is an exception to this rule; though rudely executed, the head appears to be a portrait.

female, all treated very skilfully with nobly arranged drapery, and graceful heads designed in a thoroughly architectonic way, with due regard to the main lines of the building they are meant to decorate. In this respect the early mediæval sculptor inherited one of the great merits of the Greeks of the best period: his figures or reliefs form an essential part of the design of the building to which they are affixed, and are treated in a subordinate manner to their architectural surroundings—very different from the sculpture on modern buildings, which usually looks as if it had been stuck up as an afterthought, and frequently by its violent and incongruous lines is rather an impertinent excrescence than an ornament.¹ Peterborough, Lichfield, and Salisbury cathedrals have fine examples of the sculpture of the 13th century: in the chapter-house of the last the spandrels of the wall-arcade are filled with sixty reliefs of subjects from Bible history, all treated with much grace and refinement. To the end of the same century belong the celebrated reliefs of angels in the spandrels of the choir arches at Lincoln, carved in a large massive way with great strength of decorative effect. Other fine reliefs of angels, executed about 1260, exist in the transepts of Westminster Abbey; being high from the ground, they are broadly treated without any high finish in the details.²

Technical
methods
and
materials.

It may here be well to say a few words on the technical methods employed in the execution of mediæval sculpture, which in the main were very similar in England, France, and Germany. When bronze was used—in England as a rule only for the effigies of royal persons or the richer nobles—the metal was cast by the delicate *cire perdue* process, and the whole surface of the figure was then thickly gilded. At Limoges in France a large number of sepulchral effigies were produced, especially between 1300 and 1400, and exported to distant places. These were not cast, but were made of hammered (*repoussé*) plates of copper, nailed on a wooden core and richly decorated with champlevé enamels in various bright colours. Westminster Abbey possesses a fine example, executed about 1300, in the effigy of William of Valence (d. 1296).³ The ground on which the figure lies, the shield, the border of the tunic, the pillow, and other parts are decorated with these enamels very minutely treated. The rest of the copper was gilt, and the helmet was surrounded with a coronet set with jewels, which are now missing. One royal effigy of later date at Westminster, that of Henry V. (d. 1422), was formed of beaten silver fixed to an oak core, with the exception of the head, which appears to have been cast. The whole of the silver disappeared in the time of Henry VIII., and nothing now remains but the rough wooden core; hence it is doubtful whether the silver was decorated with enamel or not; it was probably of English workmanship.

In most cases stone was used for all sorts of sculpture, being decorated in a very minute and elaborate way with gold, silver, and colours applied over the whole surface. In order to give additional richness to this colouring the surface of the stone, often even in the case of external sculpture, was covered with a thin skin of *gesso* or fine plaster mixed with size; on this, while still soft, and over the drapery and other accessories, very delicate and minute patterns were stamped with wooden dies (see MURAL DECORATION, fig. 17), and upon this the gold and colours were applied; thus the gaudiness and monotony of flat smooth surfaces covered with gilding or bright colours were avoided.⁴ In addition to this the borders of drapery and other parts of stone statues were frequently ornamented with crystals and false jewels, or, in a more laborious way, with holes and sinkings filled with polished metallic foil, on which very minute patterns were painted in transparent varnish colours; the whole was then protected from the air by small pieces of transparent glass, carefully shaped to the right size and fixed over the foil in the cavity cut in the stone. It is difficult

now to realize the extreme splendour of this gilt, painted, and jewelled sculpture, as no perfect example exists, though in many cases traces remain of all these processes, and show that they were once very widely applied.⁵ The architectural surroundings of the figures were treated in the same elaborate way. In the 14th century in England alabaster came into frequent use for monumental sculpture; it too was decorated with gold and colour, though in some cases the whole surface does not appear to have been so treated. In his wide use of coloured decoration, as in other respects, the mediæval sculptor came far nearer to the ancient Greek than do any modern artists. Even the use of inlay of coloured glass was common at Athens during the 5th century B.C.,—as, for example, in the plait-band of some of the marble bases of the Erechtheum,—and five or six centuries earlier at Tiryns and Mycenæ.

Another material much used by mediæval sculptors was wood, though, from its perishable nature, comparatively few early examples survive;⁶ the best specimen is the figure of George de Cantelupe (d. 1273) in Abergavenny church. This was decorated with *gesso* reliefs, gilt and coloured in the same way as the stone. The tomb of Prince John of Eltham (d. 1334) at Westminster is a very fine example of the early use of alabaster, both for the recumbent effigy and also for a number of small figures of mourners all round the arcading of the tomb. These little figures, well preserved on the side which is protected by the screen, are of very great beauty and are executed with the most delicate minuteness; some of the heads are equal to the best contemporary work of the son and pupils of Niccolò Pisano. The tomb once had a high stone canopy of open work—arches, canopies, and pinnacles,—a class of architectural sculpture of which many extremely rich examples exist, as, for instance, the tomb of Edward II. at Gloucester, the De Spencer tomb at Tewkesbury, and, of rather later style, the tomb of Lady Eleanor de Percy at Beverley. This last is remarkable for the great richness and beauty of its sculptured foliage, which is of the finest Decorated period and stands unrivalled by any Continental example.

In England purely decorative carving in stone reached Four. its highest point of excellence about the middle of the ^{teenth} century. 14th century,—rather later, that is, than the best period of figure sculpture. WOOD-CARVING (*q.v.*), on the other hand, reached its artistic climax a full century later under the influence of the fully developed Perpendicular style.

The most important effigies of the 14th century are those Effigies. in gilt bronze of Edward III. (d. 1377) and of Richard II. and his queen (made in 1395), all at Westminster. They are all portraits, but are decidedly inferior to the earlier work of William Torell. The effigies of Richard II. and Anne of Bohemia were the work of Nicolas Broker and Godfred Prest, goldsmith citizens of London. Another fine bronze effigy is at Canterbury on the tomb of the Black Prince (d. 1376); though well cast and with carefully modelled armour, it is treated in a somewhat dull and conventional way. The recumbent stone figure of Lady Arundel, with two angels at her head, in Chichester cathedral is remarkable for its calm peaceful pose and the beauty of the drapery. A very fine but more realistic work is the tomb figure of William of Wykeham (d. 1404) in the cathedral at Winchester. The cathedrals at Rochester, Lichfield, York, Lincoln, Exeter, and many other ecclesiastical buildings in England are rich in examples of 14th-century sculpture, used occasionally with great profusion and richness of effect, but treated in strict subordination to the architectural background.

The finest piece of bronze sculpture of the 15th century is the effigy of Richard Beauchamp (d. 1439) in his family chapel at Warwick,—a noble portrait figure, richly decorated with engraved ornaments. The modelling and casting were done by William Austen of London, and the gilding and engraving by a Netherlands goldsmith who

¹ The sculpture on the new Paris opera-house is a striking instance of this; and so, in a small way, are the statues in the new reredos of Westminster Abbey and Gloucester cathedral.

² On the whole, Westminster possesses the most completely representative collection of English mediæval sculpture in an unbroken succession from the 13th to the 16th century.

³ Other effigies from Limoges were imported into England, but no other example now exists in the country.

⁴ In the modern attempts to reproduce the mediæval polychromy these delicate surface reliefs have been omitted; hence the painful results of such colouring as that in Notre Dame and the Sainte Chapelle in Paris and many other "restored" churches, especially in France and Germany.

⁵ On the tomb of Aymer de Valence (d. 1326) at Westminster a good deal of the stamped *gesso* and coloured decoration is visible on close inspection. One of the cavities of the base retains a fragment of glass covering the painted foil, still brilliant and jewel-like in effect.

⁶ The South Kensington Museum possesses a magnificent colossal wood figure of an angel, not English, but Italian work of the 14th century. A large stone statue of about the same date, of French workmanship, in the same museum is a most valuable example of the use of stamped *gesso* and inlay of painted and glazed foil.

had settled in London, named Bartholomew Lambespring, assisted by several other skilful artists.

Sixteenth century.

At the beginning of the 16th century sculpture in England was entering upon a period of rapid decadence, and to some extent had lost its native individuality. The finest series of statues of this period are those of life-size high up on the walls of Henry VII.'s chapel at Westminster and others over the various minor altars. These ninety-five figures, which represent saints and doctors of the church, vary very much in merit: some show German influence, others that of Italy, while a third class are, as it were, "archaistic" imitations of older English sculpture¹ (see fig. 7). In some cases the heads and general pose are graceful, and the drapery dignified, but in the main they are coarse both in design and in workmanship compared with the better plastic art of the 13th and 14th centuries. This decadence of English sculpture caused Henry VII.

Torrigiano.

to invite the Florentine Torrigiano (1472?-1522) to come to England to model and cast the bronze figures for his own magnificent tomb, which still exist in almost perfect preservation. The recumbent effigies of Henry VII. and his queen are fine specimens of Florentine art, well modelled with life-like portrait heads and of very fine technique in the casting. The altar-tomb on which the effigies lie is of black marble, decorated with large medallion reliefs in gilt bronze, each with a pair of saints—the patrons of Henry and Elizabeth of York—of very graceful design. The altar and its large baldacchino and reredos were the work of Torrigiano, but were destroyed during the 17th century. The reredos had a large relief of the Resurrection of Christ executed in painted terra-cotta, as were also a life-sized figure of the dead Christ under the altar-slab and four angels on the top angles of the baldacchino; a number of fragments of these figures have recently been found in the "pockets" of the nave vaulting, where they had been thrown after the destruction of the reredos. Torrigiano's bronze effigy of Margaret of Richmond in the south aisle of the same chapel is a very skilful but too realistic portrait, apparently taken from a cast of the dead face and hands. Another terra-cotta effigy in the Rolls chapel is also, from internal evidence, attributed to the same able Florentine. Another talented Florentine sculptor, Benedetto da Maiano, was invited to England by Cardinal Wolsey to make his tomb; of this only the marble sarcophagus now exists and has been used to hold the body of Admiral Nelson in St. Paul's Cathedral. Another member of the same family, named Giovanni, was the sculptor of the colossal terra-cotta heads of the Cæsars affixed to the walls of the older part of Hampton Court Palace.

Seventeenth century.

During the troublous times of the Reformation sculpture, like the other arts, continued to decline. Of 17th-century monumental effigies that of Sir Francis Vere (d. 1607) in the north transept at Westminster is one of the best, though its design—a recumbent effigy overshadowed by a slab covered with armour, upborne by four kneeling

FIG. 7.—Statue (life-size) of St Thomas of Canterbury in Henry VII.'s chapel, Westminster, once richly coloured.

figures of men-at-arms—is almost an exact copy of the tomb of Engelbert II. of Vianden-Nassau.² The finest bronze statues of this century are those of George Villiers, duke of Buckingham (d. 1628), and his wife at the northeast of Henry VII.'s chapel. The effigy of the duke, in rich armour of the time of Charles I., lies with folded hands in the usual mediæval pose. The face is fine and well modelled and the casting very good. The allegorical figures at the foot are caricatures of the style of Michelangelo, and are quite devoid of merit, but the kneeling statues of the duke's children are designed with grace and pathos. A large number of very handsome marble and alabaster tombs were erected throughout England during the 17th century. The effigies are poor and coarse, but the rich architectural ornaments are effective and often of beautiful materials, alabaster being mixed with various richly coloured marbles in a very skilful way. Nicholas Stone (d. 1647), who worked under the supervision of Inigo Jones, appears to have been the chief English sculptor of his time. The De Vere and Villiers monuments are usually attributed to him.³ One of the best public monuments of London is the bronze equestrian statue of Charles I. at Charing Cross, which was overthrown and hidden during the protectorate of Cromwell, but replaced at the Restoration in 1660. It is very nobly modelled and was produced under Italian influence by a French sculptor called Hubert Le Sœur (d. 1670). The standing bronze statue of James II. behind the Whitehall banqueting room, very poorly designed but well executed, was the work of Grinling Gibbons (1648-1721), a native of Holland, who was chiefly famed for his extraordinary skill in carving realistic fruit and flowers in pear and other white woods. Many rich and elaborate works of his exist at Trinity College, Oxford, at Cambridge, Chatsworth, and several other places in England. In the early part of the 18th century he worked for Sir Christopher Wren, and carved the elaborate friezes of the stalls and screens in St Paul's Cathedral and in other London churches.

During the 18th century English sculpture was mostly in the hands of Flemish and other foreign artists, of whom Roubiliac (1695-1762), Scheemakers (1691-1773), and Rysbrack (1694-1770) were the chief. The ridiculous custom of representing Englishmen of the 18th and 19th centuries in the toga or in the armour of an ancient Roman was fatal alike to artistic merit and eikonic truth; and when, as was often the case, the periwig of the Georgian period was added to the costume of a Roman general the effect is supremely ludicrous. Nollekens (1737-1823), a pupil of Scheemakers, though one of the most popular sculptors of the 18th century, was a man of very little real ability.⁴ John Bacon (1740-1799) was in some respects an abler sculptor. John Flaxman⁵ (1755-1826) was in England the chief initiator of the classical revival. For many years he worked for Josiah Wedgwood, the potter, and designed for him an immense number of vases covered with delicate cameo-like reliefs. Many of these, taken from antique gems and sculpture, are of great beauty, though hardly suited to the special necessities of fictile ware. Flaxman's large pieces of sculpture are of less merit, but some of his marble reliefs are designed with much spirit and classic purity. His illustrations in outline to the poems of Homer, Æschylus, and Dante, based on drawings on Greek vases, have been greatly admired, but

² See Arendt, *Château de Vianden*, Paris, 1884.

³ The Villiers monument is evidently the work of two sculptors working in very opposite styles.

⁴ An interesting account of many English sculptors of this time is given by Smith, *Nollekens and his Time*, London, 1829.

⁵ See Flaxman, *Lectures at the Royal Academy*, London, 1829. His designs on a small scale are the best of his works,—as, for example, the silver shield of Achilles covered with delicate and graceful reliefs.

¹ There were once no less than 107 statues in the interior of this chapel, besides a large number on the exterior; see J. T. Micklethwaite in *Archæologia*, vol. xlvii. pl. x-xii.

they are unfortunately much injured by the use of a thicker outline on one side of the figures,—an unsuccessful attempt to give a suggestion of shadow. Flaxman's best pupil was Baily (1788-1867), chiefly celebrated for his nude marble figure of Eve.

Nineteenth century.

During the first half of the 19th century the prevalence of a cold lifeless pseudo-classic style was fatal to individual talent, and robbed the sculpture of England of all real vigour and spirit. Francis Chantrey (1782-1841) produced a great quantity of sculpture, especially sepulchral monuments, which were much admired in spite of their very limited merits. Allan Cunningham and Henry Weekes worked in some cases in conjunction with Chantrey, who was not wanting in technical skill, as is shown by his clever marble relief of two dead woodcocks. John Gibson (1790-1866) was perhaps after Flaxman the most successful of the English classic school, and produced some works of real merit. He strove eagerly to revive the polychromatic decoration of sculpture in imitation of the *circumlitio* of classical times. His *Venus Victrix*, shown at the exhibition in London of 1862 (a work of about six years earlier), was the first of his coloured statues which attracted much attention. The prejudice, however, in favour of white marble was too strong, and both the popular verdict and that of other sculptors were strongly adverse to the "tinted Venus." The fact was that Gibson's colouring was timidly applied: it was a sort of compromise between the two systems, and thus his sculpture lost the special qualities of a pure marble surface, without gaining the richly decorative effect of the polychromy either of the Greeks or of the mediæval period.¹ The other chief sculptors of the same very inartistic period were Banks, the elder Westmacott (who modelled the Achilles in Hyde Park), R. Wyatt (who cast the equestrian statue of Wellington, lately removed from London), Macdowell, Campbell, Marshall, and Bell.

During the last hundred years a large number of honorary statues have been set up in the Houses of Parliament, Westminster Hall and Abbey, and in other public places in London. Most of these, though modelled as a rule with some scholastic accuracy, are quite dull and spiritless, and, whilst free from the violently bad taste of such men as Bernini or Roubiliac, they lack the force and vigorous originality which go far to redeem what is offensive in the sculpture of the 17th and 18th centuries. The modern public statues of London and elsewhere are as a rule tamely respectable and quite uninteresting. One brilliant exception is the Wellington monument in St Paul's Cathedral, probably the finest plastic work of modern times. It was the work of Alfred Stevens (1817-1875), a sculptor of the highest talent, who lived and died almost unrecognized by the British public. The commission for this monument was given to Stevens after a public competition; and he agreed to carry it out for £20,000,—a quite inadequate sum, as it afterwards turned out. The greater part of his life Stevens devoted to this grand monument, constantly harassed and finally worn out by the interference of Government, want of money, and other difficulties. Though he completed the model, Stevens did not live to see the monument set up,—perhaps fortunately for him, as it has been placed in a small side chapel, where the effect of the whole is utterly destroyed, and its magnificent bronze groups hidden from view. The monument consists of a sarcophagus supporting a recumbent bronze effigy of the duke, over which is an arched marble canopy of late Renaissance style on delicately enriched shafts. At each

end of the upper part of the canopy is a large bronze group, one representing Truth tearing the tongue out of the mouth of Falsehood, and the other Valour trampling Cowardice under foot (see fig. 8). The two virtues are represented

FIG. 8.—Bronze group by Alfred Stevens from the Wellington monument.

by very stately female figures modelled with wonderful beauty and vigour; the vices are two nude male figures treated in a very massive way. The whole is composed with great skill and largeness of style. The vigorous strength and sculptural nobility of these groups recall the style of Michelangelo, but they are far from being a mere imitation of him or any other master. Stevens's work throughout is original and has a very distinct character of its own. He also designed an equestrian statue of the duke to stand on the summit of the monument, but in its present cramped position there is not sufficient room for this.² Owing to the many years he spent on this one work Stevens did not produce much other sculpture. In Dorchester House, Park Lane, there is some of his work, especially a very noble mantelpiece supported by nude female caryatids in a crouching attitude, modelled with great largeness of style. He also designed mosaics to fill the spandrels under the dome of St Paul's. The value of Stevens's work is all the more conspicuous from the feebleness of most of the sculpture of his contemporaries.

In the present generation there are some signs of the development of a better state of the plastic arts. A bronze statue of an Athlete struggling with a Python, by Sir Frederick Leighton, is a work of great merit, almost

¹ Gibson bequeathed his fortune and the models of his chief works to the Royal Academy, where the latter are now crowded in an upper room adjoining the Diploma Gallery. See Lady Eastlake, *Life of Gibson*, London, 1870.

² The great merit of this work can now only be seen at the South Kensington Museum, which possesses Stevens's models and (on a small scale) his design for the whole monument.

worthy to rank with the best examples of any period, and remarkable for a profound knowledge of human anatomy (see fig. 9). Unfortunately the real *cire perdue* process for metal casting is seldom practised in England, and this

FIG. 9.—Bronze statue of an athlete and python, by Sir Frederick Leighton, P.R.A., in the South Kensington Museum.

statue, as well as all other bronze works produced in England, suffers much from the disagreeable surface which results from the rude method of forming the moulds in sand. The colossal bronze lions in Trafalgar Square, designed by Sir Edwin Landseer, are a melancholy example of this.¹

France.—During the 12th and 13th centuries the sculpture of France was, on the whole, the finest in the world, and was there used in the greatest profusion. The façades of large cathedrals were completely covered with sculptured reliefs and thick-set rows of statues in niches. The whole of the front was frequently one huge composition of statuary, with only sufficient purely architectural work to form a background and frame for the sculptured figures. A west end treated like that of Wells cathedral, which is almost unique in England, is not uncommon in France. Even the shafts of the doorways and other architectural accessories were covered with minute sculptured decoration,—the motives of which were often, especially during the 12th century, obviously derived from the metal-work of shrines and reliquaries studded with rows of jewels. The west façade of Poitiers cathedral is one of the richest examples; it has large surfaces covered with foliated carving

and rows of colossal statues, both seated and standing, reaching high up the front of the church. Of the same century (the 12th), but rather later in date, is the very noble sculpture on the three western doors of Chartres cathedral, with fine tympanum reliefs and colossal statues attached to the jamb-shafts of the openings (see fig. 10). These latter figures, with their exaggerated height and the long straight folds of their drapery, are designed with great skill to assist and not to break the main upward lines of the doorways. The sculptors have willingly sacrificed the beauty and proportion of each separate statue for the sake of the architectonic effect of the whole façade. The heads, however, are full of nobility, beauty, and even grace, especially those that are softened by the addition of long wavy curls, which give relief to the general stiffness of the form. The sculptured doors of the north and south aisles of Bourges cathedral are fine examples of the end of the 12th century, and so were the west doors of Notre Dame in Paris till they were hopelessly injured by "restoration." The early sculpture at Bourges is specially interesting from the existence in many parts of its original coloured decoration.

FIG. 10.—Statues on jamb of central west door of Chartres cathedral, 12th century; specially designed to suit vertical lines of columns behind; all once covered with painting and gold.

In France, as in England, the 13th century was the ^{Thirteenth} golden age of sculpture; while still keeping its early dignity ^{and} subordination to its architectural setting, the sculpture reached a very high degree of graceful finish and even sensuous beauty. Nothing could surpass the loveliness of the angel statues round the Parisian Sainte Chapelle, and even the earlier work on the façade of Laon cathedral is full of grace and delicacy. Amiens cathedral is especially rich in sculpture of this date,—as, for example, the noble and majestic statues of Christ and the Apostles at the west end; the sculpture on the south transept of about 1260-70, of more developed style, is remarkable for dignity combined with soft beauty.² The noble row of kings on the west end of Notre Dame at Paris has, like the earlier sculpture, been ruined by "restoration," which has robbed the statues of both their spirit and their vigour. To the latter years of the 13th century belong the magnificent series of statues and reliefs round the three great western doorways of the same church, among which are no less than thirty-four life-sized figures. On the whole, the single statues throughout this period are finer than the reliefs with many figures. Some of the statues of the Virgin and Child are of extraordinary beauty, in spite of their being often treated with a certain mannerism,—a curved pose of the body, which appears to have been copied from ivory statuettes in which the figure followed the curve of the elephant's tusk. The north transept at Rheims is no less rich: the central statue of Christ is a work of much grace and nobility of form; and some nude figures—for example, that of St Sebastian—show a knowledge of the human form which was very unusual at that early date. Many of these Rheims statues, like those by Torell at Westminster, are quite equal to the best work of Niccola Pisano.

Cathedral
façades.

Scott, *British School of Sculpture*, London, 1872; W. M. Rossetti, "British Sculpture," in *Fraser's Mag.*, April 1861; many good illustrations of English mediæval sculpture are scattered throughout the volumes of *Archæologia*, the *Archæological Journal*, and other societies' "Proceedings."

² See Ruskin, *The Bible of Amiens*, 1878.

The abbey church of St Denis possesses the largest collection of French 13th-century monumental effigies, a large number of which, with supposed portraits of the early kings, were made during the rebuilding of the church in 1264; some of them appear to be "archaistic" copies of older contemporary statues.¹

Fourteenth century. In the 14th century French sculpture began to decline, though much beautiful plastic work was still produced. Some of the reliefs on the choir screen of Notre Dame at Paris belong to this period, as does also much fine sculpture on the transepts of Rouen cathedral and the west end of Lyons. At the end of this century an able sculptor from the Netherlands, called Claux Sluter, executed much fine work, especially at Dijon, under the patronage of Philip the Bold, for whose newly founded Carthusian monastery in 1399 he sculptured the great "Moses fountain" in the cloister, with six life-sized statues of prophets in stone, painted and gilt in the usual mediæval fashion.

Fifteenth century. Not long before his death in 1411 Sluter completed a very magnificent altar tomb for Philip the Bold, now in the museum at Dijon. It is of white marble, surrounded with arcading, which contains about forty small alabaster figures representing mourners of all classes, executed with much dramatic power. The recumbent portrait effigy of Philip in his ducal mantle with folded hands is a work of great power and delicacy of treatment.

The latter part of the 15th century in France was a time of transition from the mediæval style, which had gradually been deteriorating, to the more florid and realistic taste of the Renaissance. To this period belong a number of rich reliefs and statues on the choir-screen of Chartres cathedral. Those on the screen at Amiens are later still, and exhibit the rapid advance of the new style. Fig. 11 shows a statuette in the costume of the end of the 15th century, a characteristic example of the later mediæval method of treating saints in a realistic way.

Sixteenth century. In the 16th century Italian influence, especially that of Benvenuto Cellini, was paramount in France. Jean Goujon (d. 1572) was the ablest French sculptor of the time; he combined great technical skill and refinement of modelling with the florid and affected style of the age. His nude figure of Diana reclining by a Stag, now in the Louvre, is a graceful and vigorous piece of work, superior in sculptural breadth to the somewhat similar bronze relief of a nymph by Cellini. Between 1540 and 1552 Goujon executed the fine monument at Rouen to Duke Louis de Brézé, and from 1555 to 1562 was mainly occupied in decorating the Louvre with sculpture. One of the most pleasing and graceful works of this period, thoroughly Italian in style, is the marble group of the Three Graces bearing on their heads an urn containing the heart of Henry II., executed in 1560 by Germain Pilon for Catherine de' Medici. The monument of Catherine and Henry II. at St Denis, by the same sculptor, is an inferior and coarser work. Maître Ponce, probably the same as the Italian Ponce Jacquo, chiselled the noble monument of Albert of Carpi (1535), now in the Louvre. Another very fine portrait effigy of about 1570, a recumbent figure in full armour of the duke of Montmorency, preserved in the Louvre, is the work of

FIG. 11.—Statuette of St Mary Magdalene, late 15th century; French work, painted and gilt.

Barthélemy Prieur. François Duquesnoy of Brussels (1594-1644), usually known as Il Fiamingo, was a clever sculptor, thoroughly French in style, though he mostly worked in Italy. His large statues are very poor, but his reliefs in ivory of boys and cupids are modelled with wonderfully soft realistic power and graceful fancy.

No sculptor of any great merit appears to have arisen in France during the 17th century, though some, such as

Seventeenth century.

the two Coustous, had great technical skill. Pierre Puget (1622-1694) produced vigorous but coarse and tasteless work, such as his *Milodevoured by a Lion*. Other sculptors of the time were Simon Guillain, François and Michel Anguier, and Chas. Ant. Coyzevox (1640-1720), the last a sculptor of Lyons who produced some fine portrait busts. Fig. 12 shows a group by Clodion, whose real name was Claude Michel (c. 1745-1814). He worked largely in terra-cotta, and modelled with great spirit and invention, though in the sensual unsculpturesque manner prevalent in his time.

FIG. 12.—Bacchanal group by Clodion in terra-cotta.

In the following century Jean Antoine Houdon (1740-1828), a sculptor of most exceptional power, produced some works of the highest merit at a time when the plastic arts had reached a very low ebb. His standing colossal statue of S. Bruno in S. Maria degli Angeli at Rome is a most noble and stately piece of portraiture, full of commanding dignity and expression. His seated statue of Voltaire in the *foyer* of the Théâtre Français, though sculptural in treatment, is a most striking piece of lifelike realism. Houdon may in fact be regarded as the precursor of the modern school of French sculpture of the better sort. About the middle of the 18th century a revolution was brought about in the style of sculpture by the suddenly revived taste for antique art. A period of dull pseudo-classicism succeeded, which in most cases stifled all original talent and reduced the plastic arts to a lifeless form of archaeology. Regarded even as imitations the works of this period are very unsuccessful: the sculptors got hold merely of the dry bones not of the spirit of classic art; and their study of the subject was so shallow and unintelligent that they mostly picked out what was third-rate for special admiration and ignored the glorious beauty of the best works of true Hellenic art. Thus in sculpture, as in painting and architecture, a study which might have been stimulating and useful in the highest degree became a serious hindrance to the development of modern art, and this not only in France but in the other countries of Europe; in France, however, the victories of Napoleon I. and his arrogant pretension to create a Gaulish empire on the model of that of ancient Rome caused the taste for

¹ See Félibien, *Histoire de l'Abbaye de Saint-Denis*, Paris, 1706.

pseudo-Roman art to be more pronounced than elsewhere. Among the first sculptors of this school were Antoine Chaudet (1763-1810) and Joseph Bosio (1769-1845). The latter was largely employed by Napoleon I.: he executed with some ability the bronze spiral reliefs round the column of the Place Vendôme and the statue of Napoleon on the top, and also modelled the classical quadriga on the triumphal arch in the Place du Carrousel. Jacques Pradier of Geneva (1790-1852) produced the Chained Prometheus of the Louvre and the Niobe group (1822). He possessed great technical ability, but aimed in most of his works at a soft sensuous beauty which is specially unsuited to sculpture. François Rude (1784-1855) worked in a style modelled on Græco-Roman sculpture treated with some freedom. His bronze Mercury in the Louvre is a clever work, but his statues of Marshal Ney in the Luxembourg Gardens and of General Cavaignac (1847) in the cemetery of Montmartre are conspicuously bad. The reliefs on the pediment of the Panthéon are by Pierre Jean David of Angers (1789-1856); his early works are of dull classic style, but later in life he became a realist and produced the most unsculpturesque results. A bronze statue of a Dancing Fisher-lad modelled by François Joseph Duvet, now in the Luxembourg collection, is an able work of the *genre* class. Other French sculptors who were highly esteemed in their time were Ottin, Courtet, Simart, Etex, and Carpeaux.¹ The last was an artist of great ability, and produced an immense number of clever but often very offensive statues. He obtained the highest renown in France, and was a typical example of the sad degradation of taste which prevailed under the rule of Napoleon III.

Modern
era.

The existing schools of French sculpture are by far the most important in the world. Technical skill and intimate knowledge of the human form are possessed by several living sculptors of France to a degree which has probably never been surpassed, and some of them produce works of very great power, beauty, and originality. Many of their works have a similar fault to that of one class of French painters: they are much injured by an excess of sensual realism; in many cases nude statues are simply life-studies with all the faults and individual peculiarities of one model. Very unsculpturesque results are produced by treating a statue as a representation of a *naked* person,—one, that is, who is obviously in the habit of wearing clothes,—a very different thing from the purity of the ancient Greek treatment of the nude. Thus the great ability of many French sculptors is degraded to suit the taste of the voluptuary. An extravagance of attitude and an undignified arrangement of the figures do much to injure some of the large groups which are full of technical merit, and executed with marvellous anatomical knowledge. This is specially the case with much of the sculpture that is intended to decorate the buildings of Paris. The group of nude dancers by Carpeaux outside the new opera-house is a work of astonishing skill and prurient imagination, utterly unsculpturesque in style and especially unfitted to decorate the comparatively rigid lines of a building. The egotism of modern French sculptors will not allow them to accept the necessarily subordinate reserve which is so necessary for architectonic sculpture. Other French works, on the other hand, err in the direction of a sickly sentimentalism, or a petty realism, which is fatal to sculpturesque beauty. The real power and merits of the modern French school make these faults all the more conspicuous.²

Germany.—Till the 12th century sculpture in Germany continued to be under the lifeless influence of Byzantium, tempered to some extent by an attempt to return to classical models. This is seen in the bronze pillar reliefs and other works produced by Bishop Bernward after his visit to Rome (see METAL-WORK, vol. xvi. p. 77). Hildesheim, Cologne, and the whole of the Rhine provinces were the most active seats of German sculpture, especially in metal, till the 12th century. Many remarkable pieces of bronze sculpture were produced at the end of that period, of which several specimens exist. The bronze font at Liège, with figure-subjects in relief of various baptismal scenes from the New Testament, by Lambert Patras of Dinant, cast about 1112, is a work of most wonderful beauty and perfection for its time; other fonts in Osnabrück and Hildesheim cathedrals are surrounded by spirited reliefs, fine in conception, but inferior in beauty to those on the Liège font. Fine bronze candelabra exist in the abbey church of Comburg and at Aix-la-Chapelle, the latter of about 1165. Merseburg cathedral has a strange realistic sepulchral figure of Rudolf of Swabia, executed about 1100; and at Magdeburg is a fine effigy, also in bronze, of Bishop Frederick (d. 1152), treated in a more graceful way. The last figure has a peculiarity which is not uncommon in the older bronze reliefs of Germany: the body is treated as a relief, while the head sticks out and is quite detached from the ground in a very awkward way. One of the finest plastic works of this century is the choir screen of Hildesheim cathedral, executed in hard stucco, once rich with gold and colours; on its lower part is a series of large reliefs of saints modelled with almost classical breadth and nobility, with drapery of especial excellence.

In the 13th century German sculpture had made considerable artistic progress, but it did not reach the high standard of France. One of the best examples is the "golden gate" of Freiburg cathedral, with sculptured figures on the jambs after the French fashion. The statues of the apostles on the nave pillars, and especially one of the Madonna at the east end (1260-70), possess great beauty and sculpturesque breadth. The statues both inside and outside Bamberg cathedral, of the middle of the 13th century, are nobly designed; and an equestrian statue of Conrad III. in the market-place at Bamberg, supported by a foliated corbel, exhibits startling vigour and originality, and is designed with wonderful largeness of effect, though small in scale. The statues of Henry the Lion and Queen Matilda at Brunswick, of about the same period, are of the highest beauty and dignity of expression. Strasburg cathedral, though sadly damaged by restoration, still possesses a large quantity of the finest sculpture of the 13th century. One tympanum relief of the Death of the Virgin, surrounded by the sorrowing Apostles, is a work of the very highest beauty, worthy to rank with the best Italian sculpture of even a later period. Of its class nothing can surpass the purely decorative carving at Strasburg, with varied realistic foliage studied from nature, evidently with the keenest interest and enjoyment.

Nuremberg is rich in good sculpture of the 14th century. The church of St Sebald, the Frauenkirche, and the west façade of St Lawrence are lavishly decorated with reliefs and statues, very rich in effect, but showing the germs of

Fourteenth century.

that mannerism which grew so strong in Germany during the 15th century. Of special beauty are the statuettes which adorn the "beautiful fountain," executed by Heinrich der Balier (1385-1396), and richly decorated with gold and colour by the painter Rudolf.¹ A number of colossal figures were executed for Cologne cathedral between 1349 and 1361, but they are of no great merit. Augsburg produced several sculptors of ability about this time; the museum possesses some very noble wooden statues of this school, large in scale and dignified in treatment. On the exterior of the choir of the church of Marienburg castle is a very remarkable colossal figure of the Virgin of about 1340-50. Like the Hildesheim choir screen, it is made of hard stucco and is decorated with glass mosaics. The equestrian bronze group of St George and the Dragon in the market-place at Prague is excellent in workmanship and full of vigour, though much wanting dignity of style. Another fine work in bronze of about the same date is the effigy of Archbishop Conrad (d. 1261) in Cologne cathedral, executed many years after his death. The portrait appears truthful and the whole figure is noble in style. The military effigies of this time in Germany as elsewhere were almost unavoidably stiff and lifeless from the necessity of representing them in plate armour; the ecclesiastical chasuble, in which priestly effigies nearly always appear, is also a thoroughly unsculpturesque form of drapery, both from its awkward shape and its absence of folds. Fig. 13 shows a characteristic example of these sepulchral effigies in slight relief. It is interesting to compare this with a somewhat similarly treated

FIG. 13.—Sepulchral effigy in low relief of Günther of Schwarzburg (d. 1349), in Frankfort cathedral.

Florentine effigy, executed in marble at the beginning of the next century, but of very superior grace and delicacy of treatment (see fig. 16 below).

Fifteenth century. The 15th century was one of great activity and originality in the sculpture of Germany and produced many artists of very high ability. One speciality of the time was the production of an immense number of wooden altars and reredoses, painted and gilt in the most gorgeous way and covered with subject-reliefs and statues, the former often treated in a very pictorial style.² Wooden screens, stalls, tabernacles, and other church-fittings of the greatest elaboration and clever workmanship were largely produced in Germany at the same time, and on into the 16th century.³ Jörg Syrlin, one of the most able of these sculptors in wood, executed the gorgeous choir-stalls in Ulm cathedral, richly decorated with statuettes and canopied work, between 1469 and 1474; his son and namesake sculptured

the elaborate stalls in Blaubeuren church of 1493 and the great pulpit in Ulm cathedral. Veit Stoss of Nuremberg, though a man of bad character, was a most skilful sculptor in wood; he carved the high altar, the tabernacle, and the stalls of the Frauenkirche at Cracow, between 1472 and 1495. One of his finest works is a large piece of wooden panelling, nearly 6 feet square, carved in 1495, with central reliefs of the Doom and the Heavenly Host, framed by minute reliefs of scenes from Bible history. It is now in the Nuremberg town-hall. Wohlgemuth (1434-1519), the master of A. Dürer, was not only a painter but also a clever wood-carver, as was also Dürer himself (1471-1528), who executed a tabernacle for the Host with an exquisitely carved relief of Christ in Majesty between the Virgin and St John, which still exists in the chapel of the monastery of Landau. Dürer also produced miniature reliefs cut in boxwood and hone-stone, of which the British Museum (print room) possesses one of the finest examples. Adam Kraft (c. 1455-1507) was another of this class of sculptors, but he worked also in stone; he produced the great Schreyer monument (1492) for St Sebald's at Nuremberg, —a very skilful though mannered piece of sculpture, with very realistic figures in the costume of the time, carved in a way more suited to wood than stone, and too pictorial in effect. He also made the great tabernacle for the Host, 80 feet high, covered with statuettes, in Ulm cathedral, and the very spirited "Stations of the Cross" on the road to the Nuremberg cemetery.

The Vischer family of Nuremberg for three generations Vischer were among the ablest sculptors in bronze during the 15th and 16th centuries. Hermann Vischer the elder worked mostly between 1450 and 1505, following the earlier mediæval traditions, but without the originality of his son. Among his existing works the chief are the bronze font at Wittenberg church (1457) and four episcopal effigies in relief, dated from 1475 to 1505, in Bamberg cathedral; this church also contains a fine series of bronze sepulchral monuments of various dates throughout the 15th and 16th centuries. Hermann's son Peter Vischer was the chief artist of the family; he was admitted a master in the sculptor's guild in 1489, and passed the greater part of his life at Nuremberg, where he died in 1529. In technique few bronze sculptors have ever equalled him; but his designs are marred by an excess of mannered realism and a too exuberant fancy. His chief early work was the tomb of Archbishop Ernest in Magdeburg cathedral (1495), surrounded with fine statuettes of the apostles under semi-Gothic canopies; it is purer in style than his later works, such as the magnificent shrine of St Sebald at Nuremberg, a tall canopied bronze structure, crowded with reliefs and statuettes in the most lavish way. The general form of the shrine is Gothic,⁴ but the details are those of the 16th-century Italian Renaissance treated with much freedom and originality. Some of the statuettes of saints attached to the slender columns of the canopy are modelled with much grace and even dignity of form. A small portrait figure of Peter himself, introduced at one end of the base, is a marvel of clever realism: he has represented himself as a stout, bearded man, wearing a large leathern apron and holding some of the tools of his craft. In this work, executed from 1508 to 1519, Peter was assisted by his sons, as is recorded in an inscription on the base—"Petter Vischer, Purger zu Nürnberg, machet das Werck mit seinen Sunnen, und ward folbracht im Jar MDXIX . . ." This gorgeous shrine is a remarkable example of the uncommercial spirit which animated the artists of that time,

¹ See Baader, *Beiträge zur Kunstgesch. Nürnbergs*; and Rettberg, *Nürnbergers Kunstleben*, Stuttgart, 1854.

² This class of large wooden retable was much imitated in Spain and Scandinavia. The metropolitan cathedral of Roskilde in Denmark possesses a very large and magnificent example covered with subject reliefs enriched with gold and colours.

³ See Waagen, *Kunst und Künstler in Deutschl.*, Leipsic, 1843-45.

⁴ This great work is really a canopied pedestal to support and enclose the shrine, not the shrine itself, which is a work of the 14th century, having the gabled form commonly used in the Middle Ages for metal reliquaries.

and of the evident delight which they took in their work. Dragons, grotesques, and little figures of boys, mixed with graceful scroll foliage, crowd every possible part of the canopy and its shafts, designed in the most free and unconventional way and executed with an utter disregard of the time and labour which were lavished on them. Other existing works by Peter Vischer and his sons are the Entombment relief, signed "P. V. 1522," in the Aegidienkirche, the monument of Cardinal Albert (1525) in the church at Aschaffenburg, and the fine tomb of Frederick the Wise (1527) in the castle chapel at Wittenberg.

Innsbruck.

Next to Nuremberg, the chief centres of bronze sculpture were Augsburg and Lübeck. Innsbruck possesses one of the finest series of bronze statues of the first half of the 16th century, namely twenty-eight colossal figures round the tomb of the emperor Maximilian, which stands in the centre of the nave, representing a succession of heroes and ancestors of the emperor. The first of the statues which was completed cost 3000 florins, and so Maximilian invited the help of Peter Vischer, whose skill was greater and whose work less expensive than that of the local craftsmen. Most of them, however, were executed by sculptors of whom little is now known. They differ much in style, though all are of great technical merit. The finest (see fig. 14) is an ideal statue of King Arthur of Britain, in plate armour of the 14th or early 15th century, very remarkable for the nobility of the face and pose. That of Theodoric is also a very fine conception. Some of the portrait figures of the Hapsburgs are almost ludicrously realistic, and are disfigured by the ugly German armour of the time.

FIG. 14.—Bronze statue of King Arthur at Innsbruck.

From
sixteenth
century
onwards.

In the latter part of the 16th century the influence of the later Italian Renaissance becomes very apparent, and many elaborate works in bronze were produced, especially at Augsburg, where Hubert Gerhard cast the fine "Augustus fountain" in 1593, and Adrian de Vries made the "Hercules fountain" in 1599; both were influenced by the style of Giovanni di Bologna, as shown in his magnificent fountain at Bologna.

In the following century Andreas Schlüter of Hamburg (b. about 1662) produced smaller bronze reliefs and accessories of great merit. His colossal statue of Frederick III. on the bridge at Berlin is less successful. On the whole the 17th and 18th centuries in Germany, as, in England, were periods of great decadence in the plastic art; little of merit was produced, except some portrait figures. In the second half of the 18th century there was a strong revival in sculpture, especially in the classic style; and since then Germany has produced an immense quantity of large and pretentious sculpture, mostly dull in design and second-rate in execution. Johann Gottfried of Berlin (1764-1850) finished a number of portrait figures,

some of which are ably modelled, as did also Friedrich Tieck (1776-1851) and Christian Rauch (1777-1857); the works of Rauch are, however, mostly weak and sentimental in style, as, for example, his recumbent statue of Queen Louisa at Charlottenburg (1813) and his statues of Generals Bülow and Scharnhorst at Berlin. Friedrich Drake was the ablest of Rauch's pupils, but he lived at a very unhappy period for the sculptor's art. His chief work is perhaps the colossal bronze equestrian statue of King William of Prussia at Cologne. Albert Wolff was a sculptor of more ability; he executed the equestrian portrait of King Ernest Augustus at Hanover, and a Horseman attacked by a Lion now in the Berlin Museum. Augustus Kiss (1802-1865) produced the companion group to this, the celebrated Amazon and Panther in bronze, as well as the fine group of St George and the Dragon in a courtyard of the royal palace at Berlin. The St George and his horse are of bronze; the dragon is formed of gilt plates of hammered iron. Kiss worked only in metal. The bad taste of the first half of the present century is strongly shown by many of the works of Theodore Kalide, whose Bacchanal sprawling on a Panther's Back is a marvel of awkwardness of pose and absence of any feeling for beauty. Rietschel was perhaps the best German sculptor of this period, and produced work superior to that of his contemporaries, such as Haagen, Wichmann, Fischer, and Hiedel. Some revival of a better style is shown in some sculpture, especially reliefs, by Hänel, whose chief works are at Dresden. Schwanthaler (1802-1848), who was largely patronized by King Louis of Bavaria, studied at Rome and was at first a feeble imitator of antique classic art, but later in life he developed a more romantic and pseudo-medieval style. By him are a large number of reliefs and statues in the Glyptothek at Munich and in the Walhalla, also the colossal but feeble bronze statue of Bavaria, in point of size one of the most ambitious works of modern times.¹ Since the beginning of the second half of the century the sculpture of Germany has made visible progress, and several living artists have produced works of merit and originality, far superior to the feeble imitations of classic art which for nearly a century destroyed all possible vigour and individuality in the plastic productions of most European countries.²

Spain.—In the early mediæval period the sculpture of northern Spain was much influenced by contemporary art in France. From the 12th to the 14th century many French architects and sculptors visited and worked in Spain. The cathedral of Santiago de Compostella possesses one of the grandest existing specimens in the world of late 12th-century architectonic sculpture; this, though the work of a native artist, Mastei Mateo,³ is thoroughly French in style; as recorded by an inscription on the front, it was completed in 1188. The whole of the western portal with its three doorways is covered with statues and reliefs, all richly decorated with colour, part of which still remains. Round the central arch are figures of the twenty-four elders, and in the tympanum a very noble relief of Christ in Majesty between Saints and Angels. As at Chartres, the jamb-shafts of the doorways are decorated with standing statues of saints,—St James the elder, the patron of the church, being attached to the

¹ In size, but not in merit, this enormous statue has recently been surpassed by the figure of America made in Paris and now (1886) being erected as a beacon at the entrance to the harbour of New York City.

² On German sculpture see Foerster, *Denkmale deutscher Baukunst*, Leipzig, 1855; Wanderer, *Adam Kraft and his School*, Nuremberg, 1868; Raabe, *Das Grabmal des J. von Brandenburg . . . von P. Vischer*, Berlin, 1843; Reindel, *Vischer's Shrine of St Sebaldus*, Nuremberg, 1855; Lübke, *Hist. of Sculpt.*, Eng. trans., London, 1872.

³ A kneeling portrait-statue of Mateo is introduced at the back of the central pier. This figure is now much revered by the Spanish peasants, and the head is partly worn away with kisses.

central pillar. These noble figures, though treated in a somewhat rigid manner, are thoroughly subordinate to the main lines of the building. Their heads, with pointed beards and a fixed mechanical smile, together with the stiff drapery arranged in long narrow folds, recall the Æginetan pediment sculpture of about 500 B.C. This appears strange at first sight, but the fact is that the works of the early Greek and the mediæval Spaniard were both produced at a somewhat similar stage in two far distant periods of artistic development. In both cases plastic art was freeing itself from the bonds of a hieratic archaism, and had reached one of the last steps in a development which in the one case culminated in the perfection of the Phidian age, and in the other led to the exquisitely beautiful yet simple and reserved art of the end of the 13th and early part of the 14th century,—the golden age of sculpture in France and England.

In the 14th century the silversmiths of Spain produced many works of sculpture of great size and technical power. One of the finest, by a Valencian called Peter Bernec, is the great silver retable at Gerona cathedral. It is divided into three tiers of statuettes and reliefs, richly framed in canopied niches, all of silver, partly cast and partly hammered.

In the 15th century an infusion of German influence was mixed with that of France, as may be seen in the very rich sculptural decorations which adorn the main door of Salamanca cathedral, the façade of S. Juan at Valladolid, and the church and cloisters of S. Juan de los Reyes at Toledo, perhaps the most gorgeous examples of architectural sculpture in the world. The carved foliage of this period is of especial beauty and spirited execution; realistic forms of plant-growth are mingled with other more conventional foliage in the most masterly manner. The very noble bronze monument of Archdeacon Pelayo (d. 1490) in Burgos cathedral was probably the work of Simon of Cologne, who was also architect of the Certosa at Miraflores, 2 miles from Burgos. The church of this monastery contains two of the most magnificently rich monuments in the world, especially the altar-tomb of King John II. and his queen by Gil de Siloe,—a perfect marvel of rich alabaster canopy-work and intricate under-cutting. The effigies have little merit.

In the early part of the 16th century a strong Italian influence superseded that of France and Germany, partly owing to the presence in Spain of the Florentine Torrigiano and other Italian artists. The magnificent tomb of Ferdinand and Isabella in Granada cathedral is a fine specimen of Italian Renaissance sculpture, somewhat similar in general form to the tomb of Sixtus IV. by Ant. Pollaiuolo in St Peter's, but half a century later in the style of its detail. It looks as if it had been executed by Torrigiano, but the design which he made for it is said to have been rejected. Some of the work of this period, though purely Italian in style, was produced by Spanish sculptors,—for example, the choir reliefs at Toledo cathedral, and those in the Colegio Mayor at Salamanca by Alonso Berruguete, who obtained his artistic training in Rome and Florence. Esteban Jordan, Gregorio Hernandez, and other Spanish sculptors produced a large number of elaborate retables, carved in wood with subjects in relief and richly decorated in gold and colours. These sumptuous masses of polychromatic sculpture resemble the 15th-century retables of Germany more than any Italian examples, and were a sort of survival of an older mediæval style. Alonso Cano (1600-1667), the painter, was remarkable for clever realistic sculpture, very highly coloured and religious in style. Montañes, who died in 1614, was one of the ablest Spanish sculptors of his time. His finest works are the reliefs of the Madonna

and Saints on an altar in the university church of Seville, and in the cathedral, in the chapel of St Augustine, a very nobly designed Conception, modelled with great skill. In later times Spain has produced little or no sculpture of any merit.

Italy.—Till the great revival of plastic art took place in the middle of the 13th century, the sculpture of Italy was decidedly inferior to that of other more northern countries. Much of it was actually the work of northern sculptors,—as, for example, the very rude sculpture on the façade of S. Andrea at Pistoia, executed about 1186 by Gruamons and his brother Adeodatus.¹ Fig. 15 shows a

FIG. 15.—Relief by Benedetto Antelami for the pulpit of Parma cathedral in 1178; Byzantine style.

relief by Antelami of Parma of the year 1178. Unlike the sculpture of the Pisani and later artists, these early figures are thoroughly secondary to the architecture they are designed to decorate; they are evidently the work of men who were architects first and sculptors in a secondary degree. After the 13th century the reverse was usually the case, and, as at the west end of Orvieto cathedral, the sculptured decorations are treated as being of primary importance,—not that the Italian sculptor-architect ever allowed his statues or reliefs to weaken or damage their architectural surroundings, as is unfortunately the case with much modern sculpture. In southern Italy, during the 13th century, there existed a school of sculpture resembling that of France, owing probably to the Norman occupation. The pulpit in the cathedral of Ravenna, executed by Nicolaus di Bartolomeo di Foggia in 1272, is an important work of this class; it is enriched with very noble sculpture, especially a large female head crowned with a richly foliated coronet, and combining lifelike vigour with largeness of style in a very remarkable way. The bronze doors at Monreale, Pisa, and elsewhere, which are among the chief works of plastic art in Italy during the 12th century, are described in MONREALE and METAL-WORK. The history of Italian sculpture of the best period is given to a great extent in the separate articles on the PISANI (q.v.) and other Italian artists. During the 13th century Rome and the central provinces of Italy produced very few sculptors of ability, almost the only men of note being the Cosmati (see ROME, vol. xx. p. 835).

During the 14th century Florence and the neighbouring cities were the chief centres of Italian sculpture, and there numerous sculptors of successively increasing artistic power lived and worked, till in the 15th century Florence had become the æsthetic capital of the world, and reached a pitch of artistic wealth and perfection which Athens

¹ The other finest examples of this early class of sculpture exist at Pisa, Parma, Modena, and Verona; in most of them the old Byzantine influence is very strong.

alone in its best days could have rivalled. The similarity between the plastic arts of Athens in the 5th or 4th century B.C. and of Florence in the 15th century is not one of analogy only. Though free from any touch of copyism, there are many points in the works of such men as Donatello, Luca della Robbia, and Vittore Pisanello which strongly recall the sculpture of ancient Greece, and suggest that, if a sculptor of the later Phidian school had been surrounded by the same types of face and costume as those among which the Italians lived, he would have produced plastic works closely resembling those of the great Florentine masters. In the 14th century, in northern Italy, various schools of sculpture existed, especially at Verona and Venice, whose art differed widely from the contemporary art of Tuscany; but Milan and Pavia, on the other hand, possessed sculptors who followed closely the style of the Pisani. The chief examples of the latter class are the magnificent shrine of St Augustine in the cathedral of Pavia, dated 1362, and the somewhat similar shrine of Peter the Martyr (1339), by Balduccio of Pisa, in the church of St Eustorgio at Milan, both of white marble, decorated in the most lavish way with statuettes and subject reliefs. Many other fine pieces of the Pisan school exist in Milan. The well-known tombs of the Scaliger family at Verona show a more native style of design, and in general form, though not in detail, suggest the influence of transalpine Gothic. In

Venice the northern and almost French character of much of the early 15th-century sculpture is more strongly marked, especially in the noble figures in high relief which decorate the lower story and angles of the doge's palace;¹ these are mostly the work of a Venetian named Bartolomeo Bon. A magnificent marble tympanum relief by Bon has recently been added to the South Kensington Museum; it has a noble colossal figure of the Madonna, who shelters under her mantle a number of kneeling worshippers; the background is enriched with foliage and heads, forming a "Jesse tree," designed with great decorative skill. The cathedral of Como, built at the very end of the 15th century, is decorated with good sculpture of almost Gothic style, but on the whole rather dull and mechanical in detail, like much of the sculpture in the extreme north of Italy. A large quantity of rich sculpture was produced in Naples during the 14th century, but of

no great merit either in design or in execution. The lofty monument of King Robert (1350), behind the high altar of S. Chiara, and other tombs in the same church

FIG. 16.—Florentine marble effigy in low relief in the church of the Certosa near Florence.

are the most conspicuous works of this period. Very beautiful sepulchral effigies in low relief were produced in many parts of Italy, especially at Florence. The tomb of Lorenzo Acciaiuoli (see fig. 16), in the Certosa near Florence, is a fine example of about the year 1400, which has absurdly been attributed to Donatello. Rome was very remarkable during the 14th century for its extraordinary poverty in the production of sculpture. The clumsy effigies at the north-east of S. Maria in Trastevere are striking examples of the degradation of the plastic art there about the year 1400; and it was not till nearly the middle of the century that the arrival of able Florentine sculptors, such as Filarete, Mino da Fiesole, and the Pollaiuoli, initiated a brilliant era of artistic activity, which, however, for about a century continued to depend on the presence of sculptors from Tuscany and other northern provinces. It was not, in fact, till the period of full decadence had begun that Rome itself produced any notable artists.

For the great sculptors of Florence during the 14th and 15th centuries we refer the reader to the separate biographical notices on the subject. The Pisani and Arnolfo del Cambio were succeeded by Orcagna and others, who carried on and developed the

Fifteenth century.

Florence. tistery gates; Donatello, the master of delicate relief and dignified realism (see fig. 17); Luca della Robbia, with his classic purity of style and sweetness of expression, came next in order. Unsensual beauty elevated by religious spirit was attained in the highest degree by Mino da Fiesole, the two Rossellini, Benedetto da Maiano, and other sculptors of Florence. Two of the noblest equestrian statues the world has probably ever seen are the Gattamelata statue at Padua by Donatello and the statue of Colleoni at Venice by Verrocchio and Leopardi (see fig. 18). A third, which was probably of equal beauty, was modelled in clay by Leonardo da Vinci, but it no longer exists. Finally came Michel-

angelo, who raised the sculpture of the modern world to its highest pitch of magnificence, and at the same time sowed the seeds of its rapidly approaching decline; the head of his David (see fig. 19) is a work of unrivalled force and dignity. His rivals and imitators, Baccio Bandinelli, Giacomo

FIG. 19.—Head of the colossal statue of David by Michelangelo at Florence.

della Porta, Montelupo, Ammanati, Vincenzo de' Rossi, and others, copied and exaggerated his faults without possessing a touch of his gigantic genius. In other parts of Italy, such as Pavia, the traditions of the 15th century lasted longer, though gradually fading. The statuary and reliefs which make the Certosa near Pavia one of the most gorgeous buildings in the world are free from the influence of Michelangelo, which at Florence and Rome was overwhelming. Though much of the sculpture was begun in the second half of the 15th century, the greater part was not executed till much later. The magnificent tomb of the founder, Giovanni Galeazzo Visconti, was not completed till about 1560, and is a gorgeous example of the style of the Renaissance grown weak from excess of richness and from loss of the simple purity of the art of the 15th century. Everywhere in this wonderful building the fault is the same; and the growing love of luxury and display, which was the curse of the time, is reflected in the plastic decorations of the whole church. The old religious spirit had died out and was succeeded by unbelief or by an affected revival of paganism. Monuments to ancient Romans, such as those to the two Plinys on the façade of Como cathedral, or "heroa" to unsaintly mortals, such as that erected at Rimini by Sigismondo Pandolfo in honour of Isotta,¹ grew up side by side with shrines and churches dedicated to the saints. We have seen how the youthful vigour of the Christian faith vivified for a time the dry bones of expiring classic art, and now the decay of this same belief brought with it the destruction of all that was most valuable in mediæval sculpture. Sculpture like the other arts became the bond-slave of the rich and ceased to be the natural expression of a whole people. Though for a long time in Italy great technical skill continued to exist, the vivifying spirit was dead, and at last a dull scholasticism or a riotous extravagance of design became the leading characteristics.

¹ See Yriarte, *Rimini au XVme Siècle*, Paris, 1880; also the article **RIMINI**.

The 16th century was one of transition to this state of Sixteenth century degradation, but nevertheless produced many sculptors of great ability who were not wholly crushed by the declining taste of their time. John of Douay (1524-1608), usually known as Giovanni da Bologna, one of the ablest, lived and worked almost entirely in Italy. His bronze statue of Mercury flying upwards, in the Uffizi, one of his finest works, is full of life and movement. By him also is the Carrying off of a Sabine Woman in the Loggia de' Lanzi. His great fountain at Bologna, with two tiers of boys and mermaids, surmounted by a colossal statue of Neptune, a very noble work, is composed of architectural features combined with sculpture, and is remarkable for beauty of proportion. He also cast the fine bronze equestrian statue of Cosimo de' Medici at Florence and the very richly decorated west door of Pisa cathedral, the latter much injured by the over-crowding of its ornaments and the want of sculptural dignity in the figures; it is a feeble copy of Ghiberti's noble production. One of Giovanni's best works, a group of two nude figures fighting, is now lost. A fine copy in lead existed till recently in the front quadrangle of Brasenose College, Oxford, of which it was the chief ornament (see fig. 20). In 1881 it was sold for old lead by the principal and fellows of the college, and was immediately melted down by the plumber who bought it—a quite irreparable loss, as the only other existing copy is very inferior; the destruction was an utterly inexcusable act of vandalism. The sculpture on the western façade of the church at Loreto and the elaborate bronze gates of the Santa Casa are works of great technical merit by Girolamo Lombardo and his sons, about the middle of the 16th century. Benvenuto Cellini (1500-1569), though in the main a poor sculptor, produced one work of great beauty and dignity,—the colossal bronze Perseus at Florence (see fig. 21). His large bust of Cosimo de' Medici in the Bargello is mean and petty in style. A number of very clever statues and groups in terra-cotta were modelled by Antonio Begarelli of Modena (d. 1565), and were enthusiastically admired by Michelangelo; the finest are a Pietà in S. Maria Pomposa and a large Descent from the Cross in S. Francesco,

FIG. 20.—Group by Giovanni da Bologna, formerly in Brasenose College, Oxford; destroyed in 1881.

FIG. 21.—Bronze statue of Perseus and Medusa by Cellini, in the Loggia de' Lanzi at Florence.

both at Modena. The colossal bronze seated statue of Julius III. at Perugia, cast in 1555 by Vincenzo Danti, is one of the best portrait-figures of the time.

Seven-
teenth
century.

The chief sculptor and architect of the 17th century was the Neapolitan Bernini (1598-1680), who, with the aid of a large school of assistants, produced an almost incredible quantity of sculpture of the most varying degrees of merit and hideousness. His chief early group, the Apollo and Daphne in the Borghese casino, is a work of wonderful technical skill and delicate high finish, combined with soft beauty and grace, though too pictorial in style. In later life Bernini turned out work of brutal coarseness,¹ designed in a thoroughly unsculpturesque spirit. The churches of Rome, the colonnade of St Peter's, and the bridge of S. Angelo are crowded with his clumsy colossal figures, half draped in wildly fluttering garments,—perfect models of what is worst in the plastic art. And yet his works received perhaps more praise than those of any other sculptor of any age, and after his death a scaffolding was erected outside the bridge of S. Angelo in order that people might walk round and admire his rows of feeble half-naked angels. For all that, Bernini was a man of undoubted talent, and in a better period of art would have been a sculptor of the first rank; many of his portrait-busts are works of great vigour and dignity, quite free from the mannered extravagance of his larger sculpture. Stefano Maderna (1571-1636) was the ablest of his contemporaries; his clever and much admired statue, the figure of the dead S. Cecilia under the high altar of her basilica, is chiefly remarkable for its deathlike pose and the realistic treatment of the drapery. Another clever sculptor was Alessandro Algardi of Bologna (1598?-1654).

Eight-
eenth
century.

In the next century at Naples Queirolo, Corradini, and Sammartino produced a number of statues, now in the chapel of S. Maria de' Sangri, which are extraordinary examples of wasted labour and ignorance of the simplest canons of plastic art. These are marble statues enmeshed in nets or covered with thin veils, executed with almost deceptive realism, perhaps the lowest stage of tricky degradation into which the sculptor's art could possibly fall.² In the 18th century Italy was naturally the headquarters of the classical revival, which spread thence throughout most of Europe. Canova (1757-1822), a Venetian by birth, who spent most of his life in Rome, was perhaps the leading spirit of this movement, and became the most popular sculptor of his time. His work is very unequal in merit, mostly dull and uninteresting in style, and is occasionally marred by a meretricious spirit very contrary to the true classic feeling. His group of the Three Graces, the Hebe, and the very popular Dancing-Girls, copies of which in plaster disfigure the stairs of countless modern hotels and other buildings on the Continent, are typical examples of Canova's worst work. Some of his sculpture is designed with far more of the purity of antique art; his finest work is the colossal group of Theseus slaying a Centaur at Vienna (see fig. 22). Canova's attempts at Christian sculpture are singularly unsuccessful, as, for example, his pretentious monument to Pope Clement XIII. in St Peter's at Rome, that to Titian at Venice, and Alfieri's tomb in the Florentine church of S. Croce. Fiesole has in this century produced one sculptor of great talent, named Bastianini. He worked in the style of the great 15th-century Florentine sculptors, and followed especially the methods of his distinguished fellow-townsmen Mino da

Fiesole. Many of Bastianini's works are hardly to be distinguished from genuine sculpture of the 15th century, and in some cases enormous prices have been paid for

Fig. 22.—Colossal marble group of Theseus and a centaur, by Canova, at Vienna.

them under the supposition that they were mediæval productions. These frauds were, however, perpetrated without Bastianini's knowledge.

Scandinavia, &c.—By far the greatest sculptor of the Scandinavian revival was Bertel Thorwaldsen (1770-1844), an Icelander by race, whose boyhood was spent at Copenhagen, and who settled in Rome in 1797, when Canova's fame was at its highest point.³ He produced an immense quantity of groups, single statues, and reliefs, chiefly Greek and Roman deities, many of which show more of the true spirit of antique art than has been attained by any other modern sculptor. His group of the Three Graces is for purity of form and sculptural simplicity far superior to that of the same subject by Canova. No sculptor's works have ever been exhibited as a whole in so perfect a manner as Thorwaldsen's; they are collected in a fine building which has been specially erected to contain them at Copenhagen; he is buried in the courtyard. The Swedish sculptors Tobias Sergell and Johann Byström belonged to the classic school; the latter followed in Thorwaldsen's footsteps. Another Swede named Fogelberg was famed chiefly for his sculptured subjects taken from Norse mythology. W. Bissen and Jerichau of Denmark have produced some able works,—the former a fine equestrian statue of Frederick VII. at Copenhagen, and the latter a very spirited and widely known group of a Man attacked by a Panther.

Within recent years Russia, Poland, and other countries have produced many sculptors, most of whom belong to the modern German or French schools. Rome is still a favourite place of residence for the sculptors of all countries, but can hardly be said to possess a school of its own. The sculptors of America almost invariably study at one of the great European centres of plastic art, especially in Paris. Hiram Powers of Cincinnati, who produced one work of merit, a nude female figure, called the Greek Slave, exhibited in London in 1851, lived and worked in Florence. A number of living American sculptors now reside both there and in Rome.⁴

¹ The Ludovisi group of Pluto carrying off Proserpine is a striking example, and shows Bernini's deterioration of style in later life. It has nothing in common with the Cain and Abel or the Apollo and Daphne of his earlier years.

² In the present century an Italian sculptor named Monti won much popular repute by similar unworthy tricks; some veiled statues by him in the London Exhibition of 1851 were greatly admired.

TECHNICAL METHODS OF THE SCULPTOR.

Cire perdue. The production of bronze statues by the *cire perdue* process is described in the article METAL-WORK, vol. xvi. p. 72; this is now but little practised out of Paris.

Clay model. For the execution of a marble statue the sculptor first models a preliminary sketch on a small scale in clay or wax. He then, in the case of a life-sized or colossal statue, has a sort of iron skeleton set up, with stout bars for the arms and legs, fixed in the pose of the future figure. This is placed on a stand with a revolving top, so that the sculptor can easily turn the whole model round and thus work with the light on any side of it. Over this iron skeleton well-tempered modelling-clay is laid and is modelled into shape by the help of wood and bone tools; without the ironwork a soft clay figure, if more than a few inches high, would collapse with its own weight and squeeze the lower part out of shape. While the modelling is in progress it is necessary to keep the clay moist and plastic, by squirting water on to it with a sort of garden syringe capped with a finely perforated rose. When the sculptor is not at work the whole figure is kept wrapped up in damp cloths. A modern improvement is to mix the modelling-clay, not with water, but with stearin and glycerin; this, while keeping the clay soft and plastic, has the great advantage of not being wet, and so the sculptor avoids the chill and consequent risk of rheumatism which follow from a constant manipulation of wet clay. When the clay model is finished it is cast in plaster. A "piece-mould"¹ is formed by applying patches of wet plaster of Paris all over the clay statue in such a way that they can be removed piecemeal from the model, and then be fitted together again, forming a complete hollow mould. The inside is then rinsed out with plaster and water mixed to the consistency of cream till a skin of plaster is formed all over the inner surface of the mould, and thus a hollow cast is made of the whole figure. The "piece-mould" is then taken to pieces and the casting set free. If skilfully done by a good *formatore* or moulder the plaster cast is a perfect facsimile of the original clay, very slightly disfigured by a series of lines showing the joints in the piece-mould, the sections of which cannot be made to fit together with absolute precision. Many sculptors have their clay model cast in plaster before the modelling is quite finished, as they prefer to put the finishing touches on the plaster cast,—good plaster being a very easy and pleasant substance to work on.

Pointing the marble. The next stage is to copy the plaster model in marble. The model is set on a large block called a "scale stone," while the marble for the future statue is set upon another similar block. The plaster model is then covered with a series of marks, placed on all the most salient parts of the body, and the front of each "scale stone" is covered with another series of points, exactly the same on both stones. An ingenious instrument called a pointing machine, which has arms ending in metal points or "needles" that move in ball-socket joints, is placed between the model and the marble block. Two of its arms are then applied to the model, one touching a point on the scale stone while the other touches a mark on the figure. The arms are fixed by screws in this position, and the machine is then revolved to the marble block, and set with its lower needle touching the corresponding point on the scale stone. The upper needle, which is arranged to slide back on its own axis, cannot reach the corresponding point on the statue because the marble block is in the way; a hole is then drilled into the block at the place and in the direction indicated by the needle, till the latter can slide forward so as to reach a point sunk in the marble block exactly corresponding to the point it touched on the plaster mould. This process is repeated both on the model and on the marble block till the latter is drilled with a number of holes, the bottoms of which correspond in position to the number of marks made on the surface of the model. A comparatively un-

skilled *scarpellino* or "chisel-man" then sets to work and cuts away the marble till he has reached the bottoms of all the holes, beyond which he must not cut. The statue is thus roughly blocked out, and a more skilled *scarpellino* begins to work. Partly by eye and the scar partly with the constant help of the pointing machine, which is pallino. used to give any required measurements, the workman almost completes the marble statue, leaving only the finishing touches to be done by the sculptor.

Among the ancient Greeks and Romans and in the mediæval Polish on period it was the custom to give the nude parts of a marble statue marble, a considerable degree of polish, which really suggests the somewhat glossy surface of the human skin very much better than the dull loaf-sugar-like surface which is left on the marble by modern sculptors. This high polish still remains in parts of the pedimental figures from the Parthenon, where, at the back, they have been specially protected from the weather. The Hermes of the Vatican Belvedere is a remarkable instance of the preservation of this polish. Michelangelo carried the practice further still, and gave certain parts of some of his statues, such as the Moses, the highest possible polish in order to produce high lights just where he wanted them; the artistic legitimacy of this may perhaps be doubted, and in weaker hands it might degenerate into mere trickery. It is, however, much to be desired that modern sculptors should to some extent at least adopt the classical practice, and by a slight but uniform polish remove the disagreeable crystalline grain from all the nude parts of the marble.

A rougher method of obtaining fixed points to measure from was occasionally employed by Michelangelo and earlier sculptors. They immersed the model in a tank of water, the water being gradually allowed to run out, and thus by its sinking level it gave a series of contour lines on any required number of planes. In some cases Michelangelo appears to have cut his statue out of the marble without previously making a model—a most marvellous feat of skill.

In modelling bas-reliefs the modern sculptor usually applies the Relief clay to a slab of slate on which the design is sketched; the slate sculpts the background of the figures, and thus keeps the relief true, absolutely true to one plane. This method is one of the causes of the dullness and want of spirit so conspicuous in most modern sculptured reliefs. In the best Greek examples there is no absolutely fixed plane surface for the backgrounds. In one place, to gain an effective shadow, the Greek sculptor would cut below the average surface; in another he would leave the ground at a higher plane, exactly as happened to suit each portion of his design. Other differences from the modern mechanical frieze can easily be seen by a careful examination of the Parthenon frieze and other Greek reliefs. Though the word "bas-relief" is now often applied to reliefs of all degrees of projection from the ground, it should, of course, only be used for those in which the projection is slight; "basso," "mezzo," and "alto rilievo" express three different degrees of salience. Very low relief is but little used by modern sculptors, mainly because it is much easier to obtain striking effects with the help of more projection. Donatello and other 15th-century Italian artists showed the most wonderful skill in their treatment of very low relief. One not altogether legitimate method of gaining effect was practised by some mediæval sculptors: the relief itself was kept very low, but was "stilted" or projected from the ground, and then undercut all round the outline. A 15th-century tabernacle for the host in the Brera at Milan is a very beautiful example of this method, which as a rule is not pleasing in effect, since it looks rather as if the figures were cut out in cardboard and then stuck on.

The practice of most modern sculptors is to do very little to the Sculpture marble with their own hands; some, in fact, have never really learnt how to carve, and thus the finished statue is often very assistants. dull and lifeless in comparison with the clay model. Most of the great sculptors of the Middle Ages left little or nothing to be done by an assistant; Michelangelo especially did the whole of the carving with his own hands, and when beginning on a block of marble attacked it with such vigorous strokes of the hammer that large pieces of marble flew about in every direction. But skill as a carver, though very desirable, is not absolutely necessary for a sculptor. If he casts in bronze by the *cire perdue* process he may produce the most perfect plastic works without touching anything harder than the modelling-wax. The sculptor in marble, however, must be able to carve a hard substance if he is to be master of his art. Unhappily some modern sculptors not only leave all manipulation of the marble to their workmen, but they also employ men to do their modelling, the supposed sculptor supplying little or nothing but his name to the work. In some cases sculptors who are neither one nor the other, but who suffer under an excess of popularity, are induced to employ aid of this kind on account of their undertaking more work than any one man could possibly accomplish,—a state of things which is necessarily very hostile to the interests of true art. As a rule, however, the sculptor's *scarpellino*, though he may and often does attain the highest skill as a carver and can copy almost anything with wonderful fidelity, seldom develops into an original artist. The popular admiration

¹ Moulds made in one or few pieces, from which the cast can only be extracted by destroying the mould, are called "spoil-moulds." A large number of casts can be made from a "piece-mould," but only one from a "spoil-mould."

for pieces of clever trickery in sculpture, such as the carving of the open meshes of a fisherman's net, or a chain with each link free and movable, would perhaps be diminished if it were known that such work as this is invariably done, not by the sculptor, but by the *scarpellino*. Unhappily at the present day there is, especially in England, little appreciation of what is valuable in plastic art; there is probably no other civilized country where the state does so little to give practical support to the advancement of monumental and decorative sculpture on a large scale—the most important branch of the art—which it is hardly in the power of private persons to further.

Literature.—On the general history of Christian sculpture, see Agincourt, *Histoire de l'Art*, Paris, 1823; Du Sommerard, *Les Arts au Moyen-Âge*, Paris, 1839-46; Cicognara, *Storia della Scultura*, Prato, 1828-44; Westmacott, *Handbook of Sculpture*, Edinburgh, 1864; Lübke, *History of Sculpture*, Eng. trans., London, 1872; Ruskin, *Aratra Pentelici* (six lectures on sculpture), London, 1873; Viardot, *Les Merveilles de la Sculpture*, Paris, 1869; Arsenne and Denis, *Manuel . . . du Sculpteur*, Paris, 1858; Clarac, *Musée de Sculpture*, Paris, 1826-53; Demmin, *Encyclopédie des Beaux-Arts plastiques*, Paris, 1872-75, vol. iii.; Didron, *Catres de Bronzes du Moyen-Âge*, Paris, 1859; Fortnum, *Bronzes in the South Kensington Museum*, 1877; Finocchietti, *Scultura in Legno*, Florence, 1873; Anon., *Ornati del Coro di S. Pietro de' Cassinesi a Perugia*, Rome, 1845. See also the lists of works given in the preceding pages, and those in the articles on individual sculptors and in that on METAL-WORK. (J. H. M.)

SCURVY, or SCORBUTUS, a morbid condition of the blood, manifesting itself by marked impairment of the nutritive functions and by the occurrence of hæmorrhagic extravasations in the tissues of the body, and depending on the absence of certain essential ingredients in the food.

In former times this disease was extremely common among sailors, and gave rise to a frightful amount of mortality. It is now, however, of rare occurrence at sea, its cause being well understood and its prevention readily secured by simple measures. Scurvy has also frequently broken out among soldiers on campaign, in beleaguered cities, as well as among communities in times of scarcity, and in prisons, workhouses, and other public institutions. In all such instances it has been found to depend closely upon the character and amount of the food. It has been supposed that a too limited diet, either in amount or variety, might induce the disease; but an overwhelming weight of evidence goes to prove that the cause resides in the inadequate supply or the entire want of fresh vegetable matter. The manner in which this produces scurvy is not quite clear. Some high authorities have held that the insufficient supply of potash salts, in which vegetables are rich, is the procuring cause; but it has been found that the mere administration of these salts will neither prevent nor cure scurvy. Hence, while it is probable that this may be one of the factors concerned in the production of the disease, the want of other vegetable constituents, especially vegetable acids, is of still greater importance. Besides this essential defect, a diminution in the total amount of food, the large use of salted meat or fish, and all causes of a depressing kind, such as exposure, anxiety, bad hygiene, &c., will powerfully contribute to the development of the disease. See DIETETICS, vol. vii. pp. 207-208.

The symptoms of scurvy come on gradually, and its onset is not marked by any special indications beyond a certain failure of strength, most manifest on making effort. Breathlessness and exhaustion are thus easily induced, and there exists a corresponding mental depression. The countenance acquires a sallow or dusky hue; the eyes are sunken; while pains in the muscles of the body and limbs are constantly present. The appetite and digestion may be unimpaired in the earlier stages and the tongue comparatively clean, but the gums are tender and the breath offensive almost from the first. These preliminary symptoms may continue for weeks, and in isolated cases may readily escape notice, but can scarcely fail to attract attention where they affect large numbers of men. In the further stages of the disease all these phenomena are aggravated in a high degree and the physical and mental prostration soon becomes extreme. The face looks haggard; the gums are livid, spongy, ulcerating, and bleeding; the teeth are loosened and drop out; and the breath is excessively fetid. Extravasations of blood now take place in the skin and other textures. These may be small like the petechial spots of purpura (see PURPURA), but are often of large amount and cause swellings of the muscles in which they occur, having the appearance of extensive bruises and tending to become hard and brawny. These extravasations are most common in the muscles of the lower extremities; but they may be formed anywhere, and may

easily be produced by very slight pressure upon the skin or by injuries to it. In addition, there are bleedings from mucous membranes, such as those of the nose, eyes, and alimentary or respiratory tracts, while effusions of blood-stained fluid take place into the pleural, pericardial, or peritoneal cavities. Painful, extensive, and destructive ulcers are also apt to break out in the limbs. Peculiar disorders of vision have been noticed, particularly night-blindness (nyctalopia), but they are not invariably present, nor specially characteristic of the disease. The further progress of the malady is marked by profound exhaustion, with a tendency to syncope, and with various complications, such as diarrhoea and pulmonary or kidney troubles, any or all of which may bring about a fatal result. On the other hand, even in desperate cases, recovery may be hopefully anticipated when the appropriate remedy can be obtained. The composition of the blood is materially altered in scurvy, particularly as regards its albumen and its red corpuscles, which are diminished, while the fibrine is increased.

No disease is more amenable to treatment both as regards prevention and cure than scurvy, the single remedy of fresh vegetables or some equivalent securing both these ends. Potatoes, cabbages, onions, carrots, turnips, &c., and most fresh fruits, will be found of the greatest service for this purpose. Lime juice and lemon juice are recognized as equally efficacious, and even vinegar in the absence of these will be of some assistance. The regulated administration of lime juice in the British navy, which has been practised since 1795, has had the effect of virtually extinguishing scurvy in the service, while similar regulations introduced by the British Board of Trade in 1865 have had a like beneficial result as regards the mercantile marine. It is only when these regulations have not been fully carried out, or when the supply of lime juice has become exhausted, that scurvy among sailors has been noticed in recent times. Besides the administration of lime or lemon juice and the use of fresh meat, milk, &c., which are valuable adjuvants, the local and constitutional conditions require the attention of the physician. The ulcers of the gums and limbs can be best treated by stimulating astringent applications; the hard swellings, which are apt to continue long, may be alleviated by fomentations and frictions; while the anæmia and debility are best overcome by the continued administration of iron tonics, aided by fresh air and other measures calculated to promote the general health.

SCUTAGE or ESCUAGE was one of the forms of knight-service (see KNIGHTHOOD, REAL ESTATE). It was practically a composition for personal service. When levied on a knight's fee it was called scutage uncertain, as its amount depended upon the present needs of the crown. Scutage certain was a socage tenure, and consisted in the payment of a sum fixed in amount and payable at regular times. Scutage appears to have been first imposed on the occasion of the Toulouse War in 1159. Magna Charta (§ 12) forbade the levy of scutage unless *per commune consilium regni*. It appears to have fallen into disuse in the reign of Edward II., and was finally done away with by the Act abolishing feudal tenures (12 Car. II. c. 24).

SCUTARI (Turkish, *Üsküdar*), anciently *Chrysopolis*, a seaport town of Turkey in Asia, on the eastern shore of the Bosphorus, opposite Constantinople (see plan, vol. vi. p. 305), of which it is regarded as a suburb. Climbing the slopes of several hills in the form of an amphitheatre, its houses generally painted in red, distinguished by a number of mosques adorned with numerous minarets, possessing some fine bazaars and public baths, and merging farther inland into burying-grounds, gardens, and villas, Scutari presents a very picturesque appearance, especially when viewed from the bridge of the Golden Horn or approached from the Straits of Constantinople right in front of its most prominent point. The inhabitants are largely engaged in the manufacture of saddlery and silk, muslin, and cotton stuffs; the town also contains granaries and is prized as a fruit-market, more particularly for grapes, lemons, and figs. The population is estimated at 60,000 (entirely Mohammedan, with the exception of some Jews). The streets, especially the main street leading from the pier to the barracks, are in general much wider than those of Constantinople. The city includes eight mosques. Behind the landing-place is the *Büyük Jami* (great mosque), surmounted by a cupola and a minaret and presenting terraces mammillated by small leaden domes. The centre of the square is adorned by a fountain of simple architecture. The mosque of Selim III., farther in the interior of the city, is likewise flanked by two minarets and surmounted by a cupola. The most elegant mosque, however, is the *Valide Jami* or mosque of the dowager sultana, surmounted by two minarets, built in 1547 by the daughter of Solyman. Another prominent mosque, on the right of the main street and south of *Büyük Jami*, is *Jeni Jami* (new mosque). Other noticeable buildings are the barracks built by Selim III., forming a handsome and vast quadrangle surmounted by a tower at each angle, and whose corridors, &c., are calculated to have an aggregate length of 4 miles; an old large red building now used as a military hospital, and during the Crimean War as a hospital for the English sick and wounded; a seraglio of the sultans; a convent of howling dervishes, a simple wooden structure of two stories fronting a small cemetery. Other business quarters of the town deserving mention are *Jeni Mahalle* (new quarter) and the *Dohanjilar Mejdanı* (tobacco merchants' square). The most characteristic feature, however, of Scutari is its immense cemetery, the largest and most beautiful of all the cemeteries in and around Constantinople, extending over more than 3 miles of undulating plain behind the town.¹ In the centre of the ground rises the magnificent dome, supported by six marble pillars, which Sultan Mohammed erected in memory of his favourite horse. Close to the barracks, on the Bosphorus, the scene of Miss Nightingale's labours, 8000 English dead are overshadowed by a large granite obelisk. Immediately behind the town is the mountain of *Bulgurlu* clad in evergreen savins and red beeches, one of the plateaus of which is a favourite holiday resort. Its summit commands a very extensive view. In the plain of *Haidar Pasha* close by, between the cemetery and *Kadikoi* (judge's village, anciently *Chalcedon*), the English army lay encamped during the Crimean War. In front of Scutari, on a low-

lying rock almost level with the water and about a cable's length from the shore, rises a white tower 90 feet high, now used as a lighthouse, called "*Leander's Tower*," and by the Turks *Kiz-kulesi*, or the "*Maiden's Tower*." The first printing press in Turkey was set up at Scutari in 1723.

Its ancient name *Chrysopolis* most probably has reference to the fact that there the Persian tribute was collected and repositied, as at a later date the Athenians levied there too a tenth on the ships passing from the Euxine. Its more modern name of *Üsküdar*, signifying a courier who conveys the royal orders from station to station, commemorates the fact that formerly Scutari was the post station for Asiatic couriers, as it is still the great rendezvous and point of departure of caravans arriving from and destined for Syria, Persia, and other parts of Asia, and the spot whence all travellers and pilgrims from Constantinople to the East begin their journeys.

SCUTARI (Turkish, *Scodra*; Slavic, *Skadar*), the capital of North Albania, at the south end of the lake of the same name, with a population of 24,500 in 1880 (mostly Mohammedans). There is only one street with any pretensions to regularity. The straggling town is built on the low flat promontory formed by the *Bojana*, which takes off the waters of the lake to the Adriatic, and the river which flows into the lake after crossing the plain between Scutari and the mountains of *Biskassi*. In winter the town is often flooded by the *Bojana*. The mosques and minarets are insignificant; the handsomest of the churches is the Catholic church at the north-east end. In the background is an old Venetian fortress perched on a lofty rock. The town is favourably situated for commerce, being connected by the *Bojana* with the Adriatic, whence its boats carry the products which descend by the *Drina* to the mountaineers in exchange for their wool, grain, and dyeing and building woods. There are some manufactures of arms and of cotton stuffs. In 1884 330 ships of 123,923 tons entered the port and 325 ships of 123,713 tons cleared.

Livy relates that *Scodra* was chosen as capital by the Illyrian king *Gentius*, who was here besieged in 168 B.C., and carried captive to Rome. In the 7th century Scutari fell into the hands of the Servians, from whom it was wrested by the Venetians, and finally, in 1479, the Turks acquired it by treaty. Early in 1885 a beginning was made with the construction of a highway from the roadstead of *San Giovanni de' Medici* to Scutari.

SCYLAX of Caryanda in Caria was employed by Darius I. to explore the course of the Indus. He started from Afghanistan and is said by Herodotus (iv. 44) to have reached the sea and then sailed to the Gulf of Suez (comp. *PERSIA*, vol. xviii. p. 569). Scylax wrote an account of his explorations, which is referred to by Aristotle and other ancient writers, but must have been lost pretty early, and probably also a history of the Carian hero *Heraclides*, who distinguished himself in the revolt against Darius.² But *Suidas*, who mentions the second work, confounds the old Scylax with a much later author, who wrote a refutation of the history of Polybius, and is presumably identical with Scylax of Halicarnassus, a statesman and astrologer, the friend of *Panætius* spoken of by Cicero (*De Div.*, ii. 42). Neither of these, however, can be the author of the *Periplus* of the Mediterranean, which has come down to us under the name of Scylax of Caryanda in several MSS., of which the archetype is at Paris. This work is little more than a sailor's handbook of places and distances all round the coast of the Mediterranean and its branches, and then along the outer Libyan coast as far as the Carthaginians traded; but various notices of towns and the states to which they belong enable us to fix the date with considerable precision. Niebuhr gave the date 352-348 B.C., others bring it down a year or two later, and C. Müller as late as 338-335, which is only possible if the writer's information was sometimes rather stale. See the discussion in Müller's edition (*Geog. Gr. Min.*, vol. i., Paris, 1855), and against him Unger, in *Philologus*, 1874, p. 29 sq., who con-

¹ The cemetery is intersected with numerous paved alleys, and the tombstones are inscribed with verses of the Koran gilded on a dark blue ground and bearing each simply the name of the deceased. The monuments of the men are distinguished each by a turban, those of the women each by a lotus leaf. The nature of the carved turban indicates the rank of the deceased and the fashion of the time to which it refers, so that the tombstones present the sculptured history of the Mohammedan head-dress from the date of the Turkish conquest. Each corpse is allowed a separate grave, never desecrated either by axe or spade. This cemetery lying in Asiatic ground is on that account the more desired as a burial-place by pious Mahomedans, and holds half the generations of Stamboul (probably some 3,000,000 persons).

² See A. v. Gutschmidt, in *Rhein. Mus.*, 1854, p. 141 sq.

cludes for the year 347. The latest edition is that of Fabricius (Leipsic, 1878).

SCYLLA AND CHARYBDIS. In Homer (*Od.*, xii. 73 sq.) Scylla is a dreadful sea-monster, daughter of Crataeis, with six heads, twelve feet, and a voice like the yelp of a puppy. She dwelt in a sea-cave looking to the west, far up the face of a huge cliff. Out of her cave she stuck her heads, fishing for marine creatures and snatching the seamen out of passing ships. Within a bowshot of this cliff was another lower cliff with a great fig-tree growing on it. Under this second rock dwelt Charybdis, who thrice a day sucked in and thrice spouted out the sea water. Between these rocks Ulysses sailed, and Scylla snatched six men out of his ship. In later classical times Scylla and Charybdis were localized in the Strait of Messina,—Scylla on the Italian, Charybdis on the Sicilian side. In Ovid (*Metam.*, xiv. 1-74) Scylla appears as a beautiful maiden beloved by the sea-god Glaucus and changed by the jealous Circe into a sea-monster; afterwards she was transformed into a rock shunned by seamen. There are various other versions of her story. According to a late legend (Servius on Virgil, *Æn.*, iii. 420), Charybdis was a voracious woman who robbed Hercules of his cattle and was therefore cast into the sea by Jupiter, where she retained her old voracious nature. The well-known line

"Incidis in Scyllam cupiens vitare Charybdim"

occurs in the *Alexandreis* of Philip Gualtier (a poet of the 13th century), which was printed at Lyons in 1558.

Another Scylla, confounded by Virgil (*Ec.*, vi. 74 sq.) with the sea-monster, was a daughter of Nisus, king of Megara. When Megara was besieged by Minos, Scylla, who was in love with him, cut off her father's purple lock, on which his life depended. But Minos drowned the undutiful daughter (*Æschylus, Choeph.*, 613 sq.; Apollodorus, iii. 15, 8).

SCYMNUS of Chios, a Greek geographer of uncertain date, known to us only by a few references in later writers, but perhaps identical with the Scymnus Chius of a Delphic inscription of the beginning of the 2d century B.C.,¹ was commonly taken to be the author of an imperfect anonymous *Paraphrasis* in verse describing the northern coast of the Mediterranean, which in the first edition (Augsburg, 1600) was ascribed to Marcianus of Heraclea. Meineke showed conclusively that this piece cannot be by Scymnus. It is dedicated to a King Nicomedes, probably Nicomedes III. of Bithynia, and so would date from the beginning of the 1st century B.C. See Müller, *Geog.-Gr. Min.*, vol. i., where the poem is edited with sufficient prolegomena.

SCYROS, a small rocky barren island in the Ægean Sea, off the coast of Thessaly, containing a town of the same name. In 469 B.C. it was conquered by the Athenians under Cimon, and it was probably about this time that the legends arose which connect it with the Attic hero Theseus, who was said to have been treacherously slain and buried there. A mythic claim was thus formed to justify the Athenian attack, and Cimon brought back the bones of Theseus to Athens in triumph. The inhabitants of Scyros before the Athenian conquest were Dolopes (Thuc., i. 98); but other accounts speak of Pelasgians or Carians as the earliest inhabitants. There was a sanctuary of Achilles on the island, and numerous traditions connect Scyros with that hero. He was concealed, disguised as a woman, in the palace of Lycomedes, king of the island, when his mother wished to keep him back from the Trojan War; he was discovered there by Odysseus, and gladly accompanied him to Troy. An entirely different cycle of legends relate the conquest of Scyros by Achilles. The actual worship on the island of a hero or god named

Achilles, and the probable kinship of its inhabitants with a Thessalian people, whose hero Achilles also was, form the historical foundation of the legends. Scyros was left, along with Lemnos and Imbros, to the Athenians by the peace of Antalcidas (387 B.C.). It was taken by Philip, and continued under Macedonian rule till 196, when the Romans restored it to Athens, in whose possession it remained throughout the Roman period. It was sacked by an army of Goths, Heruli, and Peucini, in 269 A.D. The ancient city was situated on a lofty rocky peak, on the north-eastern coast, where the modern town of St George now stands. A temple of Athena, the chief goddess of Scyros, was on the shore near the town. The island has a small stream, called in ancient times Cephissus. Strabo mentions as its sole products its excellent goats and a species of variegated marble—the latter in great favour at Rome.

SCYTHE AND SICKLE. Till the invention of the reaping machine, which came into practical use only about the middle of the 19th century, scythes and sickles were the sole reaping implements. The scythe is worked with two hands with a swinging motion, while the sickle or reaping hook is held in one hand and the reaper bends and cuts the crop with a shearing or hitting motion. Of the two the sickle is the more ancient, and indeed there is some reason to conclude that its use is coeval with the cultivation of grain crops. Among the remains of the later Stone period in Great Britain and on the European continent curved flint knives have occasionally been found the form of which has led to the suggestion that they were used as sickles. Sickles of bronze occur quite commonly among remains of the early inhabitants of Europe. Some of these are deeply curved hooks, flat on the under-side, and with a strengthening ridge or back on the upper surface, while others are small curved knives, in form like the ordinary hedge-bill. Among the ancient Egyptians toothed or serrated sickles of both bronze and iron were used. Ancient Roman drawings show that both the scythe and the sickle were known to that people, and Pliny makes the distinction plain.² Although both implements have lost much of their importance since the general introduction of mowing and reaping machinery, they are still used very extensively, especially in those countries where small agricultural holdings prevail. The principal modern forms are the toothed hook, the scythe hook, the Hainault scythe, and the common scythe. The toothed hook, which was in general use till towards the middle of the 19th century, consists of a narrow-bladed curved hook, having on its cutting edge a series of fine close-set serratures cut like file-teeth; with their edges inclined towards the heft or handle. Such sickles were formerly made of iron edged with steel; but in recent times they came to be made of cast steel entirely. Towards the middle of the century the toothed hook was gradually supplanted by the scythe hook or smooth-edged sickle, a somewhat heavier and broader-bladed implement, having an ordinary knife edge. Both these implements were intended for "shearing" handful by handful, the crop being held in the left hand and cut with the tool held in the right. A heavy smooth-edged sickle is used for "bagging" or "clouting,"—an operation in which the hook is struck against the straw, the left hand being used to gather and carry along the cut swath. The Hainault scythe is an implement intermediate between the scythe and

¹ See Rhode, in *Rhein. Mus.*, 1879, p. 153 sq.

² "Of the sickle there are two varieties, the Italian, which is the shorter and can be handled among brushwood, and the two-handed Gallic sickle, which makes quicker work of it when employed on their [the Gauls'] extensive domains; for there they cut their grass only in the middle, and pass over the shorter blades. The Italian mowers cut with the right hand only" (*H. N.*, xviii. 67).

the sickle, being worked with one hand, and the motion is entirely a swinging or bagging one. The implement consists of a short scythe blade mounted on a vertical handle, and in using it the reaper collects the grain with a crook, which holds the straw together till it receives the cutting stroke of the instrument. The Hainault scythe is extensively used in Belgium. The common hay scythe consists of a slightly curved broad blade varying in length from 28 to 46 inches, mounted on a bent, or sometimes straight, wooden sned or snathe, to which two handles are attached at such distances as enable the workman, with an easy stoop, to swing the scythe blade along the ground, the cutting edge being slightly elevated to keep it clear of the inequalities of the surface. The grain-reaping scythe is similar, but provided with a cradle or short gathering rake attached to the heel and following the direction of the blade for about 12 inches. The object of this attachment is to gather the stalks as they are cut and lay them in regular swaths against the line of still-standing corn. The reaping scythe, instead of a long sned, has frequently two helves, the right hand branching from the left or main helve and the two handles placed about 2 feet apart. The best scythe blades are made from rolled sheets of steel, riveted to a back frame of iron, which gives strength and rigidity to the blade. On the Continent it is still common to mould and hammer the whole blade out of a single piece of steel, but such scythes are difficult to keep keen of edge. There is a great demand for scythes in Russia, chiefly supplied from the German empire and Austria. The principal manufacturing centre of scythes and sickles in the United Kingdom is Sheffield.

SCYTHIA, SCYTHIANS. When the Greeks began to settle the north coast of the Black Sea, about the middle of the 7th century B.C., they found the south Russian steppe in the hands of a nomadic race, whom they called Scythians. An exacter form of the name was Scoloti. The inhabitants of the steppe must always have been nomads; but the life of all nomads is so much alike that we cannot tell whether the Scythians are the race alluded to in *Il.*, xiii. 5 sq.

The name is first found in Hesiod (*Strabo*, vii. p. 300) about 800 B.C., and about 689 (*Herod.*, iv. 15) Aristæas of Proconnesus knew a good deal about them in connexion with the ancient trade route leading from their country to Central Asia. From the passage of the Tanais (Don) for fifteen marches north-east through the steppe the country belonged to the nomad Sarmatians, whose speech and way of life resembled those of the Scythians. Then came the wooded region of the Budini, who spread far inland and were probably a Finnish race of hunters with filthy habits.¹ In this region lay Gelonus, the Greek emporium of the fur trade, round which lived the half-Grecian Geloni, probably on the Volga and hardly farther south than Simbirsk. Seven more marches in the same line ran through desert, and then in the country of the Thyssagetæ the road turned south-east, and led first through the country of the Iyrææ, whose way of hunting (*Herod.*, iv. 22) indicates that they dwelt between the steppe and the forest, but belonged more to the former; the road perhaps crossed the river Ural near Orenburg, and ascending its tributary the Ilek crossed the Mugojar Mountains. Beyond this in the steppe as far as the Sir-Darya and Amu-Darya the traveller was again among Scythians, who were regarded as a branch of the European Scythians. Next came a long tract of rocky soil, till the bald-headed Argippæi were reached, a race esteemed holy and seemingly Mongolian, who dwelt on the slopes of impassable mountains, probably the Belur-tagh,

and served as intermediaries in trade with the remoter peoples of Central Asia. The description of the fruit on which they subsisted (*Herod.*, iv. 23) suits the *Elæagnus hortensis*, indigenous on the upper Zerafshan. Many notices of ancient writers about Scythia (e.g., as to the eight months winter and the rainy summer) suit only the lands on the first part of this trade road; moreover, the Greeks soon began to extend the name of Scythians to all the nations beyond in a northerly or north-easterly direction. But such inaccuracy is not common till the fall of the Scythian race, when their name became a favourite designation of more remote and less known nations. Our best and chief informants, Herodotus and Hippocrates, clearly distinguish the Scolots or true Scythians from all their neighbours, and on them alone this article is based.

The boundaries of Scythia are, broadly speaking, those of the steppe, which had as wide a range in antiquity as at the present day, cultivable land having always been confined to the immediate neighbourhood of the rivers. But to the west the Scythians went beyond the steppe, and held Great Wallachia between the Aluta and the Danube (Atlas and Ister). Here their northern neighbours were the Agathyrsians of Transylvania, who were perhaps Aryans, though in manners they resembled the Thracians. The Dniester was Scythian as far up the stream as the Greeks knew it. On the Bug were found first the mixed Græco-Scythian Callipidæ and Alazones as far as Exampæus (an eastern feeder of the Bug), then agricultural Scythians (*Ἀπορῆες*), who grew corn for export, and therefore were not confined to the steppe. This points to south-east Podolia as their dwelling-place. Beyond them on the upper Bug and above the Dniester were the Neuri, who passed for were-wolves, a superstition still current in Volhynia and about Kieff. On the left bank of the Dnieper the "forest-land" (*Ὑλαία*) reached as far as the modern Bereslaff; then came the Scythians of the Dnieper (the Borysthenians), who tilled the soil (of course only close to the river), and extended inland to the Panticapæes (Inguletz?)² and up the stream to the district of Gerrhi (near Alexandrovsk). Herodotus does not know the falls of the Dnieper; beyond Gerrhi he places a desert which seems to occupy the rest of the steppe. Still farther north were the wandering Androphagi (Cannibals), presumably hunters and of Mordvinian race.³ The nomadic Scythians proper succeeded their agricultural brethren to the east as far as the Gerrhus (Konskaya), and their land was watered by the Hypacyris (Molotchnaya).⁴ The royal horde was east of the Gerrhus and extended into the Crimea as far as the fosse which cut off Chersonesus Trachea from the rest of the peninsula, and remains of which can still be traced east of Theodosia. The southern neighbours of the royal Scythians were the savage Taurian mountaineers. Along the coast of the Sea of Azoff the royal horde stretched eastward as far as Cremni (Taganrog); farther inland their eastern border was the Don. They extended inland for twenty marches, as far probably as the steppe itself, and here their neighbours were the Melanchlæni (Black-cloaks).

The true Scythians led the usual life of nomads, moving

² Herodotus (iv. 54) makes it an eastern instead of a western feeder of the Dnieper.

³ The eastern Mordvinians (*Érsians*) still passed for cannibals in the time of the Arabian travellers.

⁴ Herodotus (iv. 56) represents the Gerrhus as a branch of the Dnieper flowing into the Hypacyris, which is not impossible (*Von Baer, Histor. Fr.*, p. 66). But Herodotus himself never travelled beyond Olbia, and what he there learned about the rivers was necessarily vague, except for the parts which the Eastern trade route from Olbia touched. He filled up this imperfect information on analogy, supposing that all these rivers came from lakes, as the Bug did, with which he knew a lake was connected called "mother" of that river (iv. 51, 52, 54, 55, 57).

¹ In *Herod.*, iv. 109, *φθειροτραγέουσι* is to be taken literally. *Plan de Carpin* relates the same thing of the Mongols.

through the steppe from exhausted to fresh pastures, their women in waggons roofed with felt and drawn by oxen, the men on horseback, the droves of sheep, cattle, and horses following. They lived on boiled flesh, mare's milk, and cheese; they never washed, but enjoyed a narcotic intoxication in combination with a vapour bath by shutting themselves up within curtains of felt and strewing hemp seed on heated stones. The women, in place of washing, daubed themselves with a paste containing dust of fragrant woods and removed it on the second day. Like many other barbarians, the Scythians, at least in Hippocrates's time (ed. Littré, ii. 72), were not a specially hardy race; they had stout, fleshy, flabby bodies, the joints concealed by fat, their countenances somewhat ruddy. The observation of Hippocrates that they all looked alike is one that has often been made by travellers among lower races. They were liable to dysentery and rheumatism, which they treated by the actual cautery; impotence and sterility were common, and, though the accounts vary, it is probable that the race was not very numerous (Herod., iv. 81).

Hippocrates's description has led many writers to view the Scythians as Mongolian; but the life of the steppe impresses a certain common stamp on all its nomad inhabitants, and the features described are not sufficiently characteristic to justify the assumption of so distant a Mongol migration. What remains of the Scythian language, on the other hand, furnished Zeuss with clear proofs that they were Aryans and nearly akin to the settled Iranians. The most decisive evidence is found in Herodotus (iv. 117), viz., that Scythians and SARMATIANS (*q.v.*) were of cognate speech; for the latter were certainly Aryans, as even the ancients observed, supposing them to be a Median colony (Diod., ii. 43; Pliny, vi. 19). The whole steppe lands from the Oxus and the Jaxartes to the Hungarian puszta seem to have been held at an early date by a chain of Aryan nomad races.

The Scythian deities have also an Aryan complexion. The highest deity was Tabiti, goddess of the hearth; next came the heaven-god Papæus, with his wife the earth-goddess Apia; a sun-god, Œtosyrus; a goddess of fecundity, Arippasa, who is compared with the Queen of Heaven at Ascalon; and two gods to whom Herodotus (iv. 59) gives the Greek names of Heracles and Ares. These deities were common to all Scythians. The royal horde had also a sea-god, Thamimasadas. In true Iranian fashion the gods were adored without images, altars, or temples, save only that Ares had as his symbol a sabre (Herod., iv. 62), which was set up on a huge altar piled up of faggots of brushwood. He received yearly sacrifices of sheep and oxen, as well as every hundredth captive. Ordinarily victims were strangled. Diviners were common, and one species of them, who came only from certain families, the Enarians or Anarians, were held in high honour. These supposed their race to have offended the goddess of heaven, who in revenge smote them with impotence; they assumed the dress and avocations of women and spoke with a woman's voice.¹ Divination was practised with willow withes as among the Old Germans; the Enarians, however, used lime-tree bark. False prophets were tied on a waggon with burning brushwood, and the frightened team was driven forth. Oaths were sealed by drinking of a mixture of wine with the blood of the parties into which they had dipped their weapons. When the king was sick it was thought that some one had sworn falsely by the deities of his hearth,² and the man

was beheaded whom the diviners, or a majority of them, pronounced to be the culprit. When the king commanded the death of a man all his male offspring perished with him (for fear of blood-revenge). He who gained a suit before the king had the right to make a drinking-cup of his adversary's skull. Actions at law thus stood on the same footing with war, for this is what one did after slaying a foe. The Scythians fought always on horseback with bow and arrow, and the warrior drank the blood of the first man he slew in battle, probably deeming that his adversary's prowess thus passed into him. No one shared in booty who had not brought the king a foeman's head; the scalp was then tanned and hung on the bridle. Captive slaves were blinded on the absurd pretext that this kept them from stealing the mare's-milk butter they were employed to churn.

The government was strictly despotic, as appears most plainly in the hideous customs at the burial of kings. The corpse of an ordinary Scythian was carried about among all the neighbours for forty days, and a funeral feast was given by every friend so visited. But the royal corpse was embalmed and passed in like manner from tribe to tribe, and the people of each tribe joined the procession with their whole bodies disfigured by bloody wounds, till at length the royal tombs at Gerrhi were reached. Then the king was buried along with one of his concubines, his cupbearer, cook, groom, chamberlain, and messenger, all of whom were slain. Horses, too, and golden utensils were buried under the vast barrow that was raised over the grave. Many such tumuli (called in Tatar *kurgan*) have been found between the Dnieper and the sources of the Tokmak, a tributary of the Molotchnaya. Then, on the first anniversary, yet fifty horses and fifty free-born Scythian servants of the king were slain, and the latter were pinned upright on the stuffed horses as watchmen over the dead.

The Scythians deemed themselves autochthonous; their patriarch was Targitaus, a son of the god of heaven by a daughter of the river Dnieper. This legend, with the site of the royal graves, points to the lower Dnieper as the cradle of their kingdom. The further legend (Herod., iv. 5) of the golden plough, yoke, battle-axe, and cup (tokens of sovereignty over husbandmen and warriors) that fell from heaven, and burned when the two eldest sons of Targitaus approached them, but allowed the youngest son to take them and become king, has been well compared by Duncker with the Iranian conception of *hvarēnō*, the halo of majesty, which refused to be grasped by the Turanian Frañraçé, but attached itself to pious kings like Thraétaóna. The eldest brother, Lipoxais, was ancestor of the Auchatæ; the second, Arpoxais, of the Catiari and Trasprians; the youngest, Colaxais (whose name seems to be mutilated), was father of the royal tribe of Paralatæ, and from him, too, the whole nation had the name of Scolots. Pliny (*H.N.*, iv. 88) places the Auchatæ on the upper Bug, so this seems to be the proper name of the agricultural Scythians; if so, the Catiari and Trasprians will be the Borysthenian and nomad Scythians who dwelt between the husbandmen and the royal horde. Colaxais divided his kingdom among his three sons, the chief kingdom being that in which the golden relics were kept; and these three sons correspond to the three kings of the Scythians in the time of Darius's invasion, viz., Scopasis, whose realm bordered on the Sarmatians; Idanthyrsus, sovereign of the chief kingdom; and Taxacis,—the last two being neighbours of the Budini and the Geloni. According to the Scythians, Targitaus lived just a thousand years before the year 513 B.C.,—a legend which, taken with the tradition of autochthonism, indicates a much earlier date for the immigration of the Scythians than we should deduce from other narratives.

¹ Reineggs in 1776 observed the same symptoms, with the same consequence of relegation among the women, in certain Nogai Tatars on the Kuban.

² The plural (Herod., iv. 69) reminds us of the Fravashi of the king in the *Avesta*.

Aristeas of Proconnesus (Herod., iv. 13) had heard of a migration of the Scythians into their later settlement. The one-eyed Arimaspians, who, as neighbours of the gold-guarding griffins, may be sought near the gold-fields of the Tibetan plateau, had attacked the Issedones (whom later authors are probably right in placing in the region of Kashgar and Khotan), and the latter in turn fell on the Scythians and drove them from their seats, whereupon these occupied the lands held till then by the Cimmerians. It is a probable conjecture that the branch of the royal Scythians spoken of as dwelling north of the Oxus and Jaxartes was really a part of the nation that remained in their ancient home. Aristeas's story has much internal probability; but it is impossible to hold that the Scythian migration immediately preceded the first appearance of the expelled Cimmerians in Asia Minor, in Aristeas's own days (695 B.C.). The Scythians must have seized the steppe as far as the Dnieper centuries before, but the older inhabitants, who were probably of one race with the Thracians, remained their neighbours in the Crimea and the extreme west till the beginning of the 7th century.

Concerning the complete expulsion of the Cimmerians and the Scythian invasion of Asia that followed, Herodotus (iv. 11 sq., i. 103-106, iv. 1, 3 sq.) gives an account, taken from several sources, which is intelligible only when we put aside the historian's attempts to combine these. A barbarian (*i.e.*, Median) account was that the Scythian nomads of Asia, pressed by the Massagetæ, crossed the Araxes (by which Herodotus here and in other places means the Amu-Darya) and fell on Media. Taking these Scythians for Scolots and assuming, therefore, that the reference was to their first migration, Herodotus had to place the expulsion of the Cimmerians between the crossing of the Araxes and the invasion of Media, and he had heard from Greeks (of Pontus) that on the Dniester was the grave of the Cimmerian kings, who had slain each other in single combat rather than share the migration of their people. This local tradition implies that the Cimmerians reached Asia Minor through Thrace, which, indeed, is the only possible route, except by sea; Herodotus, however, is led by his false presuppositions to conduct them eastwards from the Dniester by the Crimea (where many local names preserved their memory), and so along the Black Sea coast, and then westwards from the Caucasus to Asia Minor. The Scythians, he thinks, followed them, but, losing the trail, went east from the Caucasus, and so reached Media. This he gives only as his own inference from two things—(1) that the Cimmerians settled on the peninsula of Sinope, from which their forays into Asia Minor seem to have been conducted, and (2) that the Scythians invaded Media. The Median source spoke further of a great victory of the Scythians, after which they overran all Asia, and held it for twenty-eight years (634-606), levying tribute and plundering at will, till at length the Medes, under Cyaxares, destroyed most of them after making them drunk at a banquet.¹ Here a third, Egyptian, account comes in, *viz.*, that King Psammetichus (d. 611) bought off certain northern invaders who had advanced as far as Philistæa; there is no reason to doubt that these are the Scythians of the Median account. Still more important is the evidence of certain prophecies of Jeremiah (comp. iii. 6) in the reign of Josiah (628-609), describing the approach from the north of an all-destroying nation of riders and bowmen (Jer. iv. 6 sq., v. 15 sq., vi. 1 sq., 22 sq.).² Herodotus's twenty-eight years are simply the period between the accession of Cyaxares

and the taking of Nineveh, which followed close on the overthrow of the Scythians; Justin, on the other hand, gives the Scythians eight years of sovereignty, which fits well with the interval between the first and the second siege of Nineveh (619-609).³

A fourth account in Herodotus, which connects the *θήλεια νόστος* of the Enarians with the plundering of the temple of Astarte at Ascalon, is entirely apocryphal, and must come from the Greek identification of this Astarte with the Scythian, Arippasa. Yet it seems to have been chiefly this story that led Herodotus to take the Scythians of his Median source for Scolots. He is refuted by another account of Iranian origin: Ctesias (in Diod., ii. 34) tells of a long war between the Medes and the Sacæ, occasioned by the defection of Parthian subjects of Media to the latter nation in the time of Astibaras (Cyaxares); so that the Scythian conquerors actually came from the east, not from the north. Herodotus's Median source closed with Cyaxares recovering his power; the story which follows about the resistance of the slaves of the Scythians to their returning lords, who cowed them by using whips instead of arms, must have come from the Pontic Greeks, and is certainly a local legend,⁴ which has nothing to do with the wars in Asia, and indeed is connected by Callistratus (Steph. Byz.; *s.v.* *Τάφραι*) with a war between Scythians and Thracians.

From the expedition of Darius upwards Herodotus names five generations of Scythian kings, Idanthyrus, Saulius, Gnurur, Lycus, Spargapeithes; the last may be contemporary with the foundation of Olbia (646 B.C.).⁵ Under Idanthyrus fell the invasion of Darius (513 B.C.). The motive for this invasion cannot possibly have been revenge for the Scythian invasion of Media. It is possible that a popular war against the chief nation of the nomads, who are so hated by the Iranian peasants, seemed to Darius a good way of stimulating common feeling among his scattered subjects, and it is certain that he had quite false ideas of the wealth of Scythia, due perhaps to export of grain from the Grecian cities of the Scythian coast. Herodotus's account of the campaign is made up in a puzzling way of several distinct narratives, retouched to smooth away contradictions. Here it must suffice to refer to the article PERSIA (vol. xviii. p. 570), and to add that the geographical confusion in Herodotus and his exaggerated idea of the distance to which the Persians advanced seem to be due partly to a false combination between a Scythian account of the campaign and certain notices about the burning of Gelonus by enemies and about fortresses on the river Oarus which had come to him from the inland trade route, and had nothing to do with Darius, partly to a confusion between the desert reached by the Persians and that which lay between the Budini and Thyssagetæ.

While the Persian rule in the newly conquered districts of Europe was shaken by the Ionic revolt, the Scythians made plundering expeditions in Thrace, and in 495 penetrated into the Chersonesus, whose tyrant Miltiades fled, but was restored after their retreat by the Dolonci (Herod., vi. 40). Darius had Abydus and the other cities of the Propontis burned lest they should furnish a base for a projected Scythian expedition against Asia (Strabo, xiii. p. 591); this agrees with the fact known from Herodotus (v. 117),

³ Eusebius's date (634) for the Scythians in Palestine is deduced from Herodotus.

⁴ It is meant to explain the origin of the *fosse* (Herod., iv. 3), which the slaves were said to have dug, and of a subject-race in the same district (Pliny, *H.N.*, iv. 80), the Sindians (Amm. Mar., xxii. 8, 41; Val. Flac., vi. 86), or rather perhaps the Satarchæ.

⁵ That the wise ANACHARSIS (*q.v.*) was brother of King Saulius (Caduidas of Diog. Laert., i. 101) seems to be a mere guess of Herodotus's Scythian informant Tunes. The story of Anacharsis's fate is coloured by that of the later king Scyles.

¹ This story may be influenced by the myth about the feast of the Sacæ (Strabo, xi. p. 512). Ctesias has it that peace was made.

² This is Hitzig's discovery and must be sound. Before the fall of Nineveh the Chaldeans could not be a source of danger.

that Abydus had been retaken by Daurises a little before. In this connexion the Scythian embassy to King Cleomenes at Sparta (Herod., vi. 84) to arrange a combined attack on Asia becomes credible; for, barbarians though they were, the Scythians had a political organization and many connexions with the Ionians of the Pontic colonies, so that their envoys may well have reached Sparta at the same time with Aristagoras (499) and served as decoys for his fantastic schemes.¹

Our accounts of the Scythians begin to fail after the time of King Scyles, who affected Grecian habits and was deposed and finally slain for sharing in Bacchic orgies (Herod., iv. 78-80); his death fell a little before Herodotus's visit to Olbia (c. 456). We read in an unclear context (Diod., ii. 43) of a division of the Scythians into two great tribes, the Pali and the Napæ, the former of whom crossed the Don from the east and destroyed the latter and also the Tanaites.² These events seem to point to a change of dynasty in the royal horde.

The *Periplus* ascribed to Scylax (346 B.C.) knows the Scythians as still occupying almost exactly the same limits as in Herodotus's time; only in the east there is a small but significant change: the Sarmatians have already crossed the Don (§ 68). King Ateas still ruled Scythia in its old extent (Strabo, vii. 307), but all that we know of the events of his reign took place south of the Danube,—wars with the Triballi in Servia, with Byzantium, with the king of the Greek city of Istrus, and finally with his old ally Philip of Macedon. Philip defeated and slew Ateas near the Danube in 339 B.C. He was then over ninety years old.³

The Scythians appear once more in the region of the Dobrudja in 313, when they helped the citizens of Callatis against Lysimachus and were defeated by him (Diod., xix. 73). All this points to a considerable advance of their frontier southwards, and in fact Pseudo-Scymnus (Ephorus) gives Dionysopolis (a little to the west of the modern Balchik) as the place where the Crobyzian and the Scythian territories met in his time (334 B.C.).⁴ This apparent advance of the realm contrasts singularly with the distress to which Ateas was reduced by the king of the insignificant town of Istrus, an evidence that the Scythian power was really much decayed. Ateas indeed is sometimes painted as a rude barbarian lord of a poor but valiant and hardy race, and Ephorus, who mainly follows Herodotus about Scythia, yet speaks of the Scythians in contrast with the fierce Sarmatians as corresponding to Homer's description of a just and poor people feeding on milk (Strabo, vii. 302). But Aristotle, on the contrary (*Eth. Nic.*, vii. 8), speaks of the effeminacy of the Scythian monarchs as notorious; and indeed there can be little doubt that the Scythians crossed the Danube and settled in the Dobrudja under pressure of the Sarmatians behind them, and that the idyllic picture drawn by Ephorus presupposes the fall of their political system. Diodorus (ii. 43) tells us that the Sarmatians exterminated the inhabitants of most part of Scythia, and this must have taken place in the later years of Ateas, between 346 and 339.

At a later but uncertain date the great inferiority of the Scythians to the Sarmatians is illustrated by the story of Amage, the warlike consort of a debauched Sarmatian king, who with only 120 chosen horsemen delivered Chersonesus

in Tauris from the neighbouring Scythian king, slew him with all his followers, and gave the kingdom to his son (Polyæn., viii. 56). It is, however, not quite certain whether these were a remnant of the old Scythians; and it is still more doubtful whether the powerful Scythian kingdom of Scilurus, who brought the Greek cities of the Crimea to the verge of ruin, but was destroyed by Mithradates Eupator (105), was really a kingdom of Scolots. The last certain trace of true Scythians occurs about 100 B.C. in the Olbian *psephisma* in honour of Protogenes.⁵ Here they appear as a small nation west of Olbia between the Thissamatæ and Saudaratæ, who are anxious to take refuge in Olbia from the (Scordiscian) Galatians.

Sources.—Herodotus (iv. 1-82, 97-142) and Hippocrates (*De Aere*, &c., c. 17-22, in Littre's ed., ii. 66-82) are alone trustworthy, because they carefully distinguish the Scythians from the other northern nations. Ephorus (in Strabo, vii. p. 302 sq., and Scymn., *Perieg.*, 773-878), Diodorus (ii. 43 sq.), and Troguus (in Justin, ii. 1-3, 5, 1-11, and Jordan., *Get.*, v.-vi., x.) do not do so, and must be used with great caution.

Helps.—Ukert, *Geog. d. Gr. und Römer*, iii. 2 (complete collection of materials from original sources); Niebuhr, *Kleine Schriften*, vol. i. (1828); Zeuss, *Die Deutschen und die Nachbarstämme* (1837)—an admirable discussion, which established the Aryan origin of the Scythians; Boeckh, in *C. Insc. Gr.*, ii. 81 sq.; K. Neumann, *Helmen im Skythenlande* (1855)—the best book, in spite of certain fundamental errors, such as the ideas that great part of the steppe was once wooded and that the Scythians were Mongols; Müllenhoff, "Origin and Speech of the Pontic Scythians and Sarmatians," in *Monatsh. d. Berl. Ak.* (1866). The best account of the trade route which in the 5th century B.C. passed through a great part of what is now Russian territory is by K. E. v. Baer, *Historische Fragen*, &c. (1873); comp. also Grote, *Hist. of Greece*, iii. 314 sq. (1850), and Duncker, ii. 430 sq. (5th ed.). There is a class of mere amateurs, especially in east Germany, who absurdly take the Scythians to have been Slavs. (A. v. G.)

SEA. Any part of the ocean marked off from the general mass of water may be called a sea. In geography the name is loosely applied: for instance, the Arabian Sea is an open bay, Hudson's Bay is an enclosed sea. Seas proper lie within the transitional area which divides the permanent continental masses from the permanent ocean basins, and their boundaries are consequently subject to geological change, and to alteration by subsidence and elevation occurring in historic times.

Inland Seas are seas entirely surrounded by land (see CASPIAN SEA, DEAD SEA, and, for general discussion, LAKE).

Enclosed Seas have communication with the ocean restricted to one opening, which may take the form of one, two, or more straits close to each other. The best known are the White Sea of the Arctic Ocean; the Baltic, Zuyder Zee, Hudson's Bay, Gulf of Mexico, and Mediterranean, with the Adriatic and Black Sea, of the Atlantic; the Red Sea and Persian Gulf of the Indian Ocean; and the Yellow Sea and Sea of Okhotsk of the Pacific.⁶ They are all cut off from general oceanic circulation and very largely from tides, but the result is not stagnation. The Baltic and Black Sea are but slightly saline on account of the number of large rivers falling into them, and the fresh surface-water flows out as a regular current, liable indeed to be checked, and even reversed for a time, but in the main persistent; while the salt water flows in uniformly as an undercurrent. A state of equilibrium is arrived at, so that periodical fluctuations of salinity do not affect the average of a number of years. The water of the Mediterranean and Red Sea is much saltier than that of the ocean, which therefore flows in as a surface-current, while the dense very salt water escapes below. In the case of the Baltic and Black Sea dilution by rivers, in that of the Mediterranean and Red Sea concentration by evaporation maintains a circu-

¹ King Ariantas, whose primitive census is mentioned in Herodotus (iv. 81), seems to have flourished at this time.

⁶ The prevalence of colour names for these seas is noteworthy.

lation. Winds and differences of barometric pressure are, as in inland seas, great factors in producing variable currents. (See **BALTIC SEA**, **BLACK SEA**, **MEDITERRANEAN SEA**, **RED SEA**, &c.)

Partially Enclosed Seas may be (a) comparatively shallow irregular channels through which strong tides sweep, or (b) ocean basins cut off by barriers barely rising to the surface, or remaining permanently submerged, in which case there may be no break of continuity in the ocean surface to indicate the sea. Seas of the first description are related to shallow enclosed seas, but are much affected by tides and ocean currents; the principal are the Kara Sea of the Arctic Ocean, Baffin Bay and North Sea of the Atlantic, Behring Sea and Japan Sea of the Pacific. They are subject to considerable temperature changes owing to their proximity to land. Seas coming under the second category combine the peculiarities of the open ocean and of deep inland seas. The Caribbean Sea of the Atlantic, the China Sea, Java Sea, and numerous small seas of the eastern archipelago of the Pacific are the best examples. Their chief peculiarity is that the temperature of the water instead of falling uniformly to the bottom becomes stationary at some intermediate position corresponding to the top of the barrier. They are usually very deep. (See **NORTH SEA**, **NORWEGIAN SEA**, and **PACIFIC OCEAN**.)

Other Seas.—Coral Sea, Arabian Sea, Sea of Bengal, are names, now dropping out of use, to designate parts of the ocean. "Sargasso Sea" is an expression devoid of geographical meaning (see **ATLANTIC OCEAN**, vol. iii. p. 20).

Firths and Estuaries.—A river entering the sea by a short estuary flows over the surface, freshening it to a considerable extent, and, if the force of its current is not too great, the rising tide slowly forces a wedge of sea water up between river and river bed, withdrawing it rapidly when ebb sets in. In a firth that is large compared with the river falling into it, judging from results recently obtained in the Firth of Forth,¹ a state of equilibrium is arrived at, the water increasing in salinity more and more gradually as it proceeds seawards, the disturbing influence of the tide becoming less and less, and the vertical distribution of salinity more and more uniform until the river water meets the sea, diffused through a nearly homogeneous mass with a density little inferior to that of the ocean. Between the extreme cases there are numerous gradations of estuary depending on the ratio of river to sea inlet.

Deposits.—All seas within about 300 miles of continental land, whatever may be their depth, are paved with terrigenous débris, and all at a greater distance from shore are carpeted with true pelagic deposits (see **PACIFIC OCEAN**).

Marine Fauna and Flora.—The mixing of river with sea water produces a marked difference in the fauna and flora of seas. Where low salinity prevails diatoms abound, probably on account of the greater amount of silica dissolved in river water, and they form food for minute pelagic animals and larvæ, which are in turn preyed upon by larger creatures. In some seas, such as the North Sea, there are many celebrated fishing beds on the shallow banks of which innumerable invertebrate animals live and form an inexhaustible food-supply for edible fishes. Naturalists have remarked that in temperate seas enormous shoals of relatively few species are met with, while in tropical seas species are very numerous and individuals comparatively few. Organisms, such as the corals, which secrete carbonate of lime appear to flourish more luxuriantly in warmer and saltier seas than in those which are colder and fresher.

The geological and dynamic aspects of seas are treated of in **GEOLOGY** (vol. x. p. 284 *sq.*) and **GEOGRAPHY (PHYSICAL)**; and in **ATLANTIC OCEAN**, **BALTIC SEA**, **BLACK SEA**, **INDIAN**

OCEAN, **MEDITERRANEAN SEA**, **NORTH SEA**, **NORWEGIAN SEA**, **PACIFIC OCEAN**, **POLAR REGIONS**, and **RED SEA** the general geographical and physical characters of oceans and seas are described. In **METEOROLOGY** some account is given of the influence of the sea on climate, and chemical problems connected with the ocean are discussed in **SEA WATER**.

SEA-CAT. See **SEA-WOLF**, *infra*.

SEA-DEVIL. See **FISHING-FROG**, vol. ix. p. 269.

SEA-HORSE. Sea-horses (*Hippocampina*) are small marine fishes which, together with pipe-fishes (*Syngnathina*), form the order of Lophobranchiate fishes, as already noticed in **ICHTHYOLOGY**, vol. xii. p. 694. The gills of the members of this order are not arranged in leaf-like series as in other fishes, but form a convex mass composed of small rounded lobes attached to the branchial arches, as shown in the accompanying figure (fig. 1) of the head of a sea-horse, in which the gill-cover has been pushed aside to show the interior of the gill-cavity. Sea-

FIG. 1.—Gills of *Hippocampus abdominalis*.

horses differ from pipe-fishes by having a prehensile and invariably finless tail; it is long, slender, tapering, quadrangular in a transverse section, and, like the rest of the body, encased in a dermal skeleton, which consists of horny segments, allowing of ventral, and in a less degree of lateral, but not of dorsal, flexion. The typical sea-horse (*Hippocampus*) can coil up a great portion of its tail, and firmly attach itself by it to the stems of sea-weeds or other similar objects. The body is compressed and more or less elevated, and the head terminates in a long tubiform snout, at the end of which the small mouth is situated. The whole configuration of the fore part of the body, as well as the peculiar manner in which the head is joined to the neck-like part of the trunk, bears a striking resemblance to a horse's head; hence the name by which these fishes are generally known. Sea-horses are bad swimmers and are unable to resist currents. With the aid of their

FIG. 2.—*Phyllopteryx eques*.

single dorsal fin, which is placed about the middle of the fish's body and can be put into a rapid undulatory motion, they shift from time to time to some other object near them, remaining stationary among vegetation or coral where they find the requisite amount of food and sufficient

¹ Mill, *Proc. Roy. Soc. Ed.*, xiii. 29, 137, and 347.

cover. Their coloration and the tubercles or spines on the head and body, sometimes with the addition of skinny flaps and filaments, closely resemble their surroundings, and constitute the means by which these defenceless creatures escape detection by their enemies. These protective structures are most developed in the Australian genus *Phyllopteryx*, one of the most singular types of littoral fishes.

Sea-horses belong to the tropics and do not extend so far north as pipe-fishes. They are abundant at suitable localities, chiefly on the coral-banks of the Indo-Pacific Ocean. Some thirty species are known, of which the majority belong to the genus *Hippocampus* proper. Their size varies from 2 to 12 inches in length; but in China and Australia a genus (*Solenognathus*) occurs the species of which attain to a length of nearly 2 feet; they, however, in form resemble pipe-fishes rather than sea-horses. The species which may be sometimes seen in aquaria in Great Britain is *Hippocampus antiquorum*, from the Mediterranean and the coasts of Portugal and France. The food of the sea-horses consists probably of very small invertebrates and the fry of other fishes. Like the other Lophobranchiates, they take great care of their progeny. The male *Hippocampus* carries the ova in a sac on the lower side of the tail, in which they are hatched; in the other genera no closed pouch is developed, and the ova are embedded in the soft and thickened integument of either the abdomen or the tail.

SEAL. In the article MAMMALIA (vol. xv. p. 442) will be found a general account of the distinguishing characteristics of the animals constituting the sub-order *Pinnipedia* of the order *Carnivora*, and their divisions into families and genera. It only remains to give some further details respecting those members of the group to which the term "seal" is properly restricted (the sub-family *Phocinæ*), especially those which inhabit the British coasts.

Although seals swim and dive with the greatest ease, often remaining as much as a quarter of an hour or more below the surface, and are dependent for their sustenance entirely on living prey captured in the water, all the species frequently resort to sandy beaches, rocks, or ice-floes, either to sleep or to bask in the sun, and especially for the purpose of bringing forth their young. The latter appears to be the universal habit, and, strange as it may seem, the young seals—of some species at least—take to the water at first very reluctantly, and have actually to be taught to swim by their parents. The number of young produced is usually one annually, though occasionally two. They are at first covered with a coat of very thick, soft, nearly white fur, and until it falls off they do not usually enter the water. This occurs in the Greenland and grey seal when from two to three weeks old, but in the common seal apparently much earlier. One of this species born in the London Zoological Gardens had shed its infantile woolly coat and was swimming and diving about in its pond within three hours after its birth. The movements of the true seals upon the ground or ice are very different from those of the *Otarix* or eared seals, which walk and run upon all four feet, the body being raised as in the case of ordinary quadrupeds. The hinder limbs (by which mainly they propel themselves through the water) are on land always perfectly passive, stretched backwards, with the soles of the feet applied to each other, and often raised to avoid contact with the ground. Sometimes the fore limbs are equally passive, being placed close to the sides of the body, and motion is then effected by a shuffling or wriggling action produced by the muscles of the trunk. When, however, there is any necessity for a more rapid mode of progression, the animals use the fore paws, either alternately or simultaneously, pressing the palmar surface on the ground and lifting and dragging the body forwards

in a succession of short jumps. In this way they manage to move so fast that a man has to step out beyond a walk to keep up with them; but such rapid action costs considerable effort, and they very soon become heated and exhausted. These various modes of progression appear to be common to all species as far as has been observed.

Most kinds of seals are gregarious and congregate, especially at the breeding season, in immense herds. Such is the habit of the Greenland seal (*Phoca groenlandica*), which resorts in the spring to the ice-floes of the North Sea, around Jan Mayen Island, where about 200,000 are killed annually by the crews of the Scotch, Dutch, and Norwegian sealing vessels. Others, like the common seal of the British islands (*Phoca vitulina*), though having a

FIG. 1.—Common seal (*Phoca vitulina*).

wide geographical range, are never met with in such large numbers or far away from land. This species is stationary all the year round, but some have a regular season of migration, moving south in winter and north in summer. They are usually harmless, timid, inoffensive animals, though, being polygamous, the old males often fight desperately with each other, their skins being frequently found covered with wounds and scars. They are greatly attached to their young, and remarkably docile and easily trained when in captivity; indeed, although there would seem little in the structure or habits of the seal to fit it by nature to be a companion of man, there is perhaps no wild animal which attaches itself so readily to the person who takes care of and feeds it. They appear to have much curiosity, and it is a very old and apparently well-attested observation that they are strongly attracted by musical sounds. Their sense of smell is very acute, and their voice varies from a harsh bark or grunt to a plaintive bleat. Seals feed chiefly on fish, of which they consume enormous quantities; some, however, subsist largely on crustaceans, especially species of *Gammarus*, which swarm in the northern seas, also on molluscs, echinoderms, and even occasionally sea-birds, which they seize when swimming or floating on the water.

Although the true seals do not possess the beautiful under-fur ("seal-skin" of the furriers) which makes the skin of the sea-bears or *Otarix* so precious, their hides are still sufficiently valuable as articles of commerce, together with the oil yielded by their fat, to subject them to a devastating persecution, by which their numbers are being continually diminished (see below, p. 581 sq.).

Two species of seals only are met with regularly on the British coasts, the common seal and the grey seal. The

common seal (*Phoca vitulina*) is a constant resident in all suitable localities round the Scottish, Irish, and English coasts, from which it has not been driven away by the molestations of man. Although, naturally, the most secluded and out-of-the-way spots are selected as their habitual dwelling-places, there are few localities where they

FIG. 2.—Skull of common seal, showing form of teeth.

may not be occasionally met with. Within the writer's knowledge, one was seen not many years ago lying on the shingly beach at so populous a place as Brighton, and another was lately caught in the river Welland, near Stamford, 30 miles from the sea. They frequent bays, inlets, and estuaries, and are often seen on sandbanks or mud-flats left dry at low tide, and, unlike some of their congeners, are not found on the ice-floes of the open sea, nor, though gregarious, are very large numbers ever seen in one spot. The young are produced at the end of May or beginning of June. They feed chiefly on fish, and the destruction they occasion among salmon is well known to Scottish fishermen. The common seal is widely distributed, being found not only on the European and American coasts bordering the Atlantic Ocean but also in the North Pacific. It is from 4 to 5 feet in length, and variable in colour, though usually yellowish grey, with irregular spots of dark brown or black above and yellowish white beneath. The grey seal (*Halichoerus grypus*) is of considerably larger size, the males attaining when fully adult a length of 8 feet from nose to end of hind feet. The form of the skull and the simple characters of the molar teeth distinguish it generically from the common seal. It is of a yellowish grey colour, lighter beneath, and with dark grey spots or blotches, but, like most other seals, is liable to great variations of colour according to age. The grey seal appears to be restricted to the North Atlantic, having been rarely seen on the American coasts, but not farther south than Nova Scotia; it is chiefly met with on the coasts of Ireland, England, Scotland, Norway and Sweden, including the Baltic and Gulf of Bothnia, and Iceland, though it does not appear to range farther north. It is apparently not migratory, and its favourite breeding places are rocky islands, the young being born in the end of September or beginning of October.

Other species of seals inhabiting the northern seas, of which stragglers have occasionally visited the British coasts, are the small ringed seal or "floe-rat" of the sealers (*Phoca hispida*), the Greenland or harp seal (*Phoca groenlandica*), the hooded or bladder-nosed seal (*Cystophora cristata*), and possibly the Bearded seal (*Phoca barbata*), though of the last there is no certain evidence. The general characters and geographical distribution of the remaining species of the group are indicated in the article MAMMALIA, vol. xv. p. 442. (W. H. F.)

SEAL FISHERIES.

From a commercial point of view seals may be divided into two groups,—hair seals and fur seals. The former are valued for the oil they yield and for their skins, which are converted into leather, and the latter for their skins alone. The fur seals are provided

with a dense soft under-fur like velvet and a quantity of long loose exterior hair, which has to be removed in dressing the hides. Hair seals are either entirely without under-fur or possess it in too small a quantity to render the skins of much commercial value as furs. The two groups correspond to the two divisions of eared seals and earless seals described above (see also vol. xv. pp. 442-443).¹

Harp Seals.—The principal hair seal fisheries are those of Newfoundland and Labrador (area about 200 miles), the Gulf of St Lawrence, Jan Mayen and the adjacent seas, Nova Zembla, the White Sea and Arctic Ocean, the Caspian, and the North and South Pacific. The first-named is by far the most important. To the immense icefields borne past these shores during the spring months great herds of seals resort for the purpose of bringing forth and suckling their young. These are usually produced in the last week of February and increase rapidly in size. When born they weigh about 5 lb; in four weeks the fat beneath the skin has increased to a depth of 3 to 4 inches, and with the adhering skin weighs from 40 to 50 lb. At this age the animals are in the best condition for being taken, as the oil then yielded is of the best quality. They remain on the ice attended by their dams for about six weeks, when they begin to take to the water, and it becomes much more difficult to capture them. When a floe containing young seals is reached, the hunters take to the ice armed with a pole or "gaff" having a hook at one end and shod with iron at the other. A blow on the nose from this quickly despatches the animal; by means of the "scalping-knife" the skin with the fat adhering is then rapidly detached. The fat and skins are rolled into bundles and dragged to the ship. When the ship reaches port the skins are separated from the fat and salted for export to Great Britain, where they are converted into leather. Of late years furriers have succeeded in converting a few of the finer skins into ladies' tippets. The fat was formerly thrown into huge vats, where its own weight and the heat of the sun extracted the oil, but in the improved modern process the fat is ground into minute pieces by machinery and then steamed; the oil, after being exposed for a time in glass-covered tanks to the action of the sun's rays, is barrelled for exportation. The greater part of it goes to England, where it is largely employed both as an illuminant and as a lubricant. It is also used for tanning purposes and in the manufacture of the finer kinds of soap.

From 8000 to 10,000 men embark annually from Newfoundland on this pursuit. The steamers, which are rapidly superseding sailing vessels, are stoutly timbered, sheathed with iron and wood, and provided with iron-plated stems; they carry from 150 to 300 men each, and make two, and sometimes when very successful even three, trips in the season. From 20 to 25 steamships in all are engaged in this industry, 6 of these being from Dundee, Scotland. The Dundee vessels arrive in Newfoundland in February and there ship their crews; at the close of the sealing season they proceed to the northern whale fishery and return home in October. A "close time" for seals is now established by law. Sailing vessels cannot clear for this fishery before 1st March, nor can steamers before 10th March. After the young seals have taken to the water, the steamers in their second trips engage in the pursuit of the old breeding seals till the middle or end of May. These are taken either by shooting them or clubbing them when congregated in herds on the ice. This practice, which is most injurious to the fishery, has of late been partially abandoned, by an agreement among the owners of vessels not to continue operations beyond 30th April. The failures and disappointments of the voyage are numerous, many vessels returning to port with few seals or even with none. The prizes, however, are so enormous that there is no hesitation in embarking capital in the enterprise. It is no uncommon event for a steamer to return two or three weeks after leaving port laden to the gunwale with seals. As many as 42,000 have been brought in by a single steamer, the value at two and a half dollars per seal being \$105,000 (£21,875). The men on board the steamers share one-third of the proceeds of the voyage among them; the remainder goes to the owners who equip and provision the vessels. In sailing vessels the men get one-half the proceeds. The number of seals taken annually ranges from 350,000 to 500,000. In the three years 1877, 1878, and 1881 the average take was 436,413, valued at £213,937. Between 1881 and 1886 the returns fell below this average owing to the heavy ice, which comparatively few vessels succeeded in penetrating. The large number of young seals which escaped during these years will improve the fishery in the future.

In the seas around Newfoundland and Labrador there are four species of seals,—the bay seal, the harp, the hood, and the square flipper. The first of these frequents the mouths of rivers and harbours and is never found on the ice. The harp, so called from a curved line of dark spots on its back making a figure somewhat resembling an ancient harp, is by far the most numerous, and is *par excellence* the seal of commerce. The hoods, which owe their

¹ Some naturalists have proposed the name *Trichophocinae* for the hair seals and *Oulophocinae* for the fur seals, in allusion to the different character of the skin in the two groups.

name to a bag or hood on the nose of the males, which they can inflate at pleasure for protection, are much larger than the harps, but their oil is not of such good quality. But few square flippers are taken; they are large seals from 12 to 16 feet in length, and are believed to be identical with the great Greenland seals. The seals frequenting these seas are migratory. In May, attended by their young, they commence their northerly movements to the Greenland seas, where they spend two or three months, and in September begin their southerly migration, moving along the coast of Labrador, feeding in its firds and bays. One division passes through the Straits of Belle Isle into the Gulf of St Lawrence, the other along the east coast of Newfoundland. By the close of the year they reach the Great Banks, their southern headquarters, and early in February commence their northerly movement to meet the ice on which their young are to be brought forth.

The Newfoundland fishery was of slight importance till the beginning of the 19th century. At first the seals were taken in nets; the next method was shooting them from large boats, which left shore about the middle of April. Afterwards small schooners were employed, and a rapid expansion of the fishery followed. Over 100 of these small vessels used to leave the port of St John's, and as many more the ports of Conception Bay. In 1795 the whole catch of seals was but 5000. In 1805 it reached 81,000; in 1815, 126,000; in 1822, 306,983. The largest catches on record were in 1830, when 558,942 seals were taken; in 1831, 686,836; 1843, 651,370; and in 1844, 685,530. The following table shows the number of seals taken in some recent years:—

Years.	No. of Seals.	Years.	No. of Seals.
1856	361,817	1881	447,903
1861	375,282	1882	200,500
1869	359,821	1883	300,350
1876	500,000	1884	238,587
1880	223,793		

Of late years an increasing number of steamers from St John's have resorted to the Gulf of St Lawrence as well as small sailing vessels from the southern ports of Newfoundland. A few residents of the Magdalen Islands also pursue the seals on the Gulf ice, and the Canadians carry on a seal fishery along the shore by means of nets both in spring and autumn. The nets are made of strong hempen cord, some of them very large and costing with the anchors and gear as much as £1500 each. This fishery is carried on from Blanc Juberlis Bay to Cape Whittle. The number taken averages about 70,000 to 80,000.

Next in importance is the seal fishery carried on between Greenland, Spitzbergen, and the island of Jan Mayen,—between 68° and 74° N. lat. and 8° E. and 17° W. long. In most years, however, the seals are taken mainly in the vicinity of Jan Mayen. The fishery is carried on by the British, Norwegians, Swedes, Danes, and Germans. The number taken by the British vessels about equals that taken by all the others together. The species taken are the same as on the Newfoundland coast, the harp or saddleback and the hood or bladder-nose. The breeding season is about three weeks later than in the case of the Newfoundland seals, the young being brought forth between the 16th and the 22d of March. The method of capture is almost the same as that of the Newfoundland hunters. Steamers are now almost exclusively employed. The only British ports now engaged in the enterprise are Dundee and Peterhead. During the twelve years 1873 to 1885 the number of British vessels taking part in it was from 14 to 21, the number of men varying from 900 to 1200, and the number of seals taken ranging from 35,000 to 75,000. The total number of seals taken by these vessels during the ten years ending 1884 was 452,013. Formerly, from 1500 to 2700 men were employed, and the number of seals taken ranged from 50,000 to 125,000. The decline has been largely caused by the reckless and barbarous way in which the fishery has been conducted, the practice of seal-hunters of all nations having been to reach the seals soon after the young were born, and then to watch for the mothers as they came to suckle them and shoot them without mercy, leaving the young to die in thousands of starvation on the ice. The consequence is that the herds are not now a twentieth part of their former size. Newfoundland hunters, on the other hand, do not disturb the seals till they are grown and about to leave their mothers, the old seals not being killed till a later date. By an international treaty between England and Norway—the two nations most interested—a “close season” has been established in the Jan Mayen fishery. The Dundee and Peterhead steamers are chiefly manned by Shetlanders, who are taken on board at Lerwick. The vessels make the ice from the 15th to the 20th March and commence the chase in the destructive way already described. They follow up the capture of the young seals in April, when they are better worth taking. Then they proceed to separate the skins from the fat. The former are salted on board, and the fat is stowed in tanks. In May the pursuit of the old seals on the ice commences and continues till the 16th, when it is time to proceed to the whale fishery. The oil is not manufactured till the vessels reach home late in the autumn. As the blubber undergoes decay in the tanks, the oil is not so good in quality as that made in Newfoundland from the fresh fat.

The Jan Mayen fishery commenced in 1840. In that year 13 British vessels and 650 men engaged in it, and 17,300 seals were taken. The Norwegians and other nationalities also took part in it. Steamers were introduced in 1858. The following table shows the growth and decline of the fishery:—

Year.	No. of British Vessels.	No. of Men.	Seals taken.	Year.	No. of British Vessels.	No. of Men.	Seals taken.
1840	13	650	17,300	1875	20	1200	71,640
1845	39	1950	94,830	1880	14	840	41,468
1850	32	1600	74,058	1881	14	840	23,984
1856	54	2700	81,500	1882	15	900	21,082
1861	46	2300	10,350	1883	17	1020	49,806
1865	26	1300	112,000	1884	20	1200	42,120
1870	22	1320	128,000				

The Norwegian vessels are all steamers, sheathed with wood and iron, the crews averaging forty-six men. They belong principally to Tonsberg, but Tromsø also sends out a number of small vessels to hunt adult seals. The total annual product has reached \$300,000. Over twenty Norwegian and Swedish steamers are engaged in this fishery. Since about the year 1873 or 1874 the Norwegians and Swedes have discovered a new fishing-ground for adult seals off the coast of Greenland between Iceland and Cape Farewell. It is carried on in the months of June and July. The seals taken are all of the hood kind. At one time the Jan Mayen fishery averaged 200,000 seals annually among all the nationalities engaged. It does not now exceed 120,000 to 130,000.

The Danes, the Eskimo, and the half-breeds carry on a seal-fishery off the western coast of Greenland between Cape Farewell and 79° N. lat. The seals taken are chiefly the floe or spotted seal and the square flipper. Rink, in his *Greenland*, estimates the annual number taken at 89,000, but at present it does not exceed 50,000, as the seals are becoming scarcer. The oil is made at the Danish settlements on the coast, and the skins are dried, not salted, and both are shipped to Denmark.

The fisheries of Nova Zembla, once productive, have declined in value, and are now carried on by only five vessels, which reach the island about the end of June. The fishermen commence with hunting the seal and the walrus and afterwards fish for the common trout. Five kinds of seals are found here, the chief being the *Phoca vitulina* and the *Phoca grænelandica*. The number taken is small.

The Russians carry on a seal-fishery on the eastern and western coasts of the White Sea, in the bays of the Dwina and the Mezen and on the coast of Kanin. The species is the *Phoca grænelandica*. These seals live in the high regions of the polar seas from May till September, and appear later in the gulfs and bays of the Arctic Ocean, where the young are born on the floating ice early in February. Soon after the hunt commences and lasts till the end of March. On the eastern coast of the White Sea the chase is pursued over a space of 230 miles. Two thousand hunters assemble at Kedy, near Cape Voronoff. High wooden towers are erected along the shore, whence observers watch the movements of the seals. Hunting sheds for the men are also erected. When a herd of seals is observed, the men go out on the ice, drawing small boats after them, and kill the young and old with clubs and guns. To approach the seals without being discovered, the hunters muffle themselves in long white shirts and advance slowly and noiselessly over the snow. They are often exposed to the greatest dangers, owing to the sudden movements of the ice. In following up the chase in April they use sailing boats 22 feet long, with an iron-plated bottom, which they draw up on the ice, where a vast encampment is formed, and shooting-parties search for the seals. On the western shore of the White Sea the seal-hunt is less productive than on the eastern. The hunters meet at Devyatoe, a few miles north of the river Ponoï. About 500 men engage in the chase. The Russians take each year in the Arctic Ocean and the White Sea from 2,500,000 to 3,000,000 lb of seal blubber. Allowing an average of 40 lb per seal, this would imply the capture of 65,000 to 75,000 seals. The skins are made into leather.

The most extensive and valuable seal-fishery of the Russians is in the Caspian Sea, where the seals (*Phoca caspica*) are plentiful. They pass the summer in deep water, and in the autumn resort to the eastern basin, where the ice forms earliest and breaks up latest. Here the pairing takes place on the ice in December and January. The seals are also hunted at the mouths of the Volga and the Ural, and in the southern part of the sea, on the islands of the Gulf of Apsheron. There are three methods of hunting the seals,—killing them with clubs (the commonest and most successful way), shooting them on the ice, and taking them in nets. From 180,000 to 140,000 are taken annually.

A few seals are taken off the coast of California and Washington Territory. In the South Pacific, off the coast of Chili, only a few are now taken where formerly they were captured by the thousand.

The elephant seal or sea elephant (*Macrorhinus leonina*) was formerly taken in great numbers at various places for the sake of

its oil. This fishery is now almost a thing of the past; since about 1875 it has been carried on solely from New London in Connecticut, the fleet numbering only four or five vessels. The yield in 1880 was 42,000 gallons of oil, worth \$21,420.

The average number of hair seals taken annually may be estimated as follows:—

	Seals.
Newfoundland, including Labrador and the Gulf of St Lawrence	400,000
Canadian net fishery, Gulf of St Lawrence	75,000
Jan Mayen and the adjacent seas	130,000
Western Greenland	50,000
Nova Zembla, White Sea, and Arctic Ocean	75,000
Caspian Sea	140,000
North and South Pacific	5,000

Total number of hair seals	875,000
Value at \$2.50 per seal	\$2,187,500

Fur Seals.—The fur seals occupy two distinct areas. None exist on the shores of the North Atlantic. South of the equator they extend from near the tropics to the region of antarctic ice. By far the most important and valuable fur seal fisheries are those carried on at St Paul's and St George's Islands, belonging to the Pribyloff group,¹ off the coast of Alaska, at the Commander Islands in the Behring Sea, and that in the same sea 700 miles west of the Alaskan seal islets. The species found here is the northern fur seal (*Callorhinus ursinus*). The males attain mature size about the eighth year, when their length is from 7 to 8 feet, their girth from 7 to 8 feet, and their weight, when in full flesh, from 500 to 700 lb. The females are full grown at four years old, when they measure 4 feet in length, 2½ in girth, and weigh from 80 to 100 lb. The yearlings weigh from 30 to 40 lb. The seals resort to these islands late in spring chiefly for reproductive purposes, making their appearance from the southward. The number annually visiting St Paul's and St George's is estimated at five millions. About the middle of April the males begin to arrive and take their places along the shore in "the rookeries," as the breeding-grounds are called. The younger males are prevented from landing by the older, and are compelled either to stay in the water or to go to the uplands. By the middle of June all the males have assembled, and then the females begin to appear. Each old male seal collects from ten to fifteen or more females, whom he guards most jealously. The males fight furiously, "so that night and day the aggregated sound is like that of an approaching railway train." By the middle of July the family circle is complete. Soon after landing the female gives birth to one pup, weighing about 6 lb, which she nurses at wide intervals without any affection. Pairing takes place soon afterwards. No food is taken by the breeding males while on the rocks,—a period of three to four months. When the males leave after this long fast, they are reduced to half their former weight. In the end of October and middle of November all leave the island, the young males going last and by themselves.

The killing of the seals is carefully regulated. No females are killed, and only a certain number of young "bachelor" seals whose skins are of superior quality. These younger male seals are spread out on the slopes above the rookeries to rest. A party of men armed with clubs of hard wood quietly creep between them and the shore, and at a given signal start up with a shout and drive the seals inland. When they reach the killing-grounds near the villages, they select those that are two or three years old and seem likely to yield the most valuable fur. These they despatch with a club. The skins are carefully salted for exportation. Besides the skin each seal yields about a gallon and a half of oil. But it is not used, as its rank odour renders refining very costly. The value of the skins in the raw state varies from five to twenty-five dollars each; at times, when furs are specially fashionable, a higher price is obtained. The quality of the Alaska furs is superior, but those obtained in the South Shetland and antarctic regions are rated best. A cloak of the richest fur seal, a yard deep or more, will cost from £25 to £40. The roots of the loose exterior hairs penetrate deeper into the skin than those of the fur or short hair, and can readily be cut by paring on the fleshy side, without touching the roots of the fur; the long hairs then drop off, leaving the valuable fur below in a sheet like pure velvet. The number of seals killed on the Pribyloff Islands is limited to 100,000 annually, and with the precautions taken they increase as fast as if left to themselves, "for when the number of males is in excess, the continual fighting on the rookeries destroys many of both females and young, which get trampled to death."

Alaska was purchased from Russia by the United States in 1867. The Pribyloff Islands were leased to the Alaska Commercial Com-

pany of San Francisco for twenty years, from 1st May 1870, under Act of Congress approved 1st July 1870. The annual rental is \$55,000 with a tax of \$2.62 on each skin taken,—making the total rental \$317,000 per annum. The Alaska Commercial Company have leased the Commander Islands from the Russian Government. About 30,000 fur seals are annually taken there.

The fishery at the mouth of the Straits of Juan de Fuca and its vicinity is carried on by Americans and Canadians. The seals are captured in the waters, the largest number being secured at and about Cape Flattery, to the extent of 15,000 annually. The Lobos Islands, at the mouth of the Rio de la Plata, are under the protection of the Government of Uruguay, the number of seals annually taken being limited to about 12,000. Some of the numerous islands about Cape Horn are the breeding-places of fur seals, as are also the South Shetland Islands farther south. This Cape Horn region is visited by a fleet of seven to ten vessels belonging to New London and Stonington, Connecticut, and also by a few Chilean and other South American vessels. Only occasionally does a vessel visit the South Shetlands, though the quality of skins to be secured there is very superior. The headquarters for the fleet between seasons is at Punta Arenas, or Sandy Point, in the Straits of Magellan. The American fleet in 1880 numbered nine vessels of 1192 tons. The result of the fishery was 9275 skins, worth \$90,431. Early in the 19th century the Falkland Islands abounded in fur seals, but they have been exterminated. The number now (1886) annually secured there does not average more than 500; in some years only 50 skins are taken.

There are annually received at London from the Cape of Good Hope about 10,000 sealskins taken at various islands in the Southern Indian Ocean and along the south-west coast of Africa. A few fur seals are taken in the Okhotsk Sea.

Nearly all the fur-seal skins find their way to London, where they are plucked, dressed, and dyed. A few, however, are prepared in New York. At the seal islands they are salted and baled with the fur inside, and in this manner shipped to London. The annual yield of the fur-seal fisheries of the world is about 185,000.

	Seals.
Pribyloff Islands, Alaska	100,000
Commander Islands	30,000
Straits of Juan de Fuca and vicinity	15,000
Lobos Islands, mouth of Rio de la Plata	12,000
Patagonia, including South Shetland Islands and Straits of Magellan	15,000
Falkland Islands	500
Cape of Good Hope, including south-west coast of Africa and islands in Southern Indian Ocean	10,000
Islands belonging to Japan	2,500
Total	185,000
At an average of \$7 per skin the annual value would be	\$1,295,000
Value of hair seals annually	2,187,500
Total value of hair and fur seals	\$3,482,500

Allen, *Eared Seals*; Charles Bryant, *Habits of the Northern Fur Seal*; H. W. Elliott, *Seal Islands of Alaska*. (M. H.)

SEA LAWS, a title which came into use amongst writers on maritime law in the 16th century, and was applied by them to certain mediæval collections of usages of the sea which had been recognized as having the force of customary law, either by the judgments of a maritime court or by the resolutions of a congress of merchants and shipmasters. To the former class belong the sea laws of Oléron, which embody the usages of the mariners of the Atlantic; under the latter come the sea laws of Wisby, which reflect the customs of the mariners of the North Sea and of the Baltic.

The earliest collection of such usages which was received in England is described in the *Black Book of the Admiralty* as the "Laws of Oléron," whilst the earliest known text is contained in the *Liber Memorandum* of the corporation of the City of London, preserved in the archives of their Guildhall. These laws are in an early handwriting of the 14th century, and the title prefixed to them is *La Charte d'Oleroun des Juggementz de la Mier*. How and in what manner these "Judgments of the Sea" came to be collected is not altogether certain. Cleirac, a learned advocate in the parliament of Bordeaux, in the introduction to his work on *Les Us et Coustumes de la Mer*, first printed at Bordeaux in 1647, states that Eleanor, duchess of Guienne (the consort of Louis VII. of France, but subsequently divorced from him and married to Henry II. of England), having observed during her visit to the

¹ The sea-lion (*Eumetopias stelleri*) is a characteristic pinniped of the Pribyloff Islands and other parts of Alaska. It has very little commercial value; but by the natives along the Behring Sea coast of Alaska, Kamchatka, and the Kuriles it is highly prized. From the hide they make coverings for their boats; the intestines are made into garments; the stomach walls are used as pouches for oil; the flesh is dried and eaten; and the whiskers are sold to the Chinese, who use them as pickers to their opium pipes, and in several ceremonies in their joss houses.

Holy Land, in company with Louis, that the collection of customs of the sea contained in *The Book of the Consulate of the Sea* (see vol. vi. p. 317) was held in high repute in the Levant, directed on her return that a record should be made of the judgments of the maritime court of the island of Oléron (at that time a peculiar court of the duchy of Guienne), in order that they might serve as law amongst the mariners of the Western Sea. He states further that Richard I. of England, on his return from the Holy Land, brought back with him a roll of those judgments, which he published in England and ordained to be observed as law. It is probable that the general outline of Cleirac's account is correct, as it accords with a memorandum on the famous roll of 12 Edw. III., "De Superioritate Maris Angliæ," which, having been for many years carefully preserved in the archives of the Tower of London, is now deposited in the Public Record Office. According to this memorandum, the king's justiciaries were instructed to declare and uphold the laws and statutes made by the kings of England, in order to maintain peace and justice amongst the people of every nation passing through the sea of England: "Quæ quidem leges et statuta per dominum Ricardum, quondam regem Angliæ, in reditu suo a Terra Sancta correctæ fuerunt, interpretata, declarata, et in Insula Oleron publicata, et nominata in Gallica lingua La Leye Olyroun."

The earliest version of these Oléron sea laws, which, according to the memorandum above mentioned, were received in England in the latter part of the 12th century, comprised certain customs of the sea which were observed in the wine and the oil trade, as carried on between the ports of Guienne and those of Brittany, Normandy, England, and Flanders. No English translation seems to have been made before the *Rutter of the Sea*, printed in London by Thomas Petyt in 1536, in which they are styled "the Lawes of ye Yle of Auleron and ye Judgements of ye See." French was, in fact, a tongue familiar to the English High Court of Admiralty down to the reign of Henry VI. A Flemish text, however, appears to have been made in the latter part of the 14th century, the *Purple Book of Bruges*, preserved in the archives of Bruges, in a handwriting somewhat later than that of the *Liber Memorandum*. Prefixed to this Flemish version is the title, "Dit es de Coppie van den Rollen van Oleron van den Vonnesse van der Zee." Certain changes, however, have been made in the *Purple Book of Bruges* in the names of the ports mentioned in the original Gascon text. For instance, Sluys is in several places substituted for Bordeaux, just as in the *Rutter of the Sea* London replaces Bordeaux. That these sea laws were administered in the Flemish maritime courts may be inferred from two facts. First, a Flemish translation of them was made for the use of the maritime tribunal of Damme, which was the chief Flemish entrepôt of the wine trade in the 13th century. The text of this translation has been published by Adriaen Verwer under the title of the *Judgments of Damme*. In the second place, there is preserved in the archives of the senate of Dantzic, where there was a maritime court of old, famous for the equity of its judgments, an early manuscript of the 15th century, which contains a Flemish reproduction of the Judgments of Oléron headed "Dit is Twater Recht in Vlaenderen." So far there can be no doubt that the Judgments of Oléron were received as sea laws in Flanders as well as in England in the 14th century. Further inquiry enables us to trace them as they followed the course of the wine trade in the North Sea and the Baltic Sea. Boxhorn, in his *Chronyk van Zeelande*, has published a Dutch version of them, which Van Leeuwen has reproduced in his *Batavia Illustrata*, under the title of the *Lawes of West-Capell* in Zeeland. Verwer has also pub-

lished a Dutch text of them in his *Nederlant's See-Rechten*, accompanied by certain customs of Amsterdam, of which other MSS. exist, in which those customs are described as usages of Stavoren, or as usages of Enkhuizen, both ports of active commerce in the 15th century. Of these customs of Amsterdam, or, as they were more generally styled, "Ordinances of Amsterdam," further mention is made below.

A new and enlarged collection of sea laws, purporting to be an extract of the ancient laws of Oléron, made its appearance in the latter part of the 15th century in *Le Grant Routier de la Mer*, printed at Poitiers in France by Jan de Marnef, at the sign of the Pelican. The title-page is without a date, but the dedication, which purports to be addressed by its author Pierre Garcie alias Ferrande to his godson, is dated from St Gilles on the last day of May 1483. It contains forty-seven articles, of which the first twenty-two are identical with articles of the "Judgments of the Sea," in the *Liber Memorandum*, the remaining articles being evidently of more recent origin. A black-letter edition of this work in French, without a date, is preserved in the Bodleian Library at Oxford, and to the last article this colophon is appended: "Ces choses précédentes sont extraictes du très utile et profittable Roolle Doloiron par le dict Pierre Garcie alias Ferrande." An English translation is printed in the appendix to *A View of the Admiral Jurisdiction*, published in 1661 by Dr John Godolphin, in which the laws are described as "an Extract of the Ancient Laws of Oléron rendered into English out of Garsias alias Ferrand." Although this new text had the recommendation of an advocate who had filled the office of judge of the Admiralty Court during the Commonwealth and been appointed king's advocate-general by Charles II., it seems to have been superseded in a short time by Cleirac's *Us et Coustumes de la Mer*, to which was appended the following clause of authentication: "Tesmoin le Seel de l'Isle d'Oléron, estably aux contracts de la dite Isle, le jour du Mardy apres la Feste Saint André l'an mille deux cens soixant-six." Cleirac does not inform us from what source or under what circumstances he procured his text, nor on what authority he has adopted in certain articles readings at variance with those of Garcie, whilst he retains the same number of articles, to wit, forty-seven. The clause of authentication cannot be accepted as a warranty above suspicion, as the identical clause of authentication with the same date is appended to the early Norman and Breton versions of the rolls, which contain only twenty-six articles. Cleirac's version, however, owing probably to the superior style in which it was edited, and to the importance of the other treatises on maritime matters which Cleirac had brought together for the first time in a single volume, seems to have obtained a preference in England over Garcie's text, as it was received in the High Court of Admiralty during the judgeship of Sir Leoline Jenkyns, and an English translation of it was introduced into the English translation of the *Black Book of the Admiralty* made by John Bedford, the deputy registrar of the High Court, and dedicated to Sir Leoline Jenkyns. It seems to have been Bedford's intention to print this translation under the title of "Sea Laws"; but the manuscript passed into the hands of Sir Leoline Jenkyns, who gave it to the College of Advocates in 1685. The *Black Book* itself, which was missing for a long time from the Admiralty registry, has recently been discovered and has been replaced in the archives of the Admiralty Court. Of these two versions of the sea laws of Oléron the earlier obtained a wide-world reception, for it was translated into Castilian (*Fuero de Layron*) by order of King Alphonso X., and a Gascon text of it is still preserved in the archives of Leghorn, apparently in a handwriting of the 15th cen-

tury, entitled "Asso es la copia deus Rolles de Leron de jugemens de mar."

The parent stock of the Wisby sea laws would appear to have been a code preserved in the chancery of Lübeck, drawn up in the Old Saxon tongue, and dated 1240. This code contains amongst many others certain articles on maritime law which are identical with articles in the Gothland sea laws, Gothland being the island of which Wisby was the chief port. This collection comprises sixty-six articles, and it is now placed beyond a doubt by recent researches, especially of Professor Schlyter of Lund, that these Gothland sea laws are a compilation derived from three distinct sources,—a Lübeck, an Oléron, and an Amsterdam source. A Saxon or Low German text of this collection was printed for the first time in 1505 at Copenhagen by Godfrey de Gemen, a native of Gouda in Holland, who is reputed to have set up the earliest printing-press in Copenhagen. This print has no title-page, and in this respect resembles the earliest known print of *The Consulate of the Sea*; but upon a blank leaf, which occupies the place of a frontispiece in one of two copies of Godfrey de Gemen's text, both preserved in the royal library at Copenhagen, there has been inserted with a pen in alternate lines of black and red ink the title "Dat hogheste Gotlansche Water-Recht gedruket to Kopenhagen Anno Domini m.d.v.," and there has also been inserted on the first page of the text the introductory title "Her beghynt dat hogheste Water-Recht" (here begins the supreme sea law). Professor Schlyter has discovered a MS. (No. 3123) in the royal library at Copenhagen, which is written on parchment in a hand of the 15th century, and from which it seems probable that Godfrey de Gemen mainly derived his text, as it comprises the same number of articles, containing the same matter arranged in the same order, with this minor difference, that, whilst both the MS. and the print have the simple title "Water-Recht" prefixed to the first article, the MS. has also a similar title prefixed to the fifteenth. Further, as this article together with those that follow it in the MS., appears to be in a handwriting different from that of the articles that precede, the fifteenth article may justly be considered as the first of a distinct series, more particularly as they are numbered in Roman characters, beginning with § 1, and such characters are continued with a single interruption down to the end of the MS. Although, however, the numeration of the articles of this second series is continuous and the handwriting of the MS. from the fifteenth to the sixty-sixth article is unchanged, the text of the series is not continuous, as the fortieth article commences with an introductory clause—"This is the ordinance which the skippers and merchants have resolved amongst themselves as ship law." There is no difficulty in recognizing the first division of this second series of sea laws as a Low German version of the Judgments of Oléron, transmitted most probably through a Flemish text. This hypothesis would account for the substitution in several articles of Sluys for Bordeaux. On the other hand, the introductory clause which ushers in the fortieth article is identical with the title that is generally prefixed to MSS. of the maritime Ordinances of Amsterdam, and the text of this and of the following articles down to the sixty-fifth inclusive is evidently of Dutch origin and more or less identical with Verwer's text of the usages of Amsterdam. M. Pardessus, in his valuable *Collection de Lois Maritimes*, published in Paris before Professor Schlyter made known the result of his researches, has justly remarked that the provisions of several articles of this last division of the sea laws are inconsistent with the theory that they originated at Wisby. It may be observed that the sixty-sixth article of the MS. is a Lübeck law identical with the first article of the first

series, which is of Lübeck origin. No colophon is appended to this final article in the MS. Nevertheless, Godfrey de Gemen's edition of 1505, which breaks off in the middle of the sixty-sixth article of the MS., has the following colophon:—"Here end the Gothland sea laws, which the community of merchants and skippers have ordained and made at Wisby, that all men may regulate themselves by them. Printed at Copenhagen, A.D. m.d.v." The question naturally suggests itself, To what MS. was Godfrey de Gemen indebted for this colophon, or is the alternative more probable that he devised it? There is no known MS. of this collection of an earlier date to which an appeal can be made as an authority for this colophon; on the contrary, the only known MSS. of which the date is earlier than Godfrey de Gemen's print, both of which are in the library of the university of Copenhagen, are without this colophon, and one of them, which purports to have been completed at Nyköping on the Eve of the Visitation of the Virgin in 1494, concludes with a colophon which precludes all idea that anything has been omitted by the scribe, viz., "Here ends this book, and may God send us his grace, Amen." We are disposed to think that Gemen himself devised this colophon. He was engaged in printing for the first time other collections of laws for the Danish Government, and, as Gothland was at that time a possession of Denmark, he may have thus distinguished the sea laws from another collection, namely, of land laws. Professor Schlyter, however, believes Gemen may have borrowed it from a MS. which is lost, or at all events is not known. There is some support to this view in the fact that in the archives of the guildhall of Lübeck there is preserved a MS. of 1533 which contains a Low German version of the same collection of sea laws, with a rubric prefixed to the first article announcing them to be "the water law or sea law, which is the oldest and highest law of Wisby," and there are good reasons for supposing that the scribe of this MS. copied his text from a MS. other than the Copenhagen MS. The same observation will apply to a second MS. of a similar character preserved in the library of the gymnasium of Lübeck, which purports to have been written in 1537. But as regards the Wisby sea laws little reliance can be placed on such rubrics or colophons as proofs of the facts recited in them, though they may be valuable as evidence of the reputed origin of the sea laws at the time when the scribe completed the MS. In illustration of this view it may be stated that in the same year in which the more recent of these two MSS. purports to have been completed—namely, 1537—there was printed at Lübeck an enlarged edition of the sea laws consisting of seventy-two articles, being a Low German translation of a Dutch text, in which six additional Dutch laws had been inserted which are not found in the Copenhagen MS., nor have a place in Gemen's text, yet to this edition is prefixed the title, "This is the highest and oldest sea law, which the community of merchants and shipmasters have ordained and made at Wisby, that all persons who would be secure may regulate themselves by it." Further, it has an introductory clause to its thirty-seventh article—"This is the ordinance which the community of skippers and merchants have resolved upon amongst themselves as ship law, which the men of Zealand, Holland, Flanders hold, and with the law of Wisby, which is the oldest ship law." At the end of the seventy-second article there follows this colophon: "Here ends the Gothland sea law, which the community of merchants and mariners have ordained and made at Wisby, that each may regulate himself by it. All honour be to God, MDXXXVII." Each article of this edition has prefixed to it after its particular number the word "belevinge" (judgment). It would thus appear that the Wisby sea laws

have fared like the Oléron sea laws: they have gathered bulk with increasing years.

The question remains to be answered, How did this collection of sea laws acquire the title of the "Wisby sea laws" outside the Baltic? for under such title they were received in Scotland in the 16th century, as may be inferred from extracts from them cited in Sir James Balfour's *System of the more Ancient Laws of Scotland*, which, although not printed till 1754, was completed before his death in 1583. The text of the Wisby sea laws generally current in England is an English translation of a French text which Cleirac published in 1641 in his *Us et Coustumes de la Mer*, and is an abbreviated, and in many respects mutilated, version of the original sea laws. This inquiry, however, would open a new chapter on the subject of the northern sea laws, and the civilizing influence which the merchants of Wisby exercised in the 13th century through their factories at Novgorod, linking thereby the trade of the Baltic to that of the Black Sea.

Siècle* (6 vols., Paris, 1828-45); Schlyter, *Wisby Stadslog och Sjöfart*, being vol. viii. of the *Corpus Juris Sueco-Gotorum Antiqui* (Lund, 1853); and *The Black Book of the Admiralty*, ed. by Sir Travers Twiss (4 vols., London, 1871-76). (T. T.)

SEALING WAX. In mediæval times, when the principal use of sealing wax was for attaching the impression of seals to official documents, the composition used consisted of a mixture of Venice turpentine, beeswax, and colouring matter, usually vermilion. The preparation now employed contains no wax. Fine red stationery sealing wax is composed of about seven parts by weight of shellac, four of Venice turpentine, and three to four of vermilion. The resins are melted together in an earthenware pot over a moderate fire, and the colouring matter is added slowly with careful stirring. The mass when taken from the fire is poured into oiled tin moulds the form of the sticks required, and when hard the sticks are polished by passing them rapidly over a charcoal fire, or through a spirit flame, which melts the superficial film. For the brightest qualities of sealing wax bleached lac is employed, and a proportion of perfuming matter—storax or balsam of Peru—is added. In the commoner qualities considerable admixtures of chalk, carbonate of magnesia, baryta white, or other earthy matters are employed, and for the various colours appropriate mineral pigments. In inferior waxes ordinary resin takes the place of lac, and the dragon gum of Australia (from *Xanthorrhoea hastilis*) and other resins are similarly substituted. Such waxes, used for bottling, parcelling, and other coarser applications, run thin when heated, and are comparatively brittle, whereas fine wax should soften slowly and is tenacious and adhesive.

SEALKOTE. See **SIALKOT**.

SEALS¹ (Gr. *σφραγίς*, Lat. *sigillum*). During the mediæval period the importance of seals was very great, as they were considered the main proofs of the authenticity of all sorts of documents, both public and private.² That is much less the case now, the written signature being thought a safer guarantee of genuineness. In order to make illicit use or imitation of a seal difficult, the seal itself was usually locked up and guarded with special care, and in the case of royal personages or corporate bodies was often made a very complicated work of art, which it would have been almost impossible to copy exactly. One very curious precaution that was adopted is still in use with the corporate seal of the monasteries of Mount Athos. The circular matrix³ is divided into four quarters, each

of which is kept by one of the four *epistatari* or ruling monks; the four pieces are joined by a key-handle, which remains in the custody of the secretary. Thus it is only when all five guardians of the various parts of the matrix meet together that the complete seal can be stamped on any document. The device on the Mount Athos seal is a half-length figure of the Madonna and Child, and the imprint is made by blackening the matrix in the flame of a lamp and then pressing it on the paper or vellum itself. Mediæval seals were applied in two different ways: in one the stamp was impressed in wax run on the surface of the document (Fr. *plaqué* or *en placard*); in the other the wax impression was suspended by cord or strips of parchment (Fr. *pendant*). The latter method was necessarily used with metal seals or *bullæ* (see below).

For the sake of greater security in the case of *plaqué* seals, it was a common practice from the 12th century onwards, or even earlier, to make a cross cut in the vellum of the document, the corners of which were then turned back, thus forming a square opening, over which the wax seal was stamped; the turned-up corners helped to hold the wax in its place, and the aperture allowed a second matrix to be applied at the back. This was usually a smaller private seal called a *secretum*. Thus, for example, an abbot would use on the front of a document the large corporate seal of his community, and on the back would stamp his personal seal as a *secretum*.

Till the 12th century pure white beeswax was generally used, after that wax coloured green or red. The use of shellac or other harder materials, such as modern sealing-wax, is of recent date. Thus it was usual to protect the soft wax seals by some sort of "fender," often a wreath of rushes or plaited strips of paper twisted round it; another method much employed in the 15th century was to cover the seal with leaves of oak, bay, or beech. *Pendant* seals were often encased in boxes of wood or *cuir bouilli*, which in some cases are very richly decorated. From the 13th to the 15th century original royal documents are usually on fine vellum and have green seals hung by many-coloured silk and gold thread, while office copies are on coarser vellum and have white seals hung by parchment strips. In England an important official, called the clerk of the chafe-wax, an office which still exists, was entrusted with the duty of softening the wax for state seals over a chafing-brazier. Two different methods of sealing documents, either closed or open for inspection, are recorded in the legal terms "letters secret" and "letters patent."

Owing to the enormous number of mediæval seals which still exist, and their frequently great historical and artistic importance, it is necessary to adopt some method of classification, especially for large collections, such as that of the British Museum, which contains about 25,000 specimens, and the very important one of the Society of Antiquaries.⁴ The chief classes are these:—(1) *Ecclesiastical*.—(a) Seals belonging to offices, such as those of popes, bishops, abbots, deans, &c.; (b) common seals of corporate bodies, such as chapters, religious colleges, monasteries, and the like; (c) official seals without the name of the officer; (d) personal seals, with or without a name. (2) *Lay*.—(a) Royal seals, including those of queens and royal princes; (b) official seals in the name of the sovereign or a state official; (c) common seals of corporate bodies, such as towns, universities, guilds, schools, hospitals, &c.; (d) personal seals (not being royal) with effigies, heraldry, merchants' marks, or other devices, with or without a name, or with name only, or with legend only.

and the object that makes the impress. More correctly the latter is called the "matrix," and only the impression is called the "seal."

⁴ This valuable collection has been arranged and catalogued by Dr C. S. Percival, the best modern authority on English seals.

¹ For antique seals, see **GEMS, JEWELLERY, and RING**.

² In some cases, in the presence of witnesses, a seal which did not belong to the signer of a document was used when the right matrix was not at hand. This has naturally caused many archaeological puzzles.

³ The word "seal" is often used to denote both the impression made

*French Royal Seals.*¹—The earliest and most complete series of seals is that of the French kings. The Carolingian and Merovingian monarchs mostly used antique gems or pastes,—portrait heads being selected and a legend added in the metal setting of the matrix. Charlemagne used a head of Jupiter Serapis,² Pippin the Short that of the Indian Dionysus. The British Museum possesses a seal of Odo or Eudes, king of France (888-898), impressed from a fine Greek gem of the 3d century B.C., with a portrait of Seleucus IV. The oldest existing matrix is that of Lothaire I. (c. 817), now preserved at Aix-la-Chapelle, attached to an altar-cross. It is an oval intaglio in rock crystal, with a laureated portrait and the legend \ddagger XPE. ADIVVA. HLOTHARIVM. REG.; it is not an antique, but is of contemporary Byzantino-Rhenish work. Till the time of Louis VI. (1108-1137) these seals were *plaqué*, but he introduced *pendant* seals about 1108; and counter-seals at the back were first used by Louis VII. (1137-80). The grand series of round seals with an enthroned figure of the king begins with the Capet Henry I. (1031-60). The king holds a sceptre in one hand and a flower in the other. Those of the queens are frequently of a pointed oval form, with a standing portrait figure holding a flower in each hand. In the 13th and 14th centuries the French royal seals were elaborate works of art, with a finely draped figure of the king seated under a rich canopy on a throne, decorated with lions' or eagles' heads; the king holds a sceptre in each hand. The queens' seals, of a round or pointed oval form, are also very beautiful, with a graceful figure standing between two shields under a rich canopy. After the 15th century there was a rapid decadence in the royal seals, and in the 17th and 18th centuries they were of the most tasteless style, far worse than those used in England at the same date.

English Royal Seals.—This, which is on the whole the most beautiful of all royal series, begins with the seal of Edward the Confessor (see fig. 1).³ The great seal of William the Norman and his successors was not *plaqué*, like the earlier ones, but pendant; it has on one side an enthroned figure of a king copied from contemporary French seals, and on the reverse the king on horseback armed with spear and shield. These two ways of representing the sovereign have been used on all the royal seals of England down to the present day. By degrees greater elaboration of ornament was introduced into the throne and its canopy. In Edward III.'s time niches with minute statuettes of saints were added at the sides of the obverse. The climax of magnificence was reached in the reign of Henry V. On the obverse of his seal the king

FIG. 1.—Seal of Edward the Confessor.

sits holding the orb and sceptre; the gorgeous canopy contains statuettes of the Virgin and two saints, and at each side are three rows of statuettes in minute canopied niches, each row two tiers high; about fifteen minute figures of saints and angels are introduced into the design. On the reverse is the king on horseback, bearing a sword and shield; the horse, going at full speed, is clothed with richly embroidered heraldic drapery, and on its head and on the king's is a lion crest. After Henry V. the seals began to decrease in magnificence, and in the reign of Henry VII. the new taste of the Renaissance began to supplant the pure Gothic of the earlier seals. In the time of Philip and Mary both sovereigns appear together, seated under canopies, or riding side by side.⁴ The great seal of the Commonwealth is a marvel of ugliness. On the obverse is a perspective view of the interior of the House of Commons, and on the reverse a map of Great Britain and Ireland. Cromwell's seal has an equestrian portrait of himself, and its reverse the arms of the Commonwealth between a lion and a dragon as supporters. Little is noticeable about the seals of succeeding sovereigns; that of Victoria is minutely cut, but is very poor as a work of art.

Other English Seals.—Gilt bronze was the commonest material for large seals, but other metals were used, such as gold, silver, and lead, also jet and ivory, especially before the Norman Conquest. Rock crystal, carnelian, and sard were the favourites among the hard stones cut for matrices. Large seals were usually either round or of a pointed oval form (as in figs. 2 and 3); the small *secreta* were sometimes square, triangular, or hexagonal, as well as round or oval.⁵ The most elaborate and beautiful of all were those of religious corporations, such as the chapter seals of monasteries.⁶ These are among the most exquisite works of art that the Middle Ages produced, especially during the 14th century, and exceed in delicacy of workmanship and elaboration of design the finest seals of all other classes, not excepting those of the sovereigns. Fig. 2 shows the common seal of Boxgrove priory (Sussex), the matrix of which is now in the British Museum. On one side is a figure of the Virgin enthroned, and on the reverse a representation of the west front of the priory church, with open tracery and niches containing minute statuettes. This elaborate matrix is made up of four distinct pieces of gilt bronze, and to form the perfect seal must have been a work requiring considerable skill and patience. The reverse was formed by two stamps used on two separate plaques of softened wax: one of these formed

FIG. 2.—Fourteenth-century seal of Boxgrove priory; reverse.

the background with the various statuettes, and the second was used to stamp the open tracery work of the front of the church; the latter when hard was fitted on to the

¹ See Wailly, *Éléments de Paléographie*, vol. ii., pl. A.; by various authors, *Trésor de Num. et de Glyptique*, vol. i., Paris, 1834 (which contains also plates of English royal seals); Douet-d'Aroq, *Coll. de Sceaux de l'Empire*, Paris, 1863-68; *Bulletin de la Société de Spélagistique*, Paris, v. y.; D'Anisy, *Recueil de Sceaux Normands*, Caen, 1835.

² The monks of Durham also used a gem with a head of Jupiter Serapis, round which was added the legend—CAPVT. SANCTI. OSWALDI.

³ The English kings before the Conquest signed usually with a cross only, but a few, such as Offa, Ethelwulf, and Ethelred, occasionally used seals, especially on documents containing grants to St Denis and other French abbeys, on which they followed the French custom of affixing *plaqué* seals.

⁴ A variety of design is introduced on the reverse of one of Queen Elizabeth's seals: she is represented standing, holding the orb and sceptre, and wears a dress with enormous hoops. Her other seal has the usual equestrian portrait on the reverse.

⁵ As a rule, from the 12th to the 15th century, ecclesiastical seals and those of females were of the pointed oval form, most others being circular; there are, however, many exceptions to this rule.

⁶ A special English office for the blessing of seals is printed by Maskell, *Mon. Ritualia*, 1882, vol. iii.

impression of the background, and thus a sort of miniature model of the church was made, with its statues and the inner planes of the façade seen through the open tracery work,—the effect being extremely rich and delicate. When the finished obverse and reverse had been fitted together, the legend was added on their edges by means of the fourth piece of the matrix,—a strip of bronze with letters cut into it on both its edges; first one side and then the other of this strip was pressed against the rim of the wax seal, which thus received the impression of the complete legend all round its edge. The seal of Southwark priory, also of the 14th century, is even more elaborate, as both sides have open tracery separately applied, and thus the matrix consists of five distinct pieces. Many of the bishops' seals, though less complicated in design, are of equal beauty to those of the chapters. The common design has a standing figure under a richly decorated canopy. Fig. 3 shows a very beautiful example, the seal of Richard, bishop of Durham. The standing figure of the bishop in mass vestments is modelled with wonderful skill and shows extreme taste in the treatment of the drapery; the legend is s[igillum] RICARDI . DEI . GRA . DVNELMENSIS . EPI. A great variety of sacred subjects occur on ecclesiastical seals

FIG. 3.—Seal of Richard de Bury, late 14th century.

FIG. 4.—Seal of King's College, Cambridge.

in addition to single figures of patron saints; the most frequent were perhaps the Crucifixion, the Annunciation, the Coronation of the Virgin, and the Virgin enthroned in Heaven; small figures of kneeling worshippers were

often added. Fig. 4 shows one of the most magnificent of this class, with, in the centre, a figure of the Virgin in glory, between St Nicholas and Henry VI., each under a very rich canopy; at the sides are shields charged with England and France, and France (modern) alone, held by two monks.¹ This very beautiful work of art dates about the year 1443. In the 15th century the ecclesiastical seals began to fall off in richness and beauty, and after the Reformation were of little artistic value. Very handsome seals were used by lay corporations, especially the municipalities of towns. These last frequently have a careful representation of the town itself, with its circuit of walls or that of its chief castle or cathedral, and thus often afford valuable evidence as to the form of its defences and principal buildings. Fig. 5

shows a fine example, 3 inches in diameter,—the corporate seal of Rochester, made in the 13th century; it has a minute representation of the keep of Rochester Castle, surrounded by an outer circuit wall and a moat. On one of the turrets of the gateway is a sentinel blowing a signal horn; legend, SIGILLVM . CIVIVM . ROFENSIS. The reverse has the same legend repeated round the scene of the Crucifixion of St Andrew. Other corporation seals are covered with small figures under elaborate canopy work, much like those of the ecclesiastical foundations.

FIG. 5.—Corporate seal of Rochester.

Seals of hospitals are often designed in a similar way, with a representation of the hospital building very minutely treated. In the 15th century seals began to be designed in a rather pictorial style, which, though very graceful, is inferior to the earlier

and more architectonic class. Very magnificent seals were used by state officials: those of the lord high admiral of England are especially fine, from the beautiful form of the ship on the obverse. Fig. 6 shows that of the earl of Huntingdon, who was lord high admiral in the reign of Henry VIII. In design it resembles those of the admirals of the previous century. On the sails are embroidered the royal arms of England.

FIG. 6.—Seal of Lord High Admiral Huntingdon.

Among private seals those of powerful barons are often large and very beautifully cut. Fig. 7 shows a silver matrix, now in the British Museum, which is remarkable for the great beauty of its workmanship. Its legend is SIGILLVM . ROBERTI . FILII . WALTERI. On it an armed knight, of the time of Henry III., is riding over a dragon, whose tail ends in a scroll of very beautiful conventional foliage, modelled with the greatest spirit and delicacy.

¹ This class of seal is often a sort of miniature reproduction of some magnificent altar retable, as in fig. 4.

A common and graceful form of private seal in the 13th and 14th centuries has simply a shield with the owner's arms on a diapered background, the whole enclosed within many-cusped tracery. Fig. 8 shows an example of a fine Græco-Roman gem,—a carnelian engraved with a female head, full face. The 14th-century owner of this has added a metal setting with the words CAPVT. MARIE. MAGDALENE, to give it a sacred meaning. The legends of private seals or *secreta* were often chosen in allusion to their use; common phrases are "clausa secreta tego," or "lecta lege, tecta tege." Many ingenious devices were practised to enable the same matrix to give two or more different varieties of impression. In some cases the border with the legend was so contrived as to slide up the handle, so that the seal could be made either with or without an inscription. Others had the border made to revolve on a swivel, so as to supply two different legends; and the magnificent monastic seals (as that shown in fig. 2) were arranged so as to give a perfect seal without the use of the elaborate open tracery. In the 15th and 16th centuries merchants and handicraftsmen frequently employed devices connected with their trade—either some tool or badge or an arbitrary sign used as a trade-mark; or a rebus of the owner's name was used, such as a bolt and a tun (cask) for the name Bolton. The use of seals by the humbler classes was more common in England than abroad; even bondsmen sometimes had seals, both before and after the Norman Conquest. Seals of other countries mostly followed

FIG. 7.—Seal of Robert Fitzwalter, c. 1270.

FIG. 8.—Antique gem used as a private seal.

the same fashions as those of England, though of course varying in design and workmanship with each country. On the whole, the English seals were superior during their best period (the 14th century) to those of any other country, though matrices of great beauty were produced in both Germany and France. In Italy less care and skill were usually spent on seals, partly owing to the greater use of metal bullæ for important charters.

Metal Bullæ.—These are necessarily not *plaqué* but *pendant*, and are held usually by cords passed through a hole in the seal. Lead was the metal most commonly used, but some sovereigns had bullæ struck in silver or gold, either as a mark of their own dignity or to confer special honour on the recipient of a charter. An extant letter from Petrarch to Charles IV. thanks that emperor for a diploma of the rank of count, and especially for the honour shown to him by the attachment of gold bullæ to the document. Lead bullæ were also used by various ecclesiastical dignitaries, from patriarchs to bishops, but were rarely used by ecclesiastics of lower rank. In some cases, however, especially in Sicily and Byzantium, bullæ were used by laymen of very moderate rank. A large number of fine papal bullæ¹ exist dating from the 7th century onwards.² Since the time of Pope Paschal II. they have borne heads of St Peter and St Paul; previously they had such simple devices as crosses or stars, with the name of the pontiff. Another early series of bullæ begins in the 8th century with the bullæ of the patriarchs of Byzantium. Those of the doges of Venice exist in large numbers, bearing figures of St Mark and the reigning doge kneeling before him. Existing bullæ of Charlemagne have a rude profile portrait crowned with a diadem, and on the reverse the monogram of KAROLVS arranged in the form of a cross.

(J. H. M.)

SEAMANSHIP

SEAMANSHIP is the art of sailing, manœuvring, and preserving a ship or a boat in all positions and under all reasonable circumstances, and thus involves a sound practical knowledge of all the forces by which she may be actuated and the means at command to assist or counteract them; it is a branch of applied mechanics acquired by experience and study. The former can only be obtained thoroughly in many years spent at sea, in personal connexion with the work of the ship and her boats; that such training should commence at an early age is very desirable, if not even imperative. The practical knowledge so gained should be supplemented and improved by reading, conversation, and discussion, as the casualties which befall ships are so varied that a man may pass forty years in sea-going vessels without experiencing one-half of those which might occur. Many of the old maxims are still applicable to every class of vessel and must always remain so.

The terms "ship" and "vessel" are here intended to embrace all classes, though "ship" is generally applied to the larger without reference to form or description unless such is specified. Though the use of sails has been greatly superseded by the introduction of steam-power both in the navies of all nations and in the mercantile marine, it is still generally admitted that seamanship is best acquired

on board a vessel which is dependent upon her sails. The construction and equipment of sailing ships had reached a high point of perfection at the time steam came into general use. The power derived from the steam-engine does not change any of the former conditions, but simply adds another element, confined to propulsion directly ahead or astern (except with reversible wheels or twin screws), which when combined with sails renders a ship much more manageable and safe,—that is to say, assuming all the forces at command to be properly applied. Hence it is very desirable that all ocean-going steam vessels should have sufficient sail-power to turn them round (wear) or to enable them to sail with the wind abeam without steam, especially when fitted with single screws or with paddle wheels which do not work separately. Twin screws, of course, give a double chance as far as the engine is concerned; but even with that advantage the loss of the rudder would leave the ship in a helpless condition if she had not efficient head and after sails to balance her on the desired course.

At present the excessive desire to make quick passages has greatly augmented the danger unavoidably attending a sea voyage, the risk as well as the violence of a collision

¹ The term "bull" for a papal charter comes from its lead *bullæ*.

² See Ficoroni, *Piombi Antichi*, Rome, 1745.

at high speed in thick weather being thereby much increased. Through the want of masts and sails there is a probability of total loss by drifting helplessly on a lee shore during a gale, or by foundering "in the trough of the sea." In spite of her monstrous size (22,000 tons), the "Great Eastern," in 1863 or 1864, with her six comparatively small masts and weak sails was, after the loss of her rudder, very roughly used by the waves striking her full on the side. She was in the position which is expressed by the common sea-phrase "wallowing in the trough of the sea," from which her crew had no power to extricate her. A smaller vessel deeply laden in such a position would most probably have foundered, leaving no one to tell the tale. Too much stress is laid upon the retardation caused by masts and rigging when steaming head to wind; it is the pitching and plunging motion of the ship into a succession of waves that principally retards her speed. If the waves are approaching at the rate of 10 miles an hour and the ship is steaming against them at a similar rate, they will strike the bows with a force equal to 20 miles an hour. When a ship is steaming through comparatively smooth water (sheltered by land) against a gale of wind, her speed is but little reduced by the force of the wind alone, when other circumstances admit of her working full power. Storm-sails only require short masts, but these and the canvas they support should be strong, which is not the case in the merchant service generally.

Duties of
a sea-
man.

Every seaman is expected to be thoroughly acquainted with the rigging of the vessel in which he serves, and when in charge he should frequently examine every part, to see that it is efficiently performing the duty assigned to it, being neither too taut nor too slack, nor suffering from chafing, wet, or other injury. He should be capable of repairing or replacing any part with his own hand if necessary and of teaching others how to do so. He need not necessarily be a navigator, though a good navigator must be a seaman; nor is it necessary that a seaman should be a shipbuilder, a mast-maker, a rope-maker, or a sail-maker, but he should possess a general knowledge of each art, especially the last; every able seaman should be able to sew a seam and assist the ship's sail-maker in repairing sails. It is greatly to be regretted that various circumstances have brought about such a change in the system of rigging ships, in both the British navy and the mercantile marine, that those who sail in them seldom see it done. Young officers were in former times frequently entrusted with the charge of day watches, during which they would give the necessary orders for making, shortening, or trimming sails, perhaps even tacking and wearing. That practice gave confidence and quickened the desire to learn more; it was more frequently done in small than in large ships. The general adoption of the steam-engine in ships has not only diminished the value of sail-power but of seamanship also, and has produced such a change in the rig that instead of masts and yards we find only two or three poles. In the British navy so many new sciences have been introduced that seamanship takes but a low place among them at the examination of a midshipman, who has had but little boat duty and probably found the discussion of seamanship in his mess-place contrary to rule. The rapidity with which all sail and mast drill is executed, combined with the perfection of the "station bill," renders it worse than useless as a means of teaching, as it gives a false confidence which fails in the hour of necessity, when the accustomed routine is thrown out by a sail actually splitting to pieces or a spar snapping. The fact that the same men perpetually do the same thing must tend greatly to render each evolution quick so long as every one is in his accustomed place, but sickness or the absence of a party from duty will disorganize the ship for

some time, as the general usefulness of the men has been cramped. Sail drill in harbour is open to grave objections: unless in a tide-way, the ship must be invariably head to wind; for reefing and furling the yards are laid square, consequently flat aback; both earings are hauled out at once, and as it is only for exercise they are only half secured. Even when reefing top-sails at sea either for exercise or of necessity in company with other ships, the yards are laid square to enable the men to get readily on the weather-side; therefore, if on a wind, the sail must remain aback or the ship must be kept away till the wind is on the beam in order to shake the sail.

The foundation of all teaching of seamanship must be a Knots, knowledge of the knots, bends, and splices, and their use hitches, in the various parts of the rigging and equipment of a bends, ship.¹ Some knots, bends, and hitches are intended to afford security as long as desired, and then to be easily disengaged. Other knots, splices, and seizings are of a more permanent character, generally continuing as long as the rope will last.

Fig. 3.

Fig. 4.

Fig. 1.—Overhand Knot.

Fig. 2.—Figure-of-Eight Knot.

Fig. 3. } Bowline on a Bight.

Fig. 4. }

Overhand Knot.—Used at the end of ropes to prevent their unreeving and as the commencement of other knots. Fig. 1 represents an overhand knot hauled tight; for an illustration of the same not hauled tight see Knor, vol. xiv. p. 128, fig. 7.

Figure-of-Eight Knot (fig. 2).—Used only to prevent ropes from unreeving; it forms a large knob.

Reef Knot (see Knor, loc. cit., figs. 8 and 9).—First form an overhand knot; then take the end *a* over the end *b* and through the bight.² This knot is so named from being used in tying the reef points of a sail, since it will not jam. If the end *a* were taken under the end *b*, a *granny's knot* would be formed.

Bowline Knot.—Lay the end of a rope *a* over the standing part *b*; form with *b* a bight *c* over *a*; take *a* round behind *b* and down through the bight *c*. This is a very useful knot, forming a loop which will not slip. *Running bowlines* are formed by making a bowline round its own standing part above *b*. It is the most common and convenient temporary running noose. See Knor, l.c., figs. 11 and 12.

Fig. 5.

Fig. 6.

Fig. 7.

Fig. 8.

Fig. 5.—Two Half-Hitches.

Fig. 6.—Double Blackwall Hitch.

Fig. 7.—Cat's-paw.

Fig. 8.—Marling-Spike Hitch.

Bowline on a Bight (figs. 3, 4).—The first part is made similar to the above with the double part of the rope; then the bight *a* is pulled through sufficiently to allow it to be bent over past *d* and come up in the position shown in fig. 4. It makes a more comfortable sling for a man than a single bight.

Half-Hitch.—Pass the end *a* round the standing part *b* and through the bight.

¹ A person wishing to make sailor's knots need not be deterred by the want of material, as nearly all that are here represented were made, for the purpose of sketching them, with the lashing of a packing case.

² For an explanation of this and other technical terms, see the glossary on p. 608 below.

This hitch by itself round a large object would not hold and round a small one would jam excessively. See *KNOR, L.C.*, fig. 18.

Two Half-Hitches (fig. 5).—The half-hitch repeated; this is commonly used, and is capable of resisting to the full strength of the rope. A stop from *a* to the standing part will prevent it jamming.

Clove Hitch.—Pass the end *a* round a spar or rope and cross it over *b*, its standing part; pass it round again and put the end *a* through the second bight. This hitch is generally used at right angles to the object and is improved by adding a half-hitch with the end *a* round *b*. When pulled in a line with the spar it becomes simply two half-hitches. An illustration is given in *KNOR, L.C.*, fig. 15.

Double Blackwall Hitch (fig. 6).—Pass the end *a* twice round the hook and under the standing part *b* at the last cross. The ordinary Blackwall hitch only extends to the first cross at *b*, and is quickly formed by passing the hook of a jigger through the bight of a rope so that the end may be jammed between it and the standing part, as from *b* to *a*. Used for setting up top-gallant rigging and similar light work when a slip is of little consequence.

Cat's-paw (fig. 7).—Twist up two parts of a lanyard in opposite directions and hook the tackle in the eyes *i, i*. A piece of wood should be placed between the parts at *g*. A large lanyard should be clove-hitched round a large toggle and a strap passed round it below the toggle.

Marling-Spike Hitch (fig. 8).—Lay the end *a* over *c*; fold the loop over on the standing part *b*; then pass the marling-spike through, over both parts of the bight and under the part *b*. Used for tightening each turn of a seizing.

Fig. 9.—Fisherman's Bend. Fig. 10.—Studding-Sail Halyard Bend. Fig. 11.—Timber Hitch.

Fisherman's Bend (fig. 9).—Take two turns round a spar, then a half-hitch round the standing part and between the spar and the turns, lastly a half-hitch round the standing part.

Studding-Sail Halyard Bend (fig. 10).—Similar to the above, except that the end is tucked under the first round turn; this is more snug. A *magnus hitch* has two round turns and one on the other side of the standing part with the end through the bight.

Timber Hitch (fig. 11).—Take the end *a* of a rope round a spar, then round the standing part *b*, then several times round its own part *c*, against the lay of the rope.

Fig. 12.—Snaking. Fig. 13.—Carrick Bend. Fig. 14.—Inside Clinch. Fig. 15.—Midshipman's Hitch.

Snaking (fig. 12).—This consists of turns and crossings, the latter taken diagonally with a marling hitch each time. Used to keep woodings and seizings in place. The same term is applied to lines between the backstays to keep a broken part from falling.

Carrick Bend (fig. 13).—Lay the end of one hawser over its own part to form a bight as *e'*, *b*; pass the end of another hawser up through that bight near *b*, going out over the first end at *c*, crossing under the first long part and over its end at *d*, then under both long parts, forming the loops, and above the first short part at *b*, terminating at the end *e'*, in the opposite direction vertically and horizontally to the other end. The ends should be securely stopped to their respective standing parts, and also a stop put on the becket or extreme end to prevent it catching a pipe or chock; in that form this is the best quick means of uniting two large hawsers, since they cannot jam. When large hawsers have to work through small pipes, good security may be obtained either by passing ten or twelve taut racking turns with a suitable strand and securing each end to a standing part of the hawser, or by taking half as many round turns taut, crossing the ends between the hawsers over the seizing and reef-knotting the ends. This should be repeated in three places and the extreme ends well stopped. Connecting hawsers by bowline knots is very objectionable, as the bend is large and the knots jam.

Sheet Bend.—Pass the end of one rope through the bight of another, round both parts of the other, and under its own standing part. Used for bending small sheets to the clews of sails, which present bights ready for the hitch. An ordinary net is composed of a series of sheet bends. See *KNOR, L.C.*, fig. 20. A *weaver's knot* is made like a sheet bend.

Single Wall Knot.—Unlay the end of a rope, and with the strand *a* form a

bight; take the next strand *b* round the end of *a*; take the last strand *c* round the end of *b* and through the bight made by *a*; haul the ends taut. A *double wall* against the lay (not crowned) makes a good stopper. A *whale knot* is similar, but made with the lay. Fig. 21 of art. *KNOR, L.C.*, represents a single wall knot.

Single Wall Crowned.—Form a single wall, and lay one of the ends, *a*, over the knot; lay *b* over *a*, and *c* over *b* and through the bight of *a*; haul the ends taut. See *KNOR, L.C.*, fig. 22.

Double Wall and Double Crown.—Form a single wall crowned; then let the ends follow their own parts round until all the parts appear double; put the ends down through the knot. A very excellent and generally used cable-stopper. See *KNOR, L.C.*, fig. 23.

Matthew Walker.—Unlay the end of a rope. Take the first strand round the rope and through its own bight; the second strand round the rope, through the bight of the first, and through its own bight; the third through all three bights. Haul all taut. An easily made and useful knot. Illustrations are given in *KNOR, L.C.*, figs. 24 and 25.

Inside Clinch (fig. 14).—The end is bent close round the standing part till it forms a circle and a half, when it is securely seized at *a, b*, and *c*, thus making a running eye; when taut round anything it jams the end. It is used for securing hemp cables to anchors, the standing parts of topsail sheets, and for many other purposes. If the eye were formed outside the bight an *outside clinch* would be made, depending entirely on the seizings, but more ready for slipping.

Midshipman's Hitch (fig. 15).—Take two round turns inside the bight, the same as a half-hitch repeated; stop up the end; or let another half-hitch be taken or held by hand. Used for hooking a tackle for a temporary purpose.

Fig. 16.—Turk's Head. Fig. 17.—Spanish Windlass. Fig. 18.—Slings.

Turk's Head (fig. 16).—With fine line (very dry) make a clove hitch round the rope; cross the bights twice, passing an end the reverse way (up or down) each time; then keeping the whole spread flat, let each end follow its own part round and round till it is too tight to receive any more. Used as an ornament variously on side-ropes and foot-ropes of jibbooms. It may also be made with three ends, two formed by the same piece of line secured through the rope and one single piece. Form with them a diamond knot; then each end crossed over its neighbour follows its own part as above.

Spanish Windlass (fig. 17).—An iron bar and two marling-spikes are taken; two parts of a seizing are twisted like a cat's-paw (fig. 7), passed round the bar, and hove round till sufficiently taut. In heaving shrouds together to form an eye two round turns are taken with a strand and the two ends hove upon. When a lever is placed between the parts of a long lashing or frapping and hove round, we have what is also called a Spanish windlass.

Slings (fig. 18).—This is simply the bight of a rope turned up over its own part; it is frequently made of chain, when a shackle (bow up) takes the place of the bight at *s* and another at *y*, connecting the two ends with the part which goes round the mast-head. Used to sling lower yards. For boat's yards it should be a grummet with a thimble seized in at *y*. As the tendency of all yards is to cant forward with the weight of the sail, the part marked by an arrow should be the fore-side, easily illustrated by a round ruler and a piece of twine.

Fig. 19.—Sprit-Sail Sheet Knot. Fig. 20.—Turning in a Dead-Eye Cutter-Stay fashion. Fig. 21.—Turning in a Dead-Eye end up.

Sprit-Sail Sheet Knot (fig. 19).—This knot consists of a double wall and double crown made by the two ends, consequently with six strands,—with the ends turned down. Used formerly in the clews of sails, now as an excellent stopper, a lashing or shackle being placed at *s*, and a lanyard round the head at *z*.

Turning in a Dead-Eye Cutter-Stay fashion (fig. 20).—A bend is made in the stay or shroud round its own part and hove together with a bar and strand; two or three seizings diminishing in size (one round and one or two either round or flat) are hove on taut and snug, the end being at the side of the fellow part. The dead-eye is put in and the eye driven down with a commander.

Turning in a Dead-Eye end up (fig. 21).—The shroud is measured round the dead-eye and marked where a throat-seizing is hove on; the dead-eye is then forced into its place, or it may be put in first. The end beyond *a* is taken up taut and secured with a round seizing; higher still the end is secured by another seizing. As it is important that the lay should always be kept in the rope as much as possible, these eyes should be formed conformably, either right-handed or left-handed. It is easily seen which way a rope would naturally kink by putting a little extra twist into it. A shroud whose dead-eye is turned in end up will bear a fairer strain, but is more dependent on the seizings; the under turns of the throat are the first to break and the others the first to slip. With the cutter-stay fashion the standing part of the shroud gives way under the nip of the eye. A rope will afford the greatest resistance to strain when secured round large thimbles with a straight end and a sufficient number of flat or racking seizings. To splice shrouds round dead-eyes is objectionable on account of opening the strands and admitting water, thus hastening decay. In small vessels, especially yachts, it is admissible on the score of neatness; in

that case a round seizing is placed between the dead-eye and the splice. The dead-eyes should be in diameter $1\frac{1}{2}$ times the circumference of a hemp shroud and thrice that of wire; the lanyard should be half the nominal size of hemp and the same size as wire: thus, hemp-shroud 12 inches, wire 6 inches, dead-eye 18, lanyard 6 inches.

Short Splice.—The most common description of splice is when a rope is lengthened by another of the same size, or nearly so. Fig. 22 represents a splice of this kind: the strands have been unlaid, married, and passed through with the assistance of a marling-spike, over one strand and under the next, twice each way. The ends are then cut off close. To render the splice neater the strands

Fig. 22.—Short Splice.

should have been halved before turning them in a second time, the upper half of each strand only being turned in; then all are cut off smooth. **Eye-Splice.**—Unlay the strands and place them upon the same rope spread at such a distance as to give the size of the eye; enter the centre strand (unlaid) under a strand of the rope (as above) and the other two in a similar manner on their respective sides of the first; taper each end and pass them through again. If neatness is desired, reduce the ends and pass them through once more; cut off smooth and serve the part disturbed tightly with suitable hard line. Uses too numerous to mention. **Cut Splice.**—Made in a similar manner to an eye-splice, but of two pieces of rope, therefore with two splices. Used for mast-head pendants, jib-guys, breast backstays, and even odd shrouds, to keep the eyes of the rigging lower by one part. It is not so strong as two separate eyes.

Horse-Shoe Splice.—Made similar to the above, but one part much shorter than the other, or another piece of rope is spliced across an eye, forming a horse-shoe with two long legs. Used for back-ropes on dolphin striker, backstays (one on each side), and cutter's runner pendants. **Long Splice.**—The strands must be unlaid about three times as much as for a short splice and married, care being taken to preserve the lay or shape of each. Unlay one of the strands still further and follow up the vacant space with the corresponding strand of the other part, fitting it firmly into the rope till only a few inches remain. Treat the other side in a similar manner. There will then appear two long strands in the centre and a long and a short one on each side. The splice is practically divided into three distinct parts; at each the strands are divided and the corresponding halves knotted (as shown on the top of fig. 24) and turned in twice. The half strand may, if desired, be still further reduced before the halves are turned in for the second time. This and all other splices should be well stretched and hammered into shape before the ends are cut off. The long splice alone is adapted to running ropes.

Shroud Knot (fig. 23).—Pass a stop at such distance from each end of the broken shroud as to afford sufficient length of strands, when it is unlaid, to form a single wall knot on each side after the parts have been married; it will then appear as represented in the figure, the strands having been well tarred and hove taut separately. The part *a* provides the knot on the opposite side and the ends *b*, *c*; the part *c* provides the knot and the ends *d*, *e*. After the knot has been well stretched the ends are tapered, laid smoothly between the strands of the shroud, and firmly served over. This knot is used when shrouds or stays are broken. **French Shroud Knot.**—Marry the parts with a similar amount of end as before; stop one set of strands taut up on the shroud (to keep the parts together); and turn the ends back on their own part, forming bights. Make a single wall knot with the other three strands round the said bights and shroud; haul the knot taut first and stretch the whole; then heave down the bights close: it will look like the ordinary shroud knot. It is very liable to slip. If the ends by which the wall knot are made after being hove were passed through the bights, it would make the knot stronger. The ends would be tapered and served.

Fig. 23.—Shroud Knot.

Flemish Eye (fig. 24).—Secure a spar or toggle twice the circumference of the rope intended to be rove through the eye; unlay the rope which is to form the eye about three times its circumference, at which part place a strong whipping. Point the rope vertically under the eye, and bind it taut up by the core if it is four-stranded rope, otherwise by a few yarns. While doing so, arrange six or twelve pieces of spun-yarn at equal distances on the wood and exactly halve the number of yarns that have been unlaid. If it is a small rope, select two or three yarns from each side near the centre; cross them over the top at *a*; and half knot them tightly. So continue till all are expended and drawn down tightly on the opposite side to that from which they came, being thoroughly intermixed. Tie the pieces of spun-yarn which were placed under the eye tightly round various parts to keep the eye in shape when taken off the spar, till they are replaced by turns of marline hove on as taut as possible, the hitches forming a central line outside the eye. Heave on a good seizing of spun-yarn close below the spar and another between six and twelve inches below the first; it may then be parcelled and served; the eye is served over twice, and well tarred each time. As large ropes are composed of so many yarns, a greater number must be knotted over the toggle each time; a 4-inch rope has 182 yarns, which would require 22 knottings of six each time; a 10-inch rope has 834 yarns, therefore, if ten are taken from each side every time, about twice that number of hitches will be required; sometimes only half the yarns are hitched, the others being merely passed over. The chief use of these eyes has been to form the collars of stays, the whole stay in each case having to be rove through it,—a very inconvenient device. It is almost superseded for that purpose by a leg spliced in the stay and lashing eyes abaft the mast, for which it is commonly used at present. This eye is not always called by the same name, but the weight of evidence is in favour of calling it a Flemish eye. **Ropemaker's Eye**, which also has alternative names, is formed by taking out of a rope one strand longer by 6 inches or a foot than the required eye, then placing the ends of the two strands a similar distance below the disturbance of the one strand, that is, at the size of the eye; the single strand is led back through the vacant space it left till it arrives at the neck of the eye, with a similar length of spare end to the other two strands. They are all seized together, scraped, tapered, married, and served. The principal merit is neatness.

Fig. 24.—Flemish Eye.

Moose on a Stay.—Formed by turns of coarse spun-yarn hove taut round the stay, over parceling at the requisite distance from the eye to form the collar; assistance is given by a padding of short yarns distributed equally round the

rope, which, after being firmly secured, especially at what is to be the under part, are turned back over the first layer and seized down again, thus making a shoulder; sometimes it is formed with parceling only. In either case it is finished by marling, followed by serving or grafting. The use is to prevent the Flemish eye in the end of the stay from slipping up any farther.

Rolling Hitch (fig. 25).—Two round turns are taken round a spar or large rope in the direction in which it is to be hauled and one half-hitch on the other side of the hauling part. This is very useful, as it can be put on and off quickly.

Fig. 25.—Rolling Hitch.

Round Seizing (fig. 26).—So named when the rope it secures does not cross another and there are three sets of turns. The size of the seizing line is about one-sixth (nominal) that of the ropes to be secured, but varies according to the number of turns to be taken. An eye is spliced in the line and the end rove through it, embracing both parts. If either part is to be spread open, commence farthest from that part; place tarred canvas under the seizing; pass the line round as many times (with much slack) as it is intended to have under-turns; and pass the end back through them all and through the eye. Secure the eye from rendering round by the ends of its splice; heave the turns on with a marling-spike (see fig. 8), perhaps seven or nine; haul the end through taut; and commence again the riding turns in the hollows of the first. If the end is not taken back through the eye but pushed up between the last two turns (as is sometimes recommended), the riders must be passed the opposite way in order to follow the direction of the under-turns, which are always one more in number than the riders. When the riders are complete, the end is forced between the last lower turns and two cross turns are taken, the end coming up where it went down, when a wall knot is made with the strands and the ends cut close; or the end may be taken once round the shroud. **Throat Seizing.**—Two ropes or parts of ropes are laid on each other parallel and receive a seizing similar to that shown in fig. 21,—that is, with upper and riding, but no cross turns. As the two parts of rope are intended to turn up at right angles to the direction in which they were secured, the seizing should be of stouter line and short, not exceeding seven lower and six riding turns. The end is better secured with a turn round the standing part. Used for turning in dead-eyes and variously. **Flat Seizing.**—Commenced similarly to the above, but it has neither riding nor cross turns.

Fig. 26.—Round Seizing.

Racking-Seizing (fig. 27).—A running eye having been spliced round one part of the rope, the line is passed entirely round the other part, crossed back round the first part, and so on for ten to twenty turns according to the expected strain, every turn being hove as tight as possible, after which round turns are passed to fill the spaces at the back of each rope, by taking the end *a* over both parts into the hollow at *b*, returning at *c*, and going over to *d*. When it reaches *e* a turn may be taken round that rope only, the end rove under it, and a half-hitch taken, which will form a clove hitch; knot the end and cut it close. When the shrouds are wire (which is half the size of hemp) and the end turned up round a dead-eye of any kind, wire-seizings are preferable. It appears very undesirable to have wire rigging combined with plates or screws for setting it up, as in case of accident—such as that of the mast going over the side, a shot or collision breaking the ironwork—the seamen are powerless.

Fig. 27.—Racking Seizing.

Diamond Knot (figs. 28, 29).—The rope must be unlaid as far as the centre if the knot is required there, and the strands handled with great care to keep the lay in them. Three bights are turned up as in fig. 28, and the end of *a* is taken over *b* and up to the bight *c*. The end of *b* is taken over *c* and up through *a*. The end of *c* is taken over *a* and through *b*. When hauled taut and the strands are laid up again it will appear as in fig. 29. Any number of knots may be made on the same rope. They were used on man-ropes, the foot-ropes on the jibboom, and similar places, where it was necessary to give a good hold for the hands or feet. Turk's heads are now generally used. **Double Diamond.**—Made by the ends of a single diamond following their own part till the knot is repeated. Used at the upper end of a side rope as an ornamental stopper-knot.

Figs. 28, 29.—Diamond Knot.

Strapping-Blocks.—There are various modes of securing blocks to ropes; the most simple is to splice an eye at the end of the rope a little longer than the block and pass a round seizing to keep it in place; such is the case with jib-pendants. As a general rule, the parts of a strop combined should possess greater strength than the parts of the fall which act against it. The shell of an ordinary block should be about three times the circumference of the rope which is to reeve through it, as a 9-inch block for a 3-inch rope; but small ropes require larger blocks in proportion, as a 4-inch block for a 1-inch rope. When the work to be done is very important the blocks are much larger; brace-blocks are more than five times the nominal size of the brace. Leading-blocks and sheaves in racks are generally smaller than the blocks through which the ropes pass farther

Fig. 30.—Grummet-Strop.

away, which appears to be a mistake, as more power is lost by friction. A stump-block should be double the nominal size of the rope. A single strop may be made by joining the ends of a rope of sufficient length to go round the block and thimble by a common short splice, which rests on the crown of the block (the opposite end to the thimble) and is stretched into place by a jigger; a strand is then passed twice round the space between the block and the thimble and have tant by a Spanish windlass to cramp the parts together ready for the reception of a small round seizing. The cramping or pinching into shape is sometimes done by machinery invented by a rigger in Portsmouth dockyard. The strop may be made the required length by a long splice, but it would not possess any advantage.

Grummet-Strop (fig. 30).—Made by unlaying a piece of rope of the desired size about a foot more than three times the length required for the strop. Place the centre of the rope round the block and thimble; mark with chalk where the parts cross; take one strand out of the rope; bring the two chalk marks together; and cross the strand in the lay on both sides, continuing round and round till the two ends meet the third time; they are then halved, and the upper halves half-knotted and passed over and under the next strands, exactly as one part of a long splice. A piece of worn or well-stretched rope will better retain its shape, upon which success entirely depends. The object is neatness, and if three or multiples of three strops are to be made it is economical.

Double Strop (fig. 31).—Made with one piece of rope, the splice being brought as usual to the crown of the block, *t*, the bights fitting into *a*-cores some inches apart, converging to the upper part, above which the thimble receives the bights *a*, *a*; and the four parts of the strap are secured at *s*, *s* by a round seizing, doubly crossed. If the block be not then on the right slew (the shell horizontal or vertical) a union thimble is used with another strop, which produces the desired effect; thus the fore and main brace-blocks, being very large and thin, are required (for appearance) to lie horizontally; a single strop round the yard vertically has a union thimble between it and the double strop round the block. The double strop is used for large blocks; it gives more support to the shell than the single strop and admits of smaller rope being used. Wire rope is much used for block-strops; the fitting is similar. Metal blocks are also used in fixed positions; durability is their chief recommendation. Great care should be taken that they do not chafe the ropes which pass by them as well as those which reeve through.

Servage Strop.—Twine, rope-yarn, or rope is warped round two or more pegs placed at the desired distance apart, till it assumes the requisite size and strength; the two ends are then knotted or spliced. Temporary firm seizings are applied in several places to bind the parts together before the rope or twine is removed from the pegs, after which it is marled with suitable material. A large strop should be warped round four or six pegs in order to give it the shape in which it is to be used. This description of strop is much stronger and more supple than rope of similar size. Twine strops (covered with duck) are used for boats' blocks and in similar places requiring neatness. Rope-yarn and spun-yarn strops are used for attaching luff-tackles to shrouds and for many similar purposes. To bring to a shroud or hawser the centre of the strop is passed round the rope and each part crossed three or four times before hooking the "luff"; a spun-yarn strop above the centre will prevent slipping and is very necessary with wire rope. As an instance of a large servage block-strop being used,—when the "Melville" was hove down at Chusan (China), the main-purchase-block was double stropped with a servage containing 28 parts of 3-inch rope; that would produce 112 parts in the neck, equal to a breaking strain of 280 tons, which is more than four parts of a 19-inch cable. The estimated strain it bore was 80 tons.

Stoppers for ordinary running ropes are made by splicing a piece of rope to a bolt or to a hook and thimble, unlaying 3 or 4 feet, tapering it by cutting away some of the yarns, and marling it down securely, with a good whipping also on the end. It is used by taking a half-hitch round the rope which is to be hauled upon, dogging the end up in the lay, and holding it by hand. The rope can come through it when hauled, but cannot go back.

Whipping and Pointing.—The end of every working rope should at least be whipped to prevent it fraying out; in ships of war and yachts they are invariably pointed. Whipping is done by placing the end of a piece of twine or knittle-stuff on a rope about an inch from the end, taking three or four turns taut over it (working towards the end); the twine is then laid on the rope again lengthways contrary to the first, leaving a slack bight of twine; and taut turns are repeatedly passed round the rope over the first end and over the bight, till there are in all six to ten turns; then haul the bight taut through between the turns and cut it close. To point a rope, place a good whipping a few inches from the end according to size; open out the end entirely; select all the outer yarns and twist them into knittles either singly or two or three together; scrape down; and taper the central part, marling it firmly. Turn every alternate knittle and secure the remainder down by a turn of twine or a smooth yarn hitched close up, which acts as the weft in weaving. The knittles are then reversed and another turn of the weft taken, and this is continued till far enough to look well. At the last turn the ends of the knittles which are laid back are led forward over and under the weft and hauled through tightly, making it present a circle of small bights, level with which the core is cut off smoothly. Hawser and large ropes have a becket formed in their ends during the process of pointing. A piece of 1 to 1½-inch rope about 1½ to 2 feet long is spliced into the core by each end while it is open; from four to seven yarns (equal to a strand) are taken at a time and twisted up; open the ends of the becket only sufficient to marry them close in; turn in the twisted yarns between the strands (as splicing) three times; and stop it above and below. Both ends are treated alike; when the pointing is completed a loop a few inches in length will protrude from the end of the rope, which is very useful for reeving it. A hauling line or reeving line should only be rove through the becket as a fair lead. **Crafting** is very similar to pointing and frequently done the whole length of a rope, as a side-rope. Pieces of white line more than double the length of the rope, sufficient in number to encircle it, are made up in hanks called foxes; the centre of each is made fast by twine and the weaving process continued as in pointing. Block-strops are sometimes so covered; but, as it causes decay, a small wove mat which can be taken off occasionally is preferable.

Sheep-Shank (fig. 32).—Formed by making a long bight in a top-gallant-back-

FIG. 32.—Sheep-Shank.

stay, or any rope which it is desirable to shorten, and taking a half-hitch near each bend, as at *a*, *a*. Rope-yarn stops at *b*, *b* are desirable to keep it in place

till the strain is brought on it. Wire rope cannot be so treated, and it is injurious to hemp rope that is large and stiff.

Knitting Yarns (fig. 33).—This operation becomes necessary when a comparatively short piece of junk is to be made into spun-yarn, or large rope into small, which is called twice laid. The end of each yarn is divided, rubbed smooth, and married (as for splicing). Two of the divided parts, as *c*, *c* and *d*, *d*, are passed in opposite directions round all the other parts and knotted. The ends *e* and *f* remain passive. The figure is drawn open, but the forks of *A* and *B* should be pressed close together, the knot hauled taut, and the ends cut off.

FIG. 33.—Knitting Yarns.

Butt Slings (fig. 34).—Made of 4-inch rope, each pair being 26 feet in length, with an eye spliced in one end, through which the other is rove before being placed over one end of the cask; the rope is then passed round the opposite side of the cask and two half-hitches made with the end, forming another running eye, both of which are beaten down taut as the tackle receives the weight. Slings for smaller casks requiring care should be of this description, though of smaller rope, as the cask cannot possibly slip out.

Bale Slings are made by splicing the ends of about 3 fathoms of 5-inch rope together, which then looks like a long strop, similar to the double strop represented in fig. 31,—the bights *t* being placed under the cask or bale and one of the bights *a*, *a* rove through the other and attached to the whip or tackle.

FIG. 34.—Butt Slings.

The marks on the lead-line are leather at 2, 3, and 10 fathoms, white at 5 and 15, red at 7 and 17, and blue at 18. The length of the lead is not usually included. The deep-sea line commences with 2 knots at 20, another knot being added for every 10 fathoms, and a single knot at each intermediate 5. Log-lines should have ample stray line (distance between the log-ship and the first mark). The distance of 47 feet and a 28-second-glass were adopted to assimilate the sea furlong to the shore furlong, which was absurd. Fifty feet to half a minute would be more correct and more convenient.

Since space will not allow of a full description of masting and Masting. rigging, only a few of the more important points will be noticed. The masts must be stepped before they are rigged; accordingly we will first describe the manner in which they are put on board in cases where the assistance of shears on hulk or jetty is not available; at an out-port a seaman is still left to his own resources, just as he was in former times. Fixing the masts in a large frigate, such as that shown in fig. 35 below, is a serious consideration, as the mainmast weighs about twenty tons.

Two suitable spars must be procured about three-fourths the length of the main-mast and about two-thirds its diameter,—the greater the housing the higher the shears. They are towed alongside or under the stern with the thicker ends forward, and par-buckled over the side or hoisted in through the stern-ports by means of a derrick, whichever is most convenient. The smaller ends are rested upon a spar across the gunnel or the break of the poop, crossed, and lashed with strong well-stretched rope (about 4½ or 5 inches) passed figure-of-eight fashion, commencing at the centre, returning with riding turns as a racking seizing, and crossed again; the turns at the extreme ends should not be so taut as the others. Care must be taken to place the seizing equidistant from each heel after they have been trimmed to fit flat upon shoes of strong oak planking; they will remain within their full spread by about 2 feet each side till after the head seizing has been secured. Lash a threefold purchase-block to the horns above the lashings, to hang down clear under the cross, so as to correspond with a twofold block to be lashed to the mast. If such blocks cannot be procured two top-blocks may be substituted for the upper block and one on the mast, reserving the fourth top-block as a lead secured to one of the shear legs or near it.¹ Two purchases may be used at the same time with advantage, one block hanging on the fore, the other on the after side. A gird-line is also placed on the highest part of the horns to assist in canting the mast, and another for the purpose of hoisting up a man should anything require alteration. The lashing at the shear-head must be well protected with old canvas and all the decks must be shored up in the vicinity of the places where the shear-legs stand for each mast. The legs must be lashed together at the desired spread and heel tackles led forward and aft from each. To form the four head-guys the central parts of two hawsers are clove-hitched above the lashing and spread as far as is convenient in four directions and set up by tackles. When all is ready and the purchase rove, the lower block should be secured forward as high as can be; and, while the purchase is being hove upon, a light derrick or small shears lifting the shear-head will greatly assist; of course the after heel tackles must be well secured. After the shears are erect and the heels cleated and lashed to the shoes they can be scuffed about by the heel tackles and guys to any desired position,—the hole for the mizzen-mast is first plumbed.

The mizzen-mast should be brought alongside with its head aft, and a sufficiently strong servage strop lashed on the fore side if it

¹ Top-blocks in large ships are 26 inches, carrying 94-inch rope, the breaking strain of which is 25 tons; by taking the standing part down to the mast there are three parts lifting, equal to 75 tons,—a sufficient margin over 20 tons. Twenty-two-inch blocks and an 8-inch rope would break at 54 tons. Large ships have one 26-inch and one 24-inch double block for jears, which would reeve an 8-inch rope. The size of a block implies the length of the shell, of a rope its circumference, and of a chain cable the diameter of the iron.

is to be lifted by one purchase, and one on each side if two are used, and as high up as the shears will allow, the limit being from heel to lashing 6 or 8 feet less than from the lower side of the purchase-block to the deck. Old spars having been hung over the side for the mast to rub against and the purchase fall taken round the capstan, the mast is hove up till the head comes above the gunnel; then two single blocks with long-tailed strops are secured round it with the gird-lines of about 4 inches and twice the length of the mast ready rove. The trestle-trees

are now usually bolted on in the mast-house. The gird-line from the shear-head must be bent to the head of the mast at a suitable height to act as a topping-lift. As the mast is hove up by the capstan a stout rope from out-board must be timber-hitched round the heel so as to ease it in as it clears the gunnel, and to haul it towards the partners (mast-hole); when it has been lowered to within 2 feet of the step, a slow rope is passed three times round the mast and a "cat's-paw" formed on each side, through the eyes of which a capstan bar is passed ready to heave either way as

FIG. 35.—The spars and rigging of a frigate. 1, the bowsprit; 2, bobstays, three pairs; 3, sprit-sail-gaffs, projecting on each side of the bowsprit,—the ropes at the extremities are jib-guys and flying-jib-guys; 4, jibboom; 5, martingale-stay, and below it the flying-jib-martingale; 6, back-ropes; 7, flying-jibboom; 8, fore-royal-stay, flying-jib-stay, and halyards; 9, fore-top-gallant-stay, jib-stay, and halyards; 10, two fore-top-mast-stays and fore-top-mast stay-sail halyards; 11, the fore-top-bowlines, stopped into the top and two fore-stays; 12, two fore-tacks; 13, fore-truck; 14, fore-royal-mast, yard, and lift; 15, top-gallant-mast, yard, and lift; 16, fore-top-mast, top-sail-yard, lift, and reef-tackle; 17, fore-top, fore-lift, and top-sail-sheet; 18, fore-mast and fore-shrouds, nine pairs; 19, fore-sheets; 20, fore-gaff; 21, fore-top-mast back-stays and top-sail-tye; 22, royal and top-gallant back-stays; 23, fore-royal-braces and main-royal-stay; 24, fore-top-gallant-braces and main-top-gallant-stay; 25, standing parts or fore-top-sail-braces and main-top-mast-stays; 26, hauling parts of fore-top-sail-braces and main-top-bowlines; 27, four parts of fore-braces; 28, royal-stays; 29, main-tacks; 30, main-truck; 31, main-royal-braces; 32, mizzen-royal-stay and mizzen-royal-braces; 33, main-top-gallant-braces and mizzen-top-gallant-braces; 34, standing parts of main-top-sail-braces and mizzen-top-mast-stay; 35, mizzen-top-sail-braces; 36, hauling parts of main-top-sail-braces, mizzen-top-bowlines, and cross-jack-braces; 37, main-braces and mizzen-stay; 38, standing part of peak halyards; 39, vangs, similar on each gaff; 40, ensign staff; 41, spanker-boom; 42, quarter-boat's davits; 43, one of the davit topping-lifts and wind-sail; 44, main-yard-tackle; 45, a bull-rope.

required; in the meantime both the heel of the mast and the step should be well coated with white lead or coal-tar. Lower and slew according to directions from below; when the mast is stepped and brought to the desired position, place four temporary wedges, rig a triangle, trice it up by the gird-lines, unlash the purchase or strops, overhaul down, unrig the triangle, and haul the gird-lines taut on each side.

The shears can be transported forward in nearly an upright position by first pulling the heel-tackles and then the guys, shifting the guys forward one at a time as necessary. The main-mast and the fore-mast are taken in in the same way as the mizzen-mast, described above,—all three abaft the shears; but, being much longer, they require greater hoist and greater care generally.

To take in the bowsprit the shears are again moved forward, all the heel-tackles being led forward and extra lashings placed on the heels. A purchase nearly as strong as that to be used in lifting the bowsprit should be secured between the fore-mast-head and the shear-head, or two parts of a stout hawser may be used, the middle being clove-hitched over the horns and the ends taken round beams well aft on either side, ready for veering as the shears are drooped (to an angle of about 45°), then to act as the principal support; the fore-guys are also taken aft to assist. The fore-mast must be wedged on both decks and one or more tackles used to keep the head aft. The bowsprit cap is invariably bolted on in the mast-house; the bowsprit is then brought under the bows with the cap end forward and slung for the main purchase a little

outside the housing, which is generally about two-fifths of the whole length. The main purchase should plumb nearly the length of the housing outside the bows, and the higher the shear-head the greater the freedom of motion. The outer purchase attached to a strop through the hole in the cap and the guys from the cap to each cat-head alike tend to force in the bowsprit when it is high enough; besides this, a heel rope is put round it before it leaves the water, and a strop with a tackle to the bitts is used to bowse it into the hole and mortise. It is hoisted to about an angle of 45° before the heel is entered. A rough sketch made to scale will greatly facilitate such operations and ensure success. When a bowsprit is put in by shears on a hulk or jetty, it is hoisted up ahead of the ship nearly horizontal, or at the angle (steeve) which it is intended to assume, and the ship is moved ahead towards it, till the bowsprit enters in the desired position.

The directions for masting a large ship are more than sufficient for masting a small one, which is so much easier.

Gammoning the bowsprit is the most important point in rigging a ship, as the stays of the fore-mast and main-top-mast depend for security on the bowsprit. In large ships there are two distinct lashings (of either new stretched rope or chain) to keep the bowsprit down; they are passed in a similar manner over a long saddle-shaped piece of wood called a gammoning fish and through the holes in the head knees, the outer one first. One end is clinched or shackled round the bowsprit over the fore-part of the hole; the

1 References are not repeated for each mast where the names and functions are identical.

other, being rove through the after-part of the hole, comes up on the aft side of the first turn on the bowsprit and down inside that part and before the turns in the hole, thus forming a double cross with the first turns outside. Every turn is set up as passed by means of a pendant through the hawse-pipe or bow-port, and a block is secured to the hole for the bobstays, which are attached to the gammoning by a selvagee or toggle, and held while the next turn is being passed by a racking seizing if rope and by nails driven through the links into the fish if chain. When the hole is full of turns—eight or ten—the whole is frapped together as tightly as possible, commencing at the lower part.

The clothing of a bowsprit of a large ship consists of nine strops for its own security and the fore-stays. A bobstay collar is hove on at one-third the distance between the night-heads and the outer extremity, and close outside it two bowsprit shroud collars and a fore-stay collar, then the second bobstay collar, two bowsprit shroud collars, another fore-stay collar, and the third bobstay collar; in addition to these there is a cap bobstay, which sets up to a bolt close inside the bowsprit cap. The bobstay and bowsprit shroud collars are hove on at right angles to the spar and usually cleated in that position. But this cleating is a mistake; as the strain comes upon each of them very obliquely, it is necessary that they should yield in that direction before the cleats are nailed, or they will give way and slacken the rope when it is most required to be taut. Bobstays are cut to the required length, wormed and parcelled from the centre towards the ends, and served; they are rove through their respective holes in the cutwater before being spliced, which splice is tapered, parcelled, and served over, and rests on the head of the heart when it is seized in. The bobstays and bowsprit shrouds are set up by lanyards half the nominal size if rope and the same size if wire; the standing parts are secured by running eyes round the necks of the collars confining the hearts, and are set up by two luffs, one acting upon the other.

Getting
up tops.

The cross-trees are swayed up one at a time by the two gird-lines, whose united action and a guy on deck conduct them to their places, where they drop into recesses and are bolted to the trestle-trees. When a whole top is to be got up it is placed abaft the mast (except the mizzen) with the lower side forward and the fore part uppermost; the gird-lines are passed under it, that is, before it, each being rove up through the second hole from aft for the futtock-plates and hitched tightly to its own part as it passes the lubber's hole, which part is also stopped to the hole at the fore part of the top. If it be a large top each gird-line may be taken down the fore (under) side (as before), rove up through the after-hole for the futtock-plate, down through the lubber's hole, taut up through the foremost hole, and hitched to the hoisting part, which is stopped firmly to the fore part, where a gird-line leading from the mast abaft is also stopped after the end has been made fast to the centre hole for the top-rail; that gird-line is to keep the top clear of the trestle-trees as it goes up and to assist in placing it. There are several slightly different ways of slinging a whole top; but in all cases the gird-line blocks (after the stop is cut) hoist the fore part higher than themselves, till it falls over them and hangs as nearly horizontal as could be judged in slinging it. The final adjustment of it in its place is done by hand, and then it is bolted to the cross-trees. The mizzen-top is put over either in a similar manner with a guy to the taffrail or sent up before the mast with the after part uppermost, a gird-line from the main-mast-head keeping it clear of the trestle-trees, which project much farther on the fore side. Tops are taken off by the reverse process; but it is more difficult to get the hole back over the mast-head.

Tops are now very seldom made in one part, but in two halves, which is more convenient and equally serviceable. Each half is sent up in a similar manner to the whole top; the gird-lines are bent on precisely the same way, but one half at a time, which falls square at the side of the mast when the stop is cut instead of going over the top of the mast. After the top is bolted, it is advisable to hoist up the lower cap into the top while the whole space of the lubber's hole is still free, but not to put it on till after the lower rigging is fixed. The cap being placed near the mast with the bolts downwards and the hole for the top-mast forward, both gird-lines are brought down through the lubber's hole on the same side; that which crossed before the mast is bent on to the fore part of the cap, and that which belongs to the side on which the cap is lying is made to sling the after part fairly and is then stopped to the fore part, so that this last is hoisted up by both gird-lines end on till in the top, when, the stop at the fore end being cut, the cap hangs in front of the mast and the round hole can be placed exactly over the space between the trestle-trees where the top-mast will come up. A soft piece of wood called a "bolster" is made to fit into the angle formed by the trestle-tree and the mast on each side, and is bolted in place so as to present a smooth rounded surface along the whole distance required for the rigging to rest upon, and is covered by a padding of tarred canvas five or six parts thick, secured by a row of flat-headed nails along the upper side. Each mast is similarly provided.

Preparatory to sending up the lower rigging on the masts it is

necessary to rearrange the gird-lines, as it is obviously inconvenient Lower to hoist the eye of a shroud over the mast and allow it to fall down rigging over both parts of a heavy rope which would require to be hauled up from the deck or rove every time; therefore they are lashed to the leads in the trestle-trees for the truss falls, and a small gird-line is lashed high up abaft the mast to be worked in the top for both sets of rigging. The starboard tackle-pendant is put over first, then the port pair, next the starboard foremost pair of shrouds followed by the port pair, and so on alternately till all the shrouds are in place, ending with an odd one called a swifter on each side. Large ships have four pairs of shrouds and a swifter on each side. They are all sent up in a similar manner: the large gird-line from the trestle-tree is secured to the pendant at the extremity and to the shrouds more than the length of the mast-head below the seizing by means of a strop with a slip-rope, toggle, and down-haul; the eye is opened to the shape of the mast-head and the after-port is stopped to the gird-line, which sways it up to the lubber's hole, when the men in the top bend the eye in the direction it is to go over the mast and make fast their small gird-line a fathom or two below the seizing, with a stop on the after part of the eye, which is cut when the pendant or shroud is fair for going over the mast-head. When the shroud is over, each eye is hardened down by a large mallet called a "commander." Ropes should be rove through the thimbles of the pendants and hauled taut when they are being driven down; then the "up-and-down" tackles should be hooked to the short legs (which are forward), while the long legs are being lashed abaft the mast and the runner-blocks lashed to them for staying the mast by the runners. As each pair of shrouds are put over, they should be temporarily set up by the dead-eyes and lanyards, or by a luff-tackle on each, to prevent their springing up before another pair presses upon them. It is of very great importance to keep each eye taut before others press on it both for preservation and appearance; many an eye has been stripped of its service and parcelling through slipping out from under the weight. A piece of rounding made fast to a bolt in the hounds of the mast with an eye in the other end is very useful for keeping the back of the eye down while it is being made taut, by reeving the short eye end up through the eye of the shroud and hooking a burton from the deck to it, which is pulled upon at the same time that the shroud is set up on the other side of the ship; when finished, that piece of rope will be jammed. The lower stays, after they have been completely fitted and the hearts have been turned in, are stopped together one over the other at the fork of the collar, at the sides, and at the eyes. The gird-lines, having been put back to the mast-head, are sent down through the lubber's hole, one crossing the fore side of the mast, and are bent to both stays below the fork of collars and stopped to the eyes; they are thus swayed up near their places, the respective eyes being lashed together by rose-lashings low down over the eyes of all the shrouds. The hearts are then carried forward, the fore to the hearts in collars round the bowsprit and the main to hearts provided for the purpose near the fore-partners, while the collars of the stays are suspended from the fore-part of the top, the collars being eased down as required to preserve a straight line between the lashing-eyes and the point where the stay is set up.

The following is the method employed to set up the rigging on Setting the masts. It is first drawn forward by the runners and tackles up stays. (lashed to the long legs of mast-head pendants, which are lashed together abaft the mast) till brought before the position it is intended to stand in, as the strain of the shrouds will draw it aft. Many seamen recommend, with reason, that a strain should be brought on the after-swifters while it is being stayed, to keep it more firm. The propriety of wedging the mast before the rigging is set up may be considered an open question; it was considered lubberly forty years ago, but is now the common practice. The lanyards of the stays are in proportion smaller than those of the shrouds, since many more turns can be passed through hearts than through dead-eyes. The standing parts are made fast round the collar or strop of the lower heart by a running eye; the end is rove up through the heart in the stay and down through the lower one twice and the slack hauled through by the sail-tackle, which must be previously secured for that purpose round the lower mast-head and hung over the fore-part of the top; or the two top-burtons may be used, one for each stay. When the slack of the lanyard is through and racked, the double block of a luff-tackle is attached by turning the bight back over a toggle or glut, as slings are represented in fig. 18. Then a selvagee strop is passed twice round both parts below the bight *s* (when the figure is turned up), brought up on the side of the arrow, and hooked to the luff. A cat's-paw, as shown in fig. 7, may be used with a glut placed at *g* to keep the parts open, otherwise a large rope would be injured. The single block of the luff is secured to the stay as high up as it will reach by a long double-tailed selvagee, which is dogged softly at first, but terminates with close-taut turns and a spun-yarn seizing. Care must be taken to prevent kinking the rope, especially if it is wire; if hemp, it should be parrelled to protect the outer yarns. The fall of the luff is connected with the

sail-tackle (by one of the means described) and the sail-tackle fall led in the direction of the stay; it is pulled up steadily, the nips of the lanyards having been well tarred to make them slip through the hearts, while they are also shaken up by levers. When taut enough the lanyard is securely seized to the next part, another turn rove, set up, and seized, till the scores in the hearts are full; then riding turns are taken. Whilst the first riding turn still bears the strain, all the seizings on the lanyards should be cut off, and others put on when each part has taken over an equal strain. After the riding turns are completed, the end of the lanyard is secured by a clove-hitch and a seizing. Where there is not a sail-tackle a long luff may be used in a similar manner, the double block being secured above the single block of the other luff. It is desirable that both stays on the masts should be set up at the same time, but it is not imperative; care should be taken that they are equally taut.

Lan-yards. A lanyard for rigging with dead-eyes is half the nominal size of rope shrouds and the same size as wire rigging. The knot is inside under the end of the shroud, or is first spliced to a bolt in the chains and then rove through that hole; it is rove full before commencing to set up. The mast having been stayed, luffs are placed on the shrouds with the double block down and brought to the lanyard as above described; the up-and-down tackle from the mast-head pendant is secured to the fall of the luff by a cat's-paw and strop and pulled up till taut enough, the foremost shroud on the starboard side first, then that on the port side, and so on alternately till they are all nearly taut alike (the after-swifters not quite so taut as the others), which is best ascertained by an experienced man shaking them; if the dead-eyes are not square (even) when finished, it is far better to turn them in afresh than to have an unequal strain on the shrouds. If a pair of shrouds were set up at the same time it would be better for the eye and the seizing. Tar should be used freely on the lanyards as they enter the dead-eyes, whether they are of iron or wood; it causes them to slip quite as well as grease and preserves the rope, while grease causes it to decay. The lanyards are seized to the next part till a clove hitch is taken above the dead-eye and the end seized down; the parts of the lanyard should then be made to bear an equal strain, and afterwards seized together lest any part should be injured. The runners should be kept taut till everything is secured, then eased up gently, to avoid straining the mast. Lower masts generally have an inclination to belly,—i.e., bend aft. Space will not admit of details being given as to the various parts of the rigging; the main principles follow the lines of that which has been already rather fully described above. The top-mast stays and rigging are set up by means of top-burtons and jiggers, the top-gallant-rigging and that of all small vessels by jiggers and light appliances.

Lower cap and top-mast. The lower caps were supposed to have been swayed up by the gird-lines and placed in position to receive the top-masts before the lower rigging was put over. To fix one of them in its place, let a top-block be hoisted up lashed to the mast-head close below the square on which the cap is to rest, on the side suitable to the sheave in the top-mast; through the block reeve a suitable hawser (9 inches for a large ship); send the fore end down through the square hole between the trestle-trees; lay it along the top-mast (the spare one if allowed two); reeve it through the live sheave in the heel; and hitch it round the head of the top-mast and hawser, leaving considerable end; also place a good lashing round the mast-head and the hoisting-part of the hawser and seize the two parts of the hawser together about half-way up, strong enough to bear the weight of the mast. If the top-mast be much longer than the space between the deck and the trestle-tree, the lashing must be placed low enough from the head of the mast to allow it, while suspended, to project above the top outside, while the heel is guided down the main hatchway or fore-scuttle. The capstan is used to heave the mast up; when it is pointed between the trestle-trees, remove the lashing round the head, and if landed—i.e., resting its weight on the deck—make the end of the hawser fast round the mast-head, the hitch being on the side opposite to the block, and cast off the racking lashing, leaving the mast ready to be hove up by the two parts of the hawser. If not landed, heave up 3 or 4 feet before securing the end of the hawser, so that, when that has been done and well seized, the capstan may be moved back till both parts bear an equal strain; the racking can then be taken off without fear of a jerk. After the head of the top-mast has been hove 3 or 4 feet through the hole in the cap, it is securely lashed, commencing with a clove-hitch round the mast, the ends being passed through the bolts under the cap on one side and repeated on the other, so that it will be sure to hang horizontally. Heave round the capstan till the cap is above the lower mast-head; then steer it by means of a handspike or capstan bar in the fid-hole, while men in the top direct the head of the top-mast by handspikes, till the hole in the cap is exactly over the square of the mast, when by moving back the capstan and beating the cap down with a commander it will fit firmly in its place.

If the heel of the top-mast rests on the deck before the head

is free from the trestle-trees, it is as well to lower it down to that position; but, if it is too short to rest there, the up-and-down tackles must be used to suspend it by strops through the fid-hole, while the top-block is being unlashed and hooked to the after-bolt fixed for that purpose in the cap and the end of the hawser secured to the foremost bolt on the opposite side. In large ships a shore is placed under the fore-part of the cap to support the weight and resist a possible blow from the top-sail-yard. The top-mast may now (unless it is blowing hard) be swayed right up and fidded to prove that it will fit when required (an allowance being made for the wood swelling with wet), and sent on deck in exchange for the other mast, which when swayed above the lower cap will have a gird-line lashed round the head and then be raised 15 or 20 feet more. One part of the gird-line should be sent down abaft all and bent on to the fore-part of the top-mast cross-trees; by this, assisted by a guy, they can be swayed up till above the lower cap, upon which the after-part will rest, securely lashed to the bolts to prevent it slipping, while the fore-part will lean against the top-mast at such a distance as to ensure it falling in the right position when the top-mast is lowered and to receive the head of the mast between the trestle-trees as it is swayed up again to a convenient position for receiving the rigging. The rigging is swayed up by gird-lines on the cross-trees, and put over in a similar manner to the lower rigging, the top-burton pendants first, then the shrouds and backstays in succession, and the stays are lashed.

There is usually a chain necklace round each top-mast-head, sunk in the bolsters; one leg of each is for the top-sail-tye hanging-block to shackle to, and forward there are two other legs for the jib-halyards and fore-top-mast stay-sail-halyards. After the rigging has been placed over the top-mast-head, the cap is sent up by two gird-lines lashed as high as possible and bent to the foremost part of the cap, with stops to the after-bolts, by which means it goes up before all, with the under-side towards the mast; when it is high enough the after-stops are cut and it slides up on the top of the mast, assisted by men at the mast-head, who get it over the square and beat it down. Directly the top-mast is in position to receive the rigging the top-rope pendants are rove and the tackles secured, first one to relieve the hawser of the weight and then the other in its place. Copper funnels are sometimes used to receive the top-mast rigging, similar to those for top-gallant-masts.

Top-gallant and royal rigging is sometimes stripped of the service Top-gal- and covered with canvas, which is afterwards painted, for the sake of neatness; but the durability of the rope is thereby greatly royal rig- lessened. Another bad practice is that of taking off one of the top-gal- gallant-backstays, thereby directly diminishing the support. But worse still is the trick of forming the eyes of rigging and backstays by two seizings, the ends of each rope going to different sides of the ship; this gives two eyes over the mast instead of four, and makes everything depend on the strength of the seizings. It is now a very common practice to cross the top-gallant rigging and set it up on opposite sides of the top, instead of reeving it through the necklace on the top-mast and setting it up on the same side. This is done entirely for the sake of saving seconds in shifting the spars, either the top-gallant-mast or the top-mast. Shrouds so treated give no support to the mast whatever; probably they act in the reverse way, as may be easily shown by drawing a straight line to represent the masts when standing upright and lines in rough proportion at right angles for the top and cross-trees. Draw the top-gallant rigging on one side from mast to cross-tree and thence to the opposite side of the top. The top-mast, having a little play in the cap and at the heel, is bound to go over some inches at the head, taking the cross-tree with it; it will then be seen that the weather side of the cross-tree has approached the lee side of the top, slacking the weather and tightening the lee top-gallant rigging.

Getting a lower yard on board requires great care to avoid injury Lower to the hammock netting and other things. Spars should be slung yards. over the side for it to rub against and slip-ropes through the ports to ease it over the gunnel. If it is to be hoisted in on the port-side, the starboard yard-arm is towed foremost. A hawser may be rove through the port top-block down through the lubber's hole and bent round the centre of the yard. The hatch of the lubber's hole must be open and a strong mat provided. Instead of the hawser the jeers may be partially rove, the standing part being secured to the yard, and also the sail-tackle from the top-mast-head to the lower yard-arm and the starboard up-and-down tackle to the starboard yard-arm, also a burton from the fore-mast to the main-yard, or from the bowsprit if it is a fore-yard. The capstan and jeers will heave up the bulk of the weight, while the other tackles cant it and ease it across the gunnel. A derrick is sometimes used to keep it off the ship's side. When a ship is alongside a jetty, a guy from a strong-hold on shore removes all difficulty, and a list towards the side at which the yard is coming in is desirable. Lower yards are usually rigged while resting across the gunnel; they are swayed up by the jeers, and slung with strong chains—the part round the yard being connected with that round the lower mast-head by a tongue and slip. The yards must be

prevented from canting forward with the weight and drag of the sail; accordingly the slings, either chain or rope, should be put on with the bight coming up the fore side (see fig. 18, where the arrow indicates the fore side and the direction the sail pulls); they are generally put on the wrong way. Merchant ships are invariably fitted with iron trusses, which are fixtures on the mast, holding the yard at the requisite distance and acting as a universal joint. They are of great advantage where there is not a large crew.

Trim and stowage. While the rigging is progressing the disposition of all heavy weights is worthy of serious attention; for not only ought the vessel to be brought to the draught and trim designed by the builder, or that which has by experience been found the best, but there must not be too much strain at any one part, especially the extremities. In ships intended for sailing or steaming rapidly this is of vital importance; the bows and sterns of cutter or schooner yachts should be empty. Placing the weights in the wings of the hold will steady the rolling motion and make the intervals longer; but this may be carried too far for stability,—especially if the vessel has a low free-board. Weights low down close to the keel will increase stability at the expense of a quick uneasy jerking motion. A yacht which carries much ballast low down will be very stiff under canvas and may sail well in the Solent, but would be unfit to go outside the Isle of Wight. When heavy weights are carried in merchant ships as part cargo, they should never be placed as a solid mass; railway bars, for instance, may be stowed gridiron fashion a foot apart, by which means they will occupy as much space and act upon the ship in the same way as an equal weight of provision casks.

Bending sails. Before bending sails all the ropes are rove ready for use. A yacht's sails if new should be scrubbed, to take the stiffness out of them. In all cases they should be set when bent and the yards braced each way (unless it is blowing too hard), or there is a risk of something going wrong when they are required for use. In setting them care should be taken that no part is stretched or girt unduly.

Cable. The inner end of a chain cable is usually secured by a tongue-slip and by a short piece of cable which passes round the mast or is shackled to the keelson; it still retains the name of "clinch." The tongue should not have scope enough to reach the compressor, as it has been known to strip back the ring and slip the cable. It is a good thing to trice up the slip before the cable is stowed, so that it will be accessible at all times, either for slipping, shackling another cable, or bending a hawser. It may be thought that a chain cable would run into the locker and stow itself, but that is a mistake; if care is not taken to spread it evenly, it will form a pyramid with turns round the base, upon which the upper part will fall as soon as the ship leans over; it will then be necessary to haul up several small bights before the cable will run clear.

Single anchor. A ship should never lie long at single anchor in a tide-way or during variable winds, for fear of fouling her anchor and thereby destroying its holding power. Frequently space is wanted, as ship and cable range over a large circle, with liability to foul other ships or their anchors. A long scope of cable will only keep a ship clear of her anchor during very light winds, unless assisted by close attention and correct judgment on the part of the seaman. The direction of the two streams of tide should be considered in connexion with the wind in order to keep the ship to leeward of her anchor each time she passes it. A strong wind blowing across the direction of the tide and acting on the hull of the ship will secure that effect; but, when the directions of wind and tide are the same or nearly so, precaution is necessary at each turn of the tide; it is then that a buoy watching over the anchor is of great service. When the wind and tide are in the same direction the helm should be kept over to that side which will cause the ship's head to point in the direction on which she has previously passed the anchor, as the bight of the cable will be dragging that way. The force of the tide alone will cause her to shoot over considerably; but when she is assisted by the fore-top-mast stay-sail (or stay-fore-sail in a small vessel) the sheer will be much greater. The sheet in either case is better to windward and the fore-top-sail braced sharp abox if the wind is light; but, when the tide commences to change, the sail should be allowed to fill, or it should be taken in and the helm placed in midships. If sufficient effect has not been produced by helm and head-sails before the tide ends, the mizzen-top-sail should be set as soon as the ship falls head to wind, first braced abox to turn her stern in the desired direction and then flat aback so as to drag the cable straight. Cutters and schooners have not that advantage; they must depend on the helm and head-sails. At the end of a weather tide the helm and stay-sail will guide the vessel past the anchor. If a ship should break her sheer (pass the wrong way), or during calms and variable winds should approach her anchor, the cable should be hove in, and if there is reason to suspect the clearness of the anchor it should be sighted, since it will be of no use as an anchor if a turn of cable is round the fluke. When anchoring, the state of the tide must be considered in connexion with the depth of water; a vessel was once left high-and-dry by the ebb-tide near Dungeness, and a large iron ship drove her own anchor through her bottom in the Solent, off Lyminster.

The avoidance of the anchors in shallow water is another reason for mooring.

When a ship is in an exposed position, where it may become necessary to let go two or three anchors through stress of weather, in any part of the northern hemisphere, the bower on the port side should be used first, next the foremost one on the starboard side, and as a third the after one on the starboard side, since the ordinary wind veers with the sun, and at the end of the gale the cables will be clear of each other. In the southern hemisphere the reverse order holds good.

When a ship is likely to remain many days at an anchorage where there is a tide or variable winds it is better to moor at once on arrival, with a scope of cable each way six or eight times greater than the depth of water, and an open hawse towards the worst wind. The two cables combined should always be much in excess of the distance between the anchors, otherwise they will possess but little strength to resist a rectangular strain,—an error frequently committed. The amount of support which cables will render under such circumstances will be in proportion to the sine of the angle contained between the anchor and the ship's bow and a line from one anchor to the other. Suppose, for example, a ship moored with anchors east and west of each other, 100 fathoms apart and having 55 fathoms on each cable, in 10 fathoms of water. With chain cables the hawse pipes would not be more than 53 fathoms from each anchor, consequently with a south wind the support given to the ship by each cable will only be 33 per cent. of the strain on the cable,—that is, say, 66 tons combined when the cables are strained up to 100 tons each. The support increases rapidly as the cable is veered; an addition of 5 fathoms each way will (under the above circumstances) give 101 tons, and a scope of 80 fathoms each way will give 153 tons. In practice the cables by dragging over the ground, especially soft mud, assume a direction more ahead, particularly when each cable has a long scope. The anchors should be placed sufficiently far apart to prevent fouling with the slack chain, but not farther, unless the water is too shallow to allow the ship to pass over her anchor at low tide. Such an anchorage is not suitable for very long ships unless special moorings are provided, for which purpose Parks's mooring-blocks are very suitable and inexpensive; they are commonly used in Portsmouth harbour. These blocks are recommended as moorings for the use of yachts and small craft, as being trustworthy and less likely to be stolen than anchors of any kind. Should a ship that is moored with a good scope on each cable have the misfortune to part one of them, her position will be preferable to what it would be if parted from a single anchor, as the bight of cable dragging over the ground will retard her progress, giving more time for another anchor to be let go. In all cases of veering cable either it should be done so freely that the ship will fall off broadside to the wind, when it may be secured while drifting, or it should be done very slowly, a few fathoms, or even a few feet at a time, the ship not being allowed to get any stern way. Veering during a squall should be avoided if possible; it should be done in time, before the violence of the squall is felt; but, if it is intended to pay out freely till broadside on, the head-yards should be braced abox to assist and another anchor should be ready. A cable should never be secured entirely by the bits or windlass, but the compressor and deck stoppers should participate in the strain. When unmooring, the riding cable should be veered freely to allow the ship to get directly over the lee anchor; if it is embedded, stopper the cable while vertical and heave on the other, which must break it out.

The laborious operation of clearing hawse was mitigated or avoided by the introduction of chain cables and the invention of hawse, the mooring swivel. As the cables unshackle at every 12½ or 15 fathoms, the end to be dipped round the other cable need not be long. There are two general methods of holding the weight of the lee cable while the turns are taken out. The simplest is to have a light tongue slip to take the flat link, but only about one-tenth the strength of the cable; in a large ship it should have a roller at the top, so that the end of a hawser may be rove and form a standing part. The slip being fixed on the lee cable close above the turns and the hawser taut, the nearest shackle inboard is taken out, and the short end thus formed is hauled out of the hawse-pipe by the fore-bowline, or else by a rope from the bees of the bowsprit, a hook-rope being also attached for hauling it inboard again. A boat should be in attendance from which to detach the hook-rope from the end of the cable, pass it round the riding-cable, and make it fast again to the end of the cable (hanging by the bowline) for hauling it back through the hawse-pipe; thus an elbow is formed taut round the riding-cable in the reverse direction to the elbows and turns below the slip. That operation must be repeated till the same number of turns is formed above as below the slip,—observing that a cross cannot be removed, but the lee cable can be brought under the other. When the cable is taut in and shackled, the slip is knicked off, which allows the turns to drop clear. The cables will then be as they were when moored, with the addition of one or two fathoms on the lee cable. If the short end of the cable is lowered into a boat and lifted by the bowline only for each turn,

the operation can be performed much quicker. The second method is to lash the two cables together above the turns with a piece of old rope, which acts as the slip and is cut when done with. In rough weather when a boat cannot lie under the bows the lashing must be passed by a man on the cable (if it is not high enough, heave it up), after which both cables are hove into the same hawse-pipe, whence they are easily cleared inboard; if there are many turns a small lashing will suffice in moderately deep water.

One of the objections made to slack mooring is that turns are formed below water where they are not visible. To meet this objection a piece of paper representing a ship stuck to the glass cover of a compass, with two differently coloured threads attached to paper anchors or inserted into cuts at the edge of the card, in the directions the anchors actually bear from each other, will represent all the turns which the ship makes with the cables.

Mooring-swivel. There are various ways of putting on a mooring-swivel, but doing it inboard appears to be the safest and easiest. First place it in the riding-cable by shackling the two short legs of the swivel; leave the two linked ends for the second cable, the end of which being hauled out of the hawse by the bowline is hauled into the other pipe by a hook-rope and shackled to the outer long leg; the stopper just inside the hawse (which had been holding the weight outboard of the lee cable) is then slipped and that hawse-pipe is left clear for hauling out the inner end of the lee cable, which is hauled in the other side and shackled to the inner (upper) long leg of the swivel; it then becomes a bridle. There are thus three parts of cable in that hawse-pipe; the last, having no weight, should be stopped here and there to the others so as to be carried out as the swivel is veered towards the water's edge and the bridle hove up square. Ships constructed as rams take in both bridles on the same side. A mooring-swivel should always be taken off by first heaving it inboard. If moored very slack, turns may form below the swivel during a calm with still water, but they will disappear with a cross strain; and if the ship is about to get under way the swivel and turns may be hove in together. If it becomes desirable to put on a mooring-swivel when turns are in the cables, let it be put on over them; they will soon shake out. One of the bridles is sometimes taken off the swivel for the sake of clearing that side of the deck; the error is obvious on considering that the strength of the remaining part is not equal to the strain which may come upon the span, and the nip in the hawse-pipe is always the part most severely tried. The importance of frequently white-leading and greasing all cable shackles and swivels is obvious, but, being troublesome, it is much neglected. The bow of a cable shackle should always be forward; if the reverse is the case, the shoulder may strike the side of the hawse-pipe or get jammed under the compressor. The shape of a shackle bolt should be such as to prevent it entering the wrong way; they often go half way in and jam.

Anchor. It is desirable that every vessel should carry anchors as large as she can stow and work conveniently, and cables to correspond. A wooden-stocked anchor is lighter when under water than an iron-stocked one of similar holding power, and the wooden stock is less liable to foul when let go; but the durability of iron has nearly rendered the wooden stock obsolete. The old-fashioned anchor with long shank, fluke, and stock had greater holding power and certainty of grip than the more compact dumpy anchor now in common use. Backing large anchors by smaller ones is now seldom practised, except when vessels are on shore and the anchor is laid out on a sandy bottom; it is generally better that each anchor should have its own cable and proportionate strain. Floating anchors were formerly used to keep ships' bows up in a gale; they were made of iron crossbars and three or four thicknesses of strong canvas, or a spar with a heavily weighted sail, spanned with a stout hawser; such a contrivance might frequently be improvised and used to prevent a boat or small vessel from foundering.

Lost anchors. Should an anchor be lost in sand or soft mud after having borne a heavy strain, it may be buried entirely, when it can only be recovered by grappling the chain, if that is of sufficient length. This is best done by a small anchor with a bar of iron to assist the stock and dragged by a long scope of chain. If the anchor is on ordinary ground and only sunk as far as the shank or a little more, as shown in fig. 38, it is easily recovered whether there is any cable on it or not. The full length of a hawser strong enough to weigh the anchor should be used as a sweep, with a boat at each end pulling very slowly or dropping with the tide, in the reverse direction to the strain when it parted, so as to catch the fluke as a hook. Towing a hawser against the tide is generally waste of time, and a chain forms too narrow a bight, unless the anchor is buoyed. When the anchor is felt both boats should close together and their crews pull with all their strength for a minute or two. Then, while one boat remains stationary, keeping her part of the hawser steady, the other should cross her bows with a slack hawser, which thus passes

Fig. 38.

under the tauter part; this second boat, by continuing in a circle round the anchor and returning to the side of the stationary one, will cause a turn to be formed round the fluke, as represented in the figure. Both crews should again pull hard to tighten the turn round the fluke, after which, both parts being held in one boat and made equally taut, an anchor shackle (buoyed) is placed round them and shaken down by a veer-and-haul pull on both parts by the crew of one boat, while the other tows ahead to keep a strain on the hawser till it is nearly vertical, when the anchor is secured. The ship can then take in the two parts of the hawser and weigh it.

In getting a ship under way there are a few precautions which Getting should necessarily be observed. If the ship is moored, the first under anchor to be weighed is that which it would be least convenient to way. sail from. At the time of unmooring the direction of the tide is very important in the case of sailing ships, and should not be disregarded by steamers. The hauling part of the cat-fall is always through the foremost sheave, to prevent the tackle from fouling owing to the ship's motion through the water. The cable on the second anchor should always be hove short before making sail. Should there be plenty of room and the wind moderate, there is no caution necessary beyond placing leadsmen in the chains with newly marked lines, and putting the helm hard over each way to ensure its being clear. The after-yards should be braced up on one tack and the head-yards on the other, to pay her head off; in cutters and schooners the stay-fore-sail is used for that purpose. If another vessel is at anchor too close astern to ensure gathering way while ahead of her, it should not be attempted; but, by squaring the after-yards as soon as the anchor is tripped, the ship's head will pay off till it becomes safe to fill all the sails and pass under the stern of the other vessel. The anchor should have been *catted* and perhaps *fished* also during the interval; much way should never be on the ship till the anchor is secured, for fear of it slipping or of a man falling overboard. Should rocks or shallow water be inconveniently close astern different means must be adopted. If the wind blows directly on shore, offering no choice of direction, and a current runs parallel to the shore, the ship's head should be cast against the stream. The yards should be braced abox sharp up, with as much sail set over them as the force of the wind will allow, every means being taken to heave the anchor up quickly; and, in a well-manned ship, as soon as it is out of the ground, haul on board the main-tack and aft with the sheet, set jib and spanker. The helm being alee, keep it so as long as is required, and brace round the head-yards quickly; the ship will soon spring ahead. Then, by keeping close to the wind, the rate of movement will be retarded till the anchor is secured; then set the fore-sail.

The above is applicable in moderate weather when all or nearly slipping all plain sail could be set. But, should there be a strong wind cable, and a rough sea, it might not be possible to weigh the anchor or to prevent it staving the bows if it were hove up; in that case it must be sacrificed for the safety of the ship by passing the strongest hawser from the after-port (padded with mats) to the cable, making it fast by a rolling-hitch, and hauling it taut; an axe and block should be in readiness, also guys, to prevent the spring of the hawser breaking men's legs. The courses should be reefed and all ready for setting; the top-sails (double or treble reefed) should be set or sheeted home ready for setting; and all the yards should be braced up on the tack it is intended to go off on. The first opportunity should be taken when the ship is commencing a yaw in the desired direction to slip the cable, set the fore-say-sail and fore-top-mast stay-sail; as soon as the top-sails fill, cut the spring, set the reefed courses, and the main- and mizzen-try-sails. To veer the cable previous to slipping would be more likely to break the hawser. The expedient of losing an anchor should only be resorted to when there is too much wind and sea to admit of weighing it and not too much to prevent the ship, of whatever description, from gaining something to windward under a press of sail. Otherwise her condition is made worse by the loss of the anchor; it would be better to decide upon riding the gale out, letting go other anchors, veering all the cable available, striking the top-masts, and bracing the yards nearly fore-and-aft. The cutting away of the lower-masts, when necessary, must always be done with great care to avoid killing people or bilging the ship with the wreckage. The lanyards of the lower rigging on one side should be cut as the ship rolls in that direction, and a few notches made in the mast on both sides 3 or 4 feet above the deck, the men running aft out of the way when it is likely to fall, for which operations they would have from eight to fourteen seconds. As soon as the mast has fallen the lanyards of the stays should be cut and the most strenuous efforts made to cut and clear every rope which would still hold the mast to the ship.

When weighing in rough weather with sufficient room to drift, it is better to have the anchor fully secured before making any sail; or, if it is intended to run before the wind, the ship can be kept on her course by the jib only till the anchor is stowed. Steaming up to an anchor against strong wind or tide is objectionable, as it requires great attention and judgment to avoid jerks; the same applies to steaming in a gale to ease the strain on the cable; a con-

stant watch should be kept to prevent the cable ever becoming slack. Fore-and-aft rigged vessels have much less difficulty in getting under way when close to a lee shore, as their main-sails can be fully set without holding wind, and directly she pays off all the sails draw.

Running on shore. If the anchors drag and the ship strikes the bottom, especially on rocks, and it is apprehended that she may go to pieces or founder in comparatively deep water, it would be right to select the best place on shore (if there be a choice), and endeavour to thrust her into it by slipping or breaking all the cables and making sail, if there is still the means of doing so, with the view of driving her up as high as possible and so saving life; let it also be at the top of high water, if that can be waited for. When there is a heavy strain on a chain cable it is easily broken by scratching a notch with a common saw on a link that rests firmly on the bitts and then striking it with a maul or sledge-hammer.

The usual way of testing whether the anchors are holding or not is by dropping the lead over the side and leaving the line slack; but the ship is liable to swing over it, causing it to be disturbed. A grapnel over the bow or from the bowsprit is preferable. Also by sitting on a cable before the bitts a tremulous motion is felt if the anchor is dragging.

If instead of a dead lee shore we have the wind oblique with the line of coast, and the ship from some cause too close to admit of a stern-board towards it, the head-yards should be braced abox to cast her head inshore, while the after-yards are kept square; this will cause the ship to make a long stern-board from the shore, which will not terminate till the wind is well abaft the beam. The helm up to that time may be kept in midships, as there is no reason to diminish the curve. As the stern-way is lost the helm should be put hard up, the head-yards squared, and the mizzen-top-sail kept shivering till braced up on the desired tack. The main-top-sail should be kept full. If it is necessary to get the ship round as quickly and as shortly as possible, the fore-yard, instead of being squared when about to shake, may be braced entirely round quickly so as to continue paying her bow off till the wind comes aft, then squared to allow her to come to. The jib or the fore-top-mast stay-sail (according to the weather) may be hoisted when the anchor is tripped or not, until the wind is before the beam on the desired tack; if at the former time the sheets should be hauled to windward and kept so till the ship is before the wind, then eased off till the wind comes before the beam. The spanker or mizzen-try-sail should be set as soon as it will draw the right way.

Wearing ship. What has been said about trimming the sails as the ship is turned round after casting with her head inshore is equally applicable to a case of ordinary wearing when it is desirable to turn the ship with as little loss of ground as possible. As a general guide to the position in which the yards should be placed, it may be remembered that the pressure on the sails always acts at right angles to the yards. This may be exemplified by bracing the yards sharp up when the wind is two or three points abaft the beam. As it will then blow directly into the sails they will certainly receive greater strain, but the speed of the ship will be less than when the yards were square; and it may be observed that considerable leeway will be caused by the lateral pressure. In wearing ship all the fore-and-aft sails should be taken in except the head-sails, and when the helm is put up the main-sail should be taken in and the mizzen-top-sail shivered,—the latter continued till it is sharp up for the new tack. A fashion has been adopted of leaving the mizzen-top-sail square till after the head-yards have been squared; hence everything depends for a time upon the action of the rudder, and the ship sails a considerable distance before the wind and loses so much ground. The operation of wearing a cutter requires much more care than with a square-rigged vessel on account of the heavy boom. A schooner is treated similarly, but the spars and sails are lighter in proportion to the size of the vessel. Before putting the helm up, the tack of the main-sail is triced up (the top-sail clewed up), and the peak dropped till it is nearly in a line with the boom topping-lifts, which is called scandalizing the main-sail. Both peak and boom are secured firmly in midships by means of the downhaul and sheets. Not only is the diminution of after-sail necessary to allow the vessel to pay off quickly, but the change of wind from one quarter to the other will only cause a gybe which is perfectly under control. The jib and stay-fore-sail are gybed by hauling the sheets flat just before the wind is aft so as to diminish the jerk as much as possible. The peak of the main-sail is easily rehoisted while the tack is up and the vessel luffed up to the wind. The runners and weather-boom topping-lift should be pulled up while the ship is before the wind and the top-sail-sheet hauled out as soon as the peak is up,—the tack-tackle being shifted to windward and pulled down. In wearing during fine weather, especially in yachts when racing, some risk may be preferable to the loss of time and the main-sail may be kept set. As the main-sheet is usually rove through a treble block on the boom, a double block to move along the horse, and a single block on each quarter, a strong crew can man each part at the same time and haul the boom in

midships quickly, belaying the part which was at the lee side and is about to become the weather side directly the boom is over the leading block, while the other part is kept in hand till the gybe has been effected to lessen the jerk.

The sails of all vessels are most effective when set as nearly flat as practicable, and also each sail, as well as each part of a sail, sails, should be spread at the same angle from the keel. If under that condition too much or too little weather-helm is required, the balance should be established by changing the quantity of canvas at either end or by altering the trim, not by permanently easing off a sheet, for that is as detrimental as dragging the rudder at a large angle. By altering the stand of the masts materially the angle and consequent set of all gaff-sails are thrown out.

To tack a fore-and-aft-rigged vessel is very simple; by easing off Tacking the jib and fore-sheets at the time the helm is eased down and hauling over the main-sheet, the vessel will soon run up to the wind; then if the fore-sheet is hauled flat over as for the former tack it will assist to pay her bow off the right way. The jib-sheet would be hauled aft while shaking, but not too soon to cause it to take the wrong way. The fore-sheet is shifted over as the other sails are about to fill, according to the speed with which the vessel is paying off. In a smart vessel, such as a cutter-yacht in smooth water and with a good breeze, there will be no occasion to retain the fore-sheet, but allow it to shake itself over similarly to the jib. Returning to the idea of tacking with difficulty,—the helm should be put hard over as the speed decreases and reversed directly stern-way commences; this remark applies to vessels of all shapes and sizes, as will also the advice not to put the helm over to a large angle while the vessel is going at great speed. At an angle of 10 degrees, more than 98 per cent. of the force on the rudder is applied to turning the vessel and 17½ per cent. to retard her; while at 30 degrees one-half the force would retard and 86½ per cent. tend to turn. Hence we see the reasons for recommending close fitting, broad, tapering rudders.

While the vessel is in stays the weather-boom topping-lift should be pulled to take the weight of the boom, the runner-and-tackle on the weather side set up, and the lee one slackened as soon as she is round; also shift the main tack-tackle over to windward and set it up; get a pull of the gaff-top-sail tack if necessary.

The jib of a cutter, yawl, or schooner with a running bowsprit is a difficult sail to handle when the vessel is under way. If there is sea-room it is better to keep the yacht away before the wind and let go the outhaul, when the traveller will run in, or pull at the same time on the inhaul, which should be fitted with a span to keep it square. Haul the stay-fore-sail sheet over to make room to haul in the jib to leeward of it. Gather in the slack canvas smartly to keep it from getting overboard; get hold of the luff of the sail by the stay-rope, while some hands pull on the downhaul. When the sail is perfectly under control let go the halyards and continue hauling on the stay-rope and downhaul. When there is not room to run before the wind, it is best to heave to with fore-sheet to windward while taking in or shifting a jib; by letting go the outhaul the traveller will run in and the sail can be handled as before, a good hold being always kept of the weather side, that is, the luff of the sail. If another jib is to be bent it should be laid along the weather side of the deck in readiness, with the tack forward and the head aft. The sheets are then untoggled from the former sail, handed across outside (to windward) of the fore-stay, and toggled to the second jib; also take the tack to the traveller, hook it, and run it out. Hook the halyards and hoist the jib up by them; then tauten the luff by the purchase while the sheet is flowing.

A jib-headed gaff-top-sail is preferable for use on a wind and Gaff-top-commanding breeze, though for light winds a long yard spreads a sail, fine sheet of canvas. Such a yard should be slung at one-third from the fore-end (as a boat's dipping lug), the clew-line block secured at the length of the leech from the upper end, and the standing part of the clew-line made fast to the lower end,—this last to keep it clear of the cross tree when being hauled down, which must always be done on the side it has been set, a tack being made if necessary to bring it to windward. On the approach of a squall the fore-sail should be hauled down by means of the downhaul and the vessel luffed up; it is dangerous to attempt bearing up at such a time until the main-sail has been scandalized; the effect of the water on the rudder aids greatly in tripping a vessel over.

As bad weather comes on the main-sail must be reefed (a smaller Reefing jib having been already set) by topping up the boom, easing down sails, the peak and throat, and hauling down the reef cringle to the boom by the reef-tackle; lash the tack and tie the points without rolling the slack canvas. The second and third reefs are taken in as the wind increases and the fore-sail reefed again or stowed, during which time the jib-sheet should be hauled flat, the main-tack triced up, and the vessel kept close to the wind to avoid plunging the sea over the bow. To reef the bowsprit,—house the top-mast, let the jib run in, slack the bobstays and bowsprit shrouds, take out the fid, and let the bowsprit run in one or two reefs; then refit it, set taut the gear, and set a small jib. It is at all times much more

difficult to steer a short vessel than a long one, but especially in a heavy sea, when the mode of treatment must be entirely different. A small vessel should be luffed up to meet every large wave in order to bow it as much as possible. She will have but little way on at the time of meeting it and will drop into it easily; the bow will then fall off, the sails fill, and a run be made parallel to the waves till she is luffed up again. A four-oared gig has been taken through a heavy sea under oars by pulling up to meet every dangerous crest which could not be dodged, and just before it broke over the bow backing away from it. The smallest amount of sail which can be shown by a main-sail is when it is balance-reefed; this is accomplished by close-reefing it and lowering the jaws of the gaff close down to the boom, while the peak stretches up that part of the leech above the close-reef cringle. The plan is more frequently adopted by fishing smacks than by yachts or other well-found vessels; they have a try-sail which, being laced on a smaller gaff, is hoisted by the same peak and throat halyards as the larger sail, and has its sheet secured to a bolt near the stern, while the boom is crutched and secured with the main-sail and the large gaff lashed to it. The try-sail admits of being reefed; it is a safe sail either on or off the wind in rough weather. The greatest care is necessary when running before the wind to keep the vessel on her course and to avoid gybing. A vessel should never get under way without a small boat, and a cutter should never be without her legs for fear of taking the ground unexpectedly. In racing to windward, if the wind is variable, keep nearly dead to leeward of the mark vessel, as every change in the direction of the wind will then be an advantage; unless there is a tidal preference for one direction over the other, that will of course decide it.

Tacking. If taken aback by a change of wind, and wishing to remain on the same tack, put the helm up and haul over the fore-sheet. In a ship haul over the head-sheets and brace the head-yards abox. The way to tack a ship under favourable circumstances may here be assumed as well known, and only a few hints relative to doubtful cases given. A few minutes prior to the attempt set all suitable sail, keep steadily "rap-full" with a small helm, so as to get as much way as possible. If the crew is large enough to list the ship, send them over to leeward, ease down the helm slowly, haul the boom in midships, haul down the head-sails, ease off the fore-sheet, let go the head-bowlines, and check the head-braces. Directly the wind is out of the fore-top-sail, brace the head-yards sharp up again and haul the bowlines. When the wind is entirely out of the main-top-sail, let go the top-gallant bowlines (if those sails are set) and raise tacks and sheets, except the fore-tack, which should be raised after the main-yard has been swung. As soon as the vessel loses her way, shift the helm hard over, and send the men to their stations. If she brings the wind across her bow, hoist the head-sails with the sheets on the same side as before; if the wind takes them well and the ship is still going round, give the order "main-sail haul," haul down the main-tack, aft the sheet, shift over the head-sails, haul the after-bowlines. As the main-top-sail fills, or before, according to the rapidity with which she pays off, swing the head-yards to the order of "haul off all."

Missed stays. If when near head to wind it is found that the bow is falling back and stern-way commencing, it is evident that she has "missed stays." The helm in that case should not be shifted, as with stern-way it will help her to pay her bow off in the direction it was before. The head-sails should be hoisted, the main-sail and spanker taken in, the fore-sheet hauled aft, the after-yards squared. As the wind comes abaft the beam the mizzen-top-sail should be kept shivering and the main-top-sail just full; shift the helm as she gathers headway. When before the wind square the head-yards, shift over the head-sheets, and keep them flowing. Set the spanker when it will take the right way; complete wearing as before described. This is similar to "box-hauling"; it is not necessary to brace the head-yards abox if she will fall off without. The manoeuvre of putting the helm down and letting the ship shoot up in the wind before wearing is sometimes adopted for the sake of diminishing the run to leeward. Hauling all the yards at once is very objectionable; the sails are longer aback and have to be hauled round by main strength against the pressure of the wind.

Club-hauling. "Club-hauling" may occasionally save a ship even in these days of steam, as a paddle-steamer will not turn with her head against a strong gale and a heavy sea, nor will a sailing-ship with an auxiliary screw-propeller. It may be done when the ship is found edging down on a lee shore, too close to wear, and having a depth of water not exceeding 20 fathoms. It will take two or three minutes to open the hawse-pipe, get the cable clear, and procure hammer and punches for unshackling, and mauls for breaking the cable if necessary. Put the helm down and act as in ordinary tacking till she ceases to turn nearer to the wind; then let go the anchor, whether she has entirely lost her way or not, as passing the anchor a little will give a greater swing back when the strain comes and allow more time for slipping the cable, which should be done directly the wind has crossed the bow; at the same time swing the after-yards. If the cable has been slipped successfully, the head-yards may be hauled as soon as the after-yards have been braced up, as

she will soon be broadside on. It has been proposed to run a spring from the after-lee-port to the anchor, but that would take too much time.

"Backing and filling" is practised in a tidal channel which is Backing too narrow to allow a ship to gather way for tacking. One top-sail, and with the jib and spanker occasionally, is generally sufficient to give filling. slight head or stern way, to avoid either bank or another vessel, while the tide carries her broadside against the wind; the less sail exposed the less the lee-way. Fore-and-aft vessels having less power to get stern-way should have a boat in attendance with a line and a small anchor.

"Kedging" was a frequent performance before steam-tugs were Kedging introduced; it consisted of a series of movements from one small anchor to another, previously laid out by boats. For a similar purpose harbours that were much frequented were formerly furnished with a succession of warping buoys. The large ropes used for transporting ships are called hawsers, and by a strange anomaly were formerly cable-laid nine-stranded. Such rope is hard and stiff to handle; it absorbs more wet and retains it longer, therefore is less durable; when new the strength is far inferior to hawser-laid rope of similar size. Manila and coir hawsers float on the water and are therefore very useful.

Dropping through a narrow tidal channel by means of an anchor Dredging just touching the bottom is called "dredging" or clubbing; it can ing. be practised in a passage which is too narrow for backing and filling, such as the upper part of the Thames, where it is done every day. The vessel swings to her anchor and points her stern up (or down) the stream; by heaving in the cable (for which the steam capstans and windlasses afford great facility) the tide takes the ship on as fast as it is running so long as the course remains clear. When it is desirable to approach either side, a few fathoms of cable paid out will cause it to hold; the helm and the action of the tide will then sheer the ship as desired, and by heaving in cable she will go on again, so that a sailing-ship should go up at half the rate of the tide at least. With a screw-steamer it is far easier, as the screw will straighten her as well as the tide, and when fairly pointed through an open space she can make a stern-board at five knots an hour while perfectly under control.

A few words may be said about making and shortening sail in Making bad weather. One point holds good in all cases: the sails should and never be allowed to flap, as that exposes them to the danger of shorten-splitting. The tack or luff is invariably secured first, while the ing sail sheet bears a steady strain enough to keep the sail from shaking. Before hoisting fore-and-aft sails the sheets are steadied aft; and, should a sheet carry away, the sail is hauled down or brailed up instantly. Spankers and try-sails should be taken in entirely by the lee-brails, the slack only of the weather-brails being at first taken down. A practice has become general in the British navy of securing the top-sail clew-line blocks to the lower cap instead of round the yard, for the sake of saving time when shifting top-sail-yards; the use of the clew-lines for hauling the yard down and steady-ing it is thus lost; this is one of many objectionable practices.

There has been a difference of opinion as to the mode of setting Top-sails and taking in top-sails and courses; but the same rule should apply and to all square sails alike: that which is safest for one will be safest courses. for the others. Experience and the balance of opinion favour the hauling home of the weather top-gallant-sheet, top-sail-sheet, and tack of the fore-sail or main-sail first, with a good strain on the clew-lines, clew-garnets, and bunt-lines, to avoid flapping. The lee sheet may then be hauled and eased down by clew-line and bunt-line. Each bowline should also be steadied taut in succession to prevent the leech from flapping. There appears to be no advantage in first hauling the lee-sheet partially down. The taking in of these sails has been equally a matter of dispute, and many advocate taking in a top-sail in a different manner from that which they would adopt in taking in a course. Falconer's rule was often quoted and followed in former times. It runs thus—

"And he who strives the tempest to disarm,
Will never first embrial the lee yard-arm."

It must be remembered that the decision there supported by the sea-poet was then a novelty, and opposed to the opinion of the practical seaman. A main-sail had been split by "letting fly" the sheet; but that proves nothing, as all sails will split if the clew flies loose in a gale. The lee clew of an eighty-gun ship's main-top-sail was blown over the yard-arm in consequence of the weather-sheet having carried away; that clew was hauled up first. It might not have happened had the bunt-lines been well manned and had there been a small strain on the lee bowline. Either plan will answer if the bunt-lines are well manned and the sheets eased steadily; but that the weather clew should be set first and taken in last is preferable.

In taking in top-gallant-sails before the wind both sheets should be kept fast till the yard is down. When a top-sail is to be reefed the yard should be pointed to the wind; and for the first reef the top-gallant-sheets, bunt-line, and bowlines should be hauled taut, for the second reef the top-gallant-sail should be clewed up, to keep the sheets from knocking the men at the yard-arms. In rough

weather a preventer parrel and rolling-tackle should be put on before the men go on the yards. For a fourth reef the top-sail should be clewed up during the operation; it will then be performed with less difficulty. The long reef-points in top-sails and courses have generally given place to the lighter and more expeditious method of having reef-lines on the sails, with becketts and toggles on the jackstay. The whole strain of the sail is thus thrown on the jackstay and small eyebolts, instead of the points being firmly tied round the yard itself. Also the slab of each reef is usually allowed to hang down and chafe at the fold; but this can be prevented by fastening three or four small slab-lines on each side of each reef. Cunningham's invention for reefing top-sails is very valuable in all weakly manned ships, but it requires to be kept square upon the yard while rolling up. If it becomes necessary to shift a top-sail during a gale, it should be made up on deck in the shape it would assume if furled on the yard, and stopped with spun-yarn, with the reef-earings and bowline bridles showing near the ends and the clews and bunt-line toggles near the centre, where it would be slung by a slip stop. When the two earings are taken into the centre it will form four parts, and the weather top-mast studding-sail halyards being bent round it will cause it to look like a large bale. In that state it is hoisted into the top by the sail tackle, at the same time being steadied by the studding-sail halyards; there all the ropes are bent, clew-lines and bunt-lines hauled up, reef-tackles hauled out, and the sail bent to the yard before the stops are slipped or cut; then it is reefed as desired before the weather sheet is hauled home. A fore-sail or main-sail is bent in a similar manner, except that the various ropes employed on a course are bent on deck, by which ropes and the burtens it is swayed up. Studding-sails are very useful in long voyages; their disuse on the main-mast is to be regretted, especially in long ships. A top-mast or top-gallant studding-sail is shifted "before all," by a man on the yard gathering in the sail as it is lowered to him and holding the outer leech till it cants the right way.

Coasting. During a coasting voyage the vessel must be within a moderate distance of the shore, therefore the person in charge should constantly be ready to run for shelter when necessary, and have the moral courage to do it in time. In yachting voyages, however distant, there is a natural desire to see the land and all that is worth seeing, and, being well provided with charts, such vessels can enter any harbour, when perhaps a pilot is not able to get out. A ship starting on a foreign voyage should seek "blue water" as soon as possible, and keep a safe distance from all land which is liable to become a lee shore, and not be tempted to edge in because a certain tack is much nearer to the desired course than the other. For the choice of track and for trade winds, see NAVIGATION.

Heaving to. To heave to for the purpose of stopping is done in a cutter by easing off the jib-sheet, hauling over the weather fore-sheet, and tricing up the tack of the main-sail. A schooner is treated similarly: the top-sail (if she has one) is backed and the gaff-fore-sail is taken in. A ship has her courses hauled up, head-sheets eased off, and either the main or fore yard squared. Upon the latter point opinions differ. If two ships are close together, the one to windward had better back the main-top-sail and the ship to leeward the fore-top-sail; they should always preserve a little headway. Boats invariably board ships on the lee side; small vessels, when drifting fast, on the weather side. A ship at anchor in a tide-way will always present a lee side during some period; but a "weather tide" causes a dangerous sea for boats. A boat's oars should never be tossed up or forward when there is danger of their fouling, for fear of staving the boat or injuring some one in the after part.

When in the vicinity of a lee beach and landing by means of a boat is determined on, the oars should be manned to the utmost and the waves watched (as they always vary), and the boat forced in on the top of the third large wave, care being taken to keep her exactly end on to the sea. At the instant of touching the ground every man should jump out and begin to haul up the boat, if she is of reasonable weight; the next wave will probably put them all out of danger. By holding on to the boat they give and receive mutual support, and avoid being sucked back by the receding water or crushed by the boat.

The term "hove to" as applied to a vessel in a gale of wind is derived from the desire to turn her bow up towards the wind and sea; this under all circumstances of sail should be the point aimed at, since then the seas strike the side obliquely and also the bow, which is the strongest part. The best sails to keep on a ship during a violent gale are the close-reefed main-top-sail, main- and mizzen-try-sails, and fore-stay-sail. The fore-try-sail also may do good, and is far preferable to a main-stay-sail. The pressure of the main-top-sail tends greatly to mitigate the violent motion; also by heeling the ship she presents a higher side to keep the sea out and a sloping deck to aid the water in running off. The helm should be about one turn "a-lee," never hard down. When north of the equator ships should heave to on the starboard tack, and the reverse in southern latitudes. More sail should be made as soon as the gale moderates, to steady the ship. The violent rolling motion may sometimes be diminished by altering course, so that the period be-

tween the waves reaching the vessel may be made to disagree with her own period of oscillation, or when running before the wind by bracing the yards up in opposite directions. Steamers at a reduced speed can scarcely be considered as hove to; their masts and sails are too weak to be of any use in a gale and too small in moderate winds; they make the rudder do all the work. The best sail to send under is close-reefed main-top-sail, reefed fore-sail, and fore-top-mast stay-sail.

Three contingencies should always be anticipated by the captain and officer of the watch, and in some degree by every man in the crew, so that the alarm should lose half its dread and be met by prompt action,—a man falling overboard, fire, and collision. A boat's crew should be appointed in each watch, who on going on deck should see the boat ready and the plug in. If the ship be on a wind and capable of tacking, on the cry "A man overboard!" the Man helm should be put down and the ship steered round on the other over-tack, with either the fore or main yards left square and the courses board up; she will then drift down towards the man, while the boat, which was at first on the weather side, is being lowered to pick him up. If the ship is running free the case is worse; she must be brought to the wind instantly with the head-yards square. Various plans have been devised for lowering boats, many of them very good when executed by trustworthy men; the same may be said of the old system with plain blocks and tackles; practice and coolness will render either successful.

With regard to fire, prevention is better than cure; lights in the Fire hold should never be without a protecting lantern, and passengers' sleeping-cabins should be lighted by lamps fixed in the bulkhead, inaccessible from the inside. Pumps and engines for extinguishing fire should be on the upper deck, for fear of being cut off by the first outbreak. Fire stations and exercise should be frequent even with the smallest crew. On the first alarm all ports and ventilators should be closed, wind-sails hauled up, hatchways closed as much as practicable, awnings and all lower sails taken in, and the ship kept before the wind, unless the fire is in the after-part, in which case the boats should be lowered at once. Many other things will present themselves to a cool head; perhaps the first order should be "Silence!"

Collisions may be reckoned among those dangers against which Collision. no man can guard himself, be he ever so wise and experienced; it avails not that one ship should do what is right, unless they both do so. The laws upon the subject appear to be all that can be desired (see "Rules of the Road," under NAVIGATION, vol. xvii. p. 277); but the mode of enforcing obedience is very lax and lenient. A purely nautical tribunal is greatly needed, and every unjustifiable deviation should be severely punished, whether followed by an accident or not. It is admitted that in most cases of collision the evidence is so conflicting that a judge must be puzzled where to find the truth. The great increase of speed diminishes the time of approach; the increased length of vessels demands a larger circle to turn in; the want of sail at the extremities diminishes the power of turning, throwing all the work on the rudder, which is proportionately much smaller than it was. The perpendicular stem gives a deadly blow at the flat side, instead of first cutting down the upper works by the sloping cut-water, and probably coming to a state of rest before reaching the water's edge. Sufficient care is not taken to keep all lights from the upper deck and all places where they may disable the eyes of the officer in charge or the lookout men. Even holes have been made at the back of the bow-light box to enable the officer of the watch to see them burning; of course his eyes are thereby rendered unserviceable for seeing distant objects. Officers in the merchant service are invariably in two watches, which does not allow them sufficient time for sleep, especially in windy weather. If immediate action is not taken the instant a sail or a light is reported, the officer in charge should take bearings by the compass, by which he will soon know if the other vessel is inclined to pass ahead or astern. If it remains stationary by the compass, they must both be converging on the same spot.

If a ship should spring a leak at sea which may be attributable Leaks. to straining and is sufficiently serious, she should be run before the wind and sea under small sail. If the pumps then clear out the water, she may run for a port or resume her voyage when the gale ceases. If the leak does not abate, though the motion of the ship is easy, it will be evident that a butt (end of a plank) has started if it is a wooden ship, or that a plate has given way if an iron ship. In that case, two stout hauling-lines should be placed under the bowsprit and head-gear, and the end of one secured to the head-earring, the other to the clew of a spare top-sail or course, also two similar ropes to the other side, each of the four ropes being marked at 10 and 15 fathoms from the sail. Half a hundredweight of iron (shot or furnace bars) should be attached to each clew, the ship's progress completely stopped, the sail thrown overboard and drawn square across the bows; the hauling-lines on the clews being carried aft and kept square by the marks, while the ropes on the head of the sail are veered, the sail is placed like a large patch over the place desired. Should the position of the leak not be discovered, it might be well to place the sail under the main-mast;

if this has no effect, place another sail under the fore-mast and the fore-foot. This simple device is no doubt very ancient and was probably the process called in the book of Acts "undergirding the ship." Sails have usually been thrummed; but that requires much time, and the utility is questionable. If a large hole has been made by collision a spread sail would be burst by the pressure; but, such a hole being usually at the side and partially visible, a large sail nearly in the form in which it was stowed, having the stops cut, should be thrown over before the hole end downwards, and, when sunk below the supposed depth of the fissure, brought towards it till the bight of the sail enters the vortex, when it will be sucked in violently and either disappear within the ship or block the hole; if the latter, smaller sails can be spread slack over the hole to be sucked in. The use of sails for the above purposes has been strangely neglected during late years, though much more frequently needed.

A leak can be stopped from inboard when accessible by placing over it pads of oiled or tarred canvas, tarred coal-sacks, bags of white lead, tallow, paint, clay, or any material which fits close when pressed by boards and shored down firmly,—that or something similar could be done when a ship is on shore. If a ship is on shore with a large hole in one part of her bottom, she might be recovered, especially if ebb-tide recedes many feet, by building a double partition with a space of about 2 feet between on each side of the injured part, filling the space with clay, and shoring it well,—in other words, by improvising two water-tight bulkheads; the water having been pumped out of the sound parts the rising tide would float her. When a ship is on shore with numerous cracks in her bottom, but not a clear hole, she may be floated by constant pumping, even though at first the expedient should fail to prevent the tide from ebbing and flowing in the hold. By maintaining as much as possible an inward flow the small fissures will gradually choke with weed and sand, till the inflow is so reduced as to be within the power of the pumps; hay, oakum, or dirt of any kind should be thrown over where it can be sucked into the leak. The ordinary pumps of a ship may be supplemented by nailing together four common deal boards and fitting two square valves weighted with lead, hinged and lined with leather, to rest on seats 2 feet from one end, which must be weighted on the outside as the bottom. A large hole near the top should be provided with a leather lip to shoot the water over the combings. When slung in the bights of two ropes four men jerk it up and down; the force with which it descends through the water will send a stream up the tube with less labour than baling entails.

Ship on shore.

Ships on shore should be secured from driving into a worse position before being freed from any weight. Hard substances such as guns and shot should not be thrown on the lee side or where the ship in hauling off might strike on them. Keep sufficient fresh water for immediate use. An anchor is usually carried out between two boats, the flukes being hung to a spar across the boats chocked up from the thwarts, while the stock is suspended across the sterns of the boats. The boats should be hauled out to a kedge anchor, while other boats support short bights of hemp cable. Good axes should be used for letting go the anchor.

Rudders.

A wooden rudder when immersed is very little heavier than water and can be shipped and unshipped by seamen with ordinary appliances; but iron ships have metal rudders sometimes weighing as much as 20 tons. The following remarks apply to wooden rudders only. To unhang a rudder remove the woodlock,—a chock recessed and nailed to the stern-post close above the upper pintle,—the use of which is to prevent it being unhung by accident. From a beam or chock above the rudder-head suspend two luff-tackles, single blocks, and two leads up, and the double blocks down to stops through the tiller hole. A few men on each luff-fall will easily lift the rudder the length of the pintles; and as they are drawn from the gudgeons it will swing free and may be lowered between two boats provided with spars across their gunnels; the bight of a rope will bring the heel up to a position similar to that of the head,—nearly horizontal. It can then be taken under the main-yard and hoisted in, or be carried for repair to a wharf or suitable beach at high water. Before a rudder is taken off to be hung, two long guys are rove through holes for the purpose at the fore-part of the heel, one end of each being hitched to the band for the rudder-chains, while the other is in readiness to hand into the ship half-way forward and low down. On the rudder-head being suspended by the luff-tackles a little higher than its position when shipped, the guys will haul it to the exact line with the stern-post; it is then lowered into the gudgeons, the guys unrove by means of the short ends, and the woodlock replaced. Smooth water is desirable for that operation; a little tide in a line with the keel will assist. The tiller should be firmly wedged or secured in the rudder-head so as to prevent any jerking motion; for the same reason, the wheel ropes should be kept moderately taut; they should also be rove in two parts, lashed together on top of the wheel, for convenience in shifting them one part at a time. The rudder-chains are shackled to a band, which embraces the rudder a little above the water, and are attached to a stout rope, usually stopped up round the counter ready

to receive tackles, by which the ship may be steered imperfectly after the rudder-head is disabled.

The construction of a temporary rudder has always been considered an interesting and highly useful piece of seamanship. One easy plan is to pass the end of a large hemp cable out of the rudder-hole or central port, haul it up to the ship's side, lash to it one or more large spars, sling the whole bundle about the centre of the spars with stout hawsers as guys, throw it overboard, and heave in a part of the cable, leaving the part with the spars lashed to the side of it far enough away not to be lifted out of the water with the pitch of the ship. The guys when rove through blocks on the spare top-sail yard-arms, which are lashed across the gunnel for the purpose, are taken to the capstan; by this means the ship may be steered with the assistance of her sails. If there be not a hemp cable on board, the largest hawser must be used with a spare top-mast or the largest spar available.

Early in the 19th century Captain Edward Pakenham contrived an efficient rudder with the material in his ship. Part of a top-mast heel up formed the rudder-head and main-piece, the fid-hole becoming the tiller-hole. The main-piece passed through the round hole of the lower cap, which was made of elm and lined with leather, and which, being secured by a collar near the lower part, acted for pintles and gudgeons, and was drawn into place by two hawsers *h, h*, till it embraced the stern-post by the square intended for the mast-head (fig. 39). There should be ropes to the bolts *b, b* to keep it horizontal. Another top-mast was cut, which with the remainder of the first made four parts in all, flattened and fitted together, woodled and bolted, and so forming the required width. Three pigs of ballast were let into the lower part and the whole planked over and secured with spike nails. Fine weather was necessary for shipping it and a collar was built above the rudder-hole to confine the motion and to support the weight. The materials carried in modern ships may differ, but a fertile mind will generally find substitutes. The "Pique" frigate, commanded by the Hon. H. J. Rous, steered across the Atlantic during sixteen days of almost continuous gales, a distance of 1500 miles, by means of a cable over the stern and a Pakenham rudder during part of the time. She had been on shore in the Gulf of St Lawrence; during the voyage she was making 20 inches of water an hour and she had also two masts sprung; she reached St Helens in the Isle of Wight on the 13th of October 1835.

Fig. 39.

It is a difficult thing to get a lower yard from the deck into its Raising place without letting go either stays or rigging, and this the following instance will illustrate. The "Thunderer," an eighty-four yard gun ship, broke her main-yard, which was 112 feet long, completely in two, 5 feet to leeward of the slings. The broken parts were sent down, and a main-top-sail-yard crossed instead, while a reefed top-sail did duty as a course and a mizzen-top-sail over it as a main-top-sail. The parts of the main-yard were placed together on deck; the two halves of a spare anchor stock were let in on the fore and aft sides and an oak mast fish on top, with some studding-sail-booms to round it off. All parts were bolted, hooped, and woodled together, making it as strong as ever it was, entirely from the material carried in the ship. The sketch (fig. 40) represents the time of dipping the port yard-arm under the main-stay; *γ* represents the jeers, which bear the principal weight (total, 5½ tons); *f* the two fore-tackles lashed to the mast-head pendants; *t* a top-burton; *s* a sail-tackle to the top-mast-head; *m*, *m* main-tackles from the mast-head pendants; *l* the main-lift; *y* a yard-tackle secured to an upper-deck beam. The main-yard was entirely rigged before being crossed; the blocks are not shown. In a long ship the operation would be easier. When a fore-yard has to be got across from the deck, time and trouble can be saved by letting go, half at a time, all the fore-rigging and back-stays which are on that side.

Fig. 40.

When feeling the way into harbour during a thick fog, let a boat pretend to tow the ship with the deep-sea lead-line; by this means a margin of 100 fathoms of safety will be secured. Care should be taken that every running rope in the ship be slacked previous to rain or heavy dew.

H. Dana, *Seaman's Manual* (10th ed., 1867); Captain Alston, *Seamanship*; Charles Bushell, *Rigger's Guide*; Captain Sir George S. Nares, *Seamanship* (6th ed.).

GLOSSARY.1

A.B., "able-bodied," signifies a trained seaman. **Abaft** (prep. and adv.), relatively nearer the stern. **Abeam**, in a direction abreast the ship. **About ship**, to tack or turn head to wind. **Accommodation-ladder**, a flight of steps over the side, suitable for ladies. **Adrift**, severed from all security. **Aft**, towards the stern. **Arming the lead**, placing tallow in the cavity at the end to bring up specimens from the bottom. **Astern**, behind; to pass astern is to go behind. **Athwart**, across; as across the bows. **Avast** (as in the expressions, "Avast there," "Avast heaving"), stop.

Back and fill, a mode of drifting safely with the tide, against the wind. **Back a sail**, to let the wind press it the reverse way. **Backstay**, a support at the side and abaft an upper mast. **Bale-slings**, a long strap of rope for hoisting packages. **Ballast**, anything carried for the sake of its weight. **Banyan-day**, formerly a fast-day on which oatmeal was issued in lieu of meat. **Bare poles**, at sea without any sail set. **Barrica**, a small cask for water in boats. **Batten down**, to cover the hatchways with canvas secured with battens, in order to exclude the sea. **Beam**, the extreme width. **Beam-ends**, a ship is on her beam-ends when inclining over at a right angle. **Bear a hand**, make haste. **Bear away and bear up**, steer farther from the wind. **Bearing**, direction; **down to her bearings**, a point in the inclination of a good ship at which she resists going further. **Becket**, a rope eye to receive a knot or toggle. **Bees**, strong projections bolted on each side the bowsprit. **Belay**, to secure a rope by turns round a belaying pin or cleat. **Bells**, one sound is made for each half-hour from setting the watch (see "watch"). **Belly**, in a mast, a curve with the convex side aft. **Belly-band**, a broad strip of canvas across the middle of a sail, to strengthen it. **Belly-stay**, a rope from the centre of the mast led forward. **Bend**, sails are said to be bent to the yards; a kink formed in a hemp cable when stowing it; to make fast anything; to bend on. **Bentick shrouds**, formerly used to assist the futtock shrouds and set up on deck. **Berth**, the situation of a ship or other thing. **Between wind and water**, at the water's edge. **Bight**, a loop formed by a rope. **Bilge**, a gutter nearly the length of the bottom of the ship; hence bilge-water. **Binnacle**, a box for the compass. **Bite**, the anchor bites when it hooks the ground. **Bits**, a rack with sheaves and pins; cross timbers or iron to secure the cable. **Block**, a shell of wood or metal containing one or more sheaves. **Blue water**, clear of the English Channel; at a distance from shore. **Bluff**, broad, as applied to the bows. **Boarding-netting**, a rope net to exclude an enemy. **Bobstays**, strong ropes or chains to keep the bowsprit down. **Bold shore**, that which has deep water close to it. **Bolsters**, soft wood and canvas under the eyes of the rigging. **Bolt-rope**, a superior description, made of fine yarn, used for roping sails. **Bonnet**, an addition to a try-sail (or other sail), attached by a row of becketts rove through each other. **Boom-irons**, supports for studding-sail-booms. **Booms**, spare spars (indistinctly). **Both sheets aft**, running before the wind. **Bower anchors**, the two principal anchors for use. **Bowline**, a rope to bow the leech of the sail forward; **bowline-brille**, a span for the same; to **sail on a bowline**, to sail close to the wind. **Bowse**, a violent pull. **Box**, or braced **aboa**, the head-yards crossed the reverse way of the after-yards; **box her off**, to force her bow from the wind. **Box-hauling**, letting the ship come to the wind, hauling round all the yards, making a stern-board, and wearing. **Brace to or by**, to bring the yards back a little, to make them shake or nearly so. **Brace up**, to place the yards as far forward as they will go. **Brail up**, to take in a sail by means of brails. **Break bulk**, to commence discharging cargo. **Break her sheer**, to pass the wrong side of her anchor. **Breast-fast**, a security at right angles to the side. **Bridle**, two parts of cable from the hawse to a mooring. **Bring by the lee**, to fall off till the wind, after crossing the stern, backs the sails. **Bring to**, either to anchor or to stop by backing a sail; to connect the cable with the capstan, or a tackle to a rope. **Broaching to**, coming to the wind against the helm. **Broadside**, the whole side; the discharge of every gun on one side. **Broadside on**, the flat side against anything. **Broken-backed**, a state caused by weakness or strain, when the centre sinks unduly (see "hogged"). **Bucklers**, shutters and bars to secure the hawse-holes at sea. **Bulk**, the cargo is stowed in bulk when without sacks or packages. **Bull-rope**, a rope from the jibboom to keep a buoy or boat from the bows. **Bull's-eye**, a wooden fair lead or a round thick piece of glass. **Bumpkin**, a short spar projecting from each bow, to which the fore-tack is hauled down; it is supported by **bumpkin-shrouds**. **Bunt**, the centre part of a square sail when furled. **Bunt-lines**, ropes from the foot of a sail by which to haul it up. **Buoy-rope**, the rope between the crown of the anchor and the buoy. **Burton**, a long purchase with a double and a single block. **Bush of a sheave**, the brass lining upon which the pin rests. **Butt**, the end of a plank. **Butt-slings**, strong slings for casks. **By**, brace the yards by, nearly in the direction of the wind, but not so as to shake. **By the board**, overboard entirely, as a mast going over the side. **By the head or stern**, drawing more water forward or aft.

Cable-laid, the designation of nine-stranded rope. **Cahoose**, a cook-house on deck. **Can't**, to turn over. **Cap**, a large piece of elm fitted on the top of a mast by a square hole, with a round hole for an upper mast to slide through; with iron masts the cap is of iron. **Capshore**, a support to the fore-part of a lower cap. **Capstan**, a drum on a vertical spindle for heaving heavy weights. **Carreen**, to heel over bottom out of water for repairs. **Cast off**, to let go. **Cat-block and cat-fall**, used in hoisting the anchor. **Catharpin legs**, short ropes connecting the lower parts of the futtock shrouds. **Cat-head**, timber-head projecting from the bow on which to hang the anchor. **Cat's-paw**, a slight puff of wind; a means of hooking a rope. **Caval**, a large cleat for securing ropes. **Chafing-mats**, mats to protect the rigging. **Chain-plate**, an iron plate securing a dead-eye. **Chain-pump**, the largest hand-pump, which by an endless chain and valves produces a continuous flow. **Channels or chains**, projections from the ship's side to spread the rigging. **Chock-a-block or block and block**, when the blocks of a tackle meet together. **Choke-a-luff**, to pass turns of spun-yarn round both parts of the fall to prevent their moving when let go. **Cleat**, a piece of beech with two horns for belaying ropes; a piece of wood nailed to secure a thing from slipping. **Clew-garnet**, for hauling up the clew of a course. **Clew-line**, the rope which hauls up the clew. **Clew of a sail**, the corner to which the sheet is attached. **Clews**, an arrangement of small lines called knittles for hanging cots and hammocks. **Clinch**, the inner end of a cable; also a mode of fastening a hemp cable to an anchor, and for other purposes. **Clubbing, dredging, or driving**, each word implies dropping with the tide, while the ship is governed by the helm and an anchor scraping the bottom. **Club-haul**, to tack by means of letting go and losing an anchor. **Coamings**, the raised frame of a hatchway. **Cockbill**, when the anchor hangs loose from the cat-head. **Collars**, the upper parts of the stays and large straps round the bowsprit. **Come up**, to render slack or let go. **Coming up**, when the change of wind allows a nearer approach to the course. **Commander**, a large mallet for hammering rope. **Companion**, a high covering over a hatchway. **Compressor**, a curved bar to squeeze the chain cable against a beam as a stopper. **Conning**, directing the helmsman. **Counter**, the angle of the stern on either side. **Courses**, fore-sail and main-sail of a square-rigged vessel. **Crank**, unstable, easily turned over. **Cringle**, an iron ring to confine a sail to a stay; an eye formed by a strand on the leech of a sail. **Crossing the bows**, passing close ahead. **Cross-trees**, spreaders under the tops and at the top-mast heads to support the top-gallant rigging. **Crow's-foot**, several spans of small rope brought to a common centre. **Crow's-nest**, a seat for a lookout man at the top-gallant mast-head. **Crupper**, a chain to

keep down the heel of the jibboom. **Crutch**, an iron rest for a boom; a metal swivel for an oar to work in. **Cut and run**, to cut the cable and go in haste.

Davit, a derrick of wood or iron to lift a weight. **Deaden her way**, to retard progress. **Dead-eye**, a clump of wood with three holes, without sheaves; an iron frame for setting up rigging. **Derrick**, a single spar held by guys to lift a weight. **Dog**, to pass the tails of a stopper or other ropes zigzag. **Dog's-ear**, the leech of the sail between the reefs when allowed to stick up. **Dog-vane**, made of feathers for the use of the quartermaster. **Dog-watch**, 4 to 6 and 6 to 8 P.M.; figuratively, a short time. **Douse**, to lower a sail; put out a light. **Drag**, applied to an anchor not holding. **Draught**, the depth of water required to float the ship. **Draw**, when a sail takes the wind properly. **Dredging**, see "clubbing." **Drift**, floating without guidance. **Driving**, dragging the anchor unavoidably in a gale; dropping intentionally with the tide and very little cable. **Drop astern**, to fall behind. **Drop of a sail**, the distance the foot is from the yard. **Dunnage**, firewood or valueless things placed under the cargo.

Earrings, the upper corners of a square sail; the ropes by which they are secured to the yard. **Ease her**, in steamers, go slow. **Ease off**, to slacken a rope. **Ease the helm**, move it back towards midships. **Edge away**, to steer farther from the wind, or obliquely from a ship. **Edge in with**, to steer obliquely towards something. **Elbow**, an angle formed by two cables or ropes. **Embrail**, to brail up (obsolete). **End for end**, changing a half-worn rope, substituting a strong part for a weak. **End on**, in a direct line with the length of the ship. **Estivador or stevedore**, a man who stows holds but does not go to sea. **Even keel**, when a ship draws as much water forward as aft.

Fag-end, the end of a rope unlaid; refuse. **Fair-way**, the free passage to a harbour. **Fair wind**, a wind which allows a ship to steer direct for her destination. **Fake**, one circle of a coil of rope. **Fake down**, to arrange a rope to and fro clear for running. **Fall**, of a tackle, the part which is hauled upon. **Falling off**, when the change of wind obliges the ship to deviate farther from her course. **False keel**, an addition to the main keel, not vital to the strength of the ship. **Fetch way**, to move through being insecure. **Fid**, a piece of wood or iron to key up a mast or keep out a cutter's bowsprit; a wooden cone used by riggers. **Fill**, to place the sails to the wind so as to propel the ship forward. **Fish**, a piece of wood or iron secured to a weak mast or yard to strengthen it. **Fish-davit**, a derrick for hoisting the flukes of an anchor; hence **fish-block**, **fish-hook**, **fish-fall**. **Flat aft**, when the sheet of a sail is as taut as it can be; **flatten in** is the order to produce that effect. **Flaw of wind**, wind sudden and unstable in force and direction. **Fleet**, to rearrange a purchase for another pull. **Flemish horse**, a foot-rope at the yard-arm for men to stand on. **Flotilla**, a fleet of small vessels. **Flowing sheet**, the sheet eased off to a fair wind. **Flush**, level. **Flush-decked**, having neither poop nor fore-castle. **Foot-ropes**, ropes on the yards, the jibboom, and the flying-jibboom for men to stand upon. **Fore and aft**, from one end to the other lengthways of the ship. **Fore-and-aft sails**, those not set on yards, therefore capable of being placed in a line with the keel. **Fore-castle**, the front part of the upper deck, but more correctly the deck built over that part; **top-gallant fore-castle**, a short piece of deck open beneath. **Fore peak**, under the front part of the deck; the forward extremity. **Fore reach**, to sail faster through the water than another when on a wind, though not gaining to windward. **Forge ahead**, the ship moving ahead slightly when hove to, or in a calm, or over a shoal. **Foul**, entangled (of a rope); contrary (of a wind) - weedy (of the bottom). **Foul hawse**, when the cables are twisted. **Frappling**, an irregular lashing to bind things together. **Freeboard**, that part which is above water. **Freshen the nip**, to veer a little cable, or any rope, in order to relieve the parts strained. **Full and by**, to steer close to the wind, keeping the sails full. **Funnel**, a copper sheath at the top-mast or top-gallant-mast head. **Furl**, to roll up square sails; other sails are **stowed**. **Futtock-shrouds**, short ropes below each top.

Gammmoning, a strong lashing of rope or chain to secure the bowsprit down to the head knee. **Gangboard**, a plank with battens for people to walk upon. **Gangway**, the narrow deck between the quarter-deck and fore-castle; the entrance to a ship; any passage kept clear. **Gaskets**, bands of platted rope-yarns to secure the sails when furled. **Gird-lines**, ropes which are on a mast when it is hoisted in and by which the shrouds are triced up. **Girt**, when the mooring cables are so stretched as to prevent the ship swinging freely. **Glut**, a piece of wood which keeps a knot or hitch from closing. **Goose-neck**, a crooked iron to support a studding-sail-boom. **Goose-wings**, the parts of a course which are exposed to the wind when confined by clew-garnets and bunt-lines only. **Graft**, to cover a rope with fine line in an ornamental manner. **Gripping**, coming up to the wind against the helm. **Ground-tackle**, anchors, cables, and all connected with them. **Grow**, a term applied to the direction of the cable when it is being hove in. **Grunnet**, a rope ring made by a strand. **Gudgeon**, that part of the hanging of a rudder which is bolted to the stern-post. **Guess-warp**, a rope stretched taut to haul something to and fro upon. **Gunnal or gunwale**, the highest part of the bulwark. **Cruys**, ropes to keep a spar or other thing in the desired position. **Gybe**, to let a fore-and-aft sail shift from one side to the other when nearly before the wind.

Halvyards, ropes exclusively for hoisting sails. **Hand over hand**, to pull with one hand after the other; figuratively, done quickly. **Handsomely**, an injunction signifying slow motion; with care. **Handy billy**, a small axe kept on deck. **Hard down and hard-a-lee**, position of the helm, the reverse of **hard-a-weather** and **hard up**. **Haul on board**, the usual order for hauling down the main-tack. **Haul up**, altering the course more towards the wind. **Hawse-holes**, the openings in the bows through which the cables pass, - the iron lining is the **hawse-pipe**; a large piece of wood which stops the hole at sea is the **hawse-plug**; open **hawse**, when the cables are clear of each other; a **cross**, when the ship has swung half round; an **elbow**, when once round; a **round turn**, when twice round; **in the hawse**, in the space close ahead. **Hawser**, a large rope for moving a ship, now frequently of steel wire. **Head-sails**, the flying-jib, jib, and fore-top-mast stay-sail. **Head sea**, when the waves run contrary to the course though the wind may not be so. **Headway**, motion in the direction of the vessel's head. **Heart**, a block of hard wood, which takes a large rope round it and many turns of a lanyard through it. **Heave down**, to careen for repairs. **Heave in stays**, to come up in the wind for tacking. **Heave short**, to heave in the cable to a short scope. **Heave the lead**, to cast the lead to ascertain the depth. **Heave the log**, to throw the log over to test the speed. **Heel**, the lower part of a mast, spar, rudder, or stern-post. **Heel chain**, from the bowsprit cap to keep the jib-boom out. **Helm's-a-lee**, a word of command implying that the helm is down. **Hog**, to scrub or scrape the bottom. **Hogged**, applied to a vessel when through weakness the bow and stern drop, so that the profile is that of a hog's back (see "broken-backed"). **Home**, when sheets are close down to the yard they are home; when an anchor is hove upon and draws through the ground it is said to come home. **Hoops**, broad wooden bands used with gaff-sails and wind-sails. **Horse**, a bar upon which the fore or main sheet blocks of small vessels run. **Hounds**, large cheeks on a mast to support the trestle-trees. **Housing**, of a mast, the part below the upper-deck. **Hove to**, an abbreviation of **hove to the wind**, to bow the sea; to stop. **Hulk**, an old vessel without masts. **Hull**, the body of the vessel exclusive of masts and rigging. **Hull-down**, so far distant that the hull is below the horizon.

Inboard, any place within the ship. **In irons**, when the sails are so badly arranged that the vessel will not obey the helm. **In the wind**, too close, the sails flapping.

Jack-stay, a tight rope to which others are made fast. **Jacob's ladder**, a rope

¹ See also the explanation to fig. 35 at p. 594.

ladder with wooden steps. *Jaw-rope*, to confine the jaws of a gaff to the mast. *Jears*, a heavy purchase for swaying up the fore and main yards. *Jewel-block*, at the extremity of a yard for the studding-sail halyards. *Jew's harp*, a shackle at the head of an anchor. *Jigger*, a small handy tackle with a double and a single block. *Junk*, old cable or large rope, used for making swabs, mats, spun-yarn, &c. *Jury-mast*, *jury-yard*, *jury-rigger*, temporary substitutes for mast, &c. *Keckle*, to pass old rope round a hemp cable to protect it from chafing. *Kedging*, to move by means of warps and kedg anchors. *Keelson*, a timber inside on top of the keel. *Keep away*, steer farther from the wind. *Keep her full*, the helmsman to keep the sails full of wind. *Keep your luff and keep to the wind*, synonymous expressions. *Kink*, a knotty twist in rope; a bend in wire-rope which is difficult to straighten. *Knees*, angular supports of iron or wood. *Knittle-stuff*, small line made by hardening two or three rope-yarns and twisting them together. *Knot*, a geographical mile (see art. Log).

Lacings, small lines securing sails and other things. *Landfall*, finding the land as expected. *Landlocked*, protected by land in every direction. *Lanyard*, a rope for tightening larger ropes; a line to fasten knives, marling-spikes, &c. *Larboard*, the old name for the left side, now called *port*. *Lash*, to secure two or more things together by ropes. *Lay to*, to wait; to heave to. *Lazy-guy*, a rope or tackle on a spanker-boom or main-boom to keep it steady. *Lead*, the weight for ascertaining the depth of water. *Lead*, the lead of a rope is its proper direction through the blocks. *Leech*, either side of a square sail and the lee-side of all others (see "luff"). *Leech-lines*, on courses only, to haul the leech of the sail close up to the fore-side of the yard. *Lee turch*, a deep roll to leeward. *Lee shore*, a shore upon which the wind blows directly and which is unsheltered. *Lee side*, the side farthest from the wind, either inside or outside the ship. *Under the lee*, a ship is so spoken of in relation to the land by which it is protected; similarly a boat may be said to be "under the lee" of a ship. *Lee-way*, the distance a ship drifts out of her course, indicated by the angle formed by the wake. *Legs*, spars carried by cutters to keep them upright when on the ground. *Life-lines*, small ropes to steady the men when standing on the yards, to hold by when being lowered in boats, and for similar purposes. *Lift*, a rope near the extremity of each yard to top it up, i.e., lift it. *Limers*, boards or plates to keep the bilge clear. *List*, to lean over continuously. *Lizard*, a lanyard with a thimble to confine another rope or to ship at pleasure. *Loose sails*, letting them fall free to dry or for use. *Lubber*, a man not skilled in seamanship. *Lubber's hole*, an open space in the top near the eyes of the rigging, through which a man can crawl instead of going outside. *Luff*, an order to steer closer to the wind; of a sail, the fore-part of a stay-sail, try-sail, or jib, and the weather-side for the time being of any square sail. *Luff-tackle*, is formed of 3-inch or 4-inch rope, a double and a single block, and is used for various temporary purposes.

Make sail, to set sail. *Make water*, to leak. *Manger*, a tight enclosure to catch the water from the hawse-pipes. *Man-rope*, placed over the side at the gangway for people to climb up by, and at other places. *Man yards*, men to stand in a row on each, as a salute. *Marl*, to secure things together by a succession of half-hitches. *Marling*, soft-laid white line for securing sails to the bolt-rope. *Marling-spike*, an iron or copper spike used by sailmakers and riggers. *Marry*, to fit the strands together ready for splicing. *Martingale*, a tackle to keep down a spar. *Maul*, a large double-headed hammer used by riggers. *Messenger*, an endless rope or chain from the capstan to bring in the cable. *Mid-ships*, the centre, or, when applied to the helm, the neutral point. *Miss stays*, to try to tack and fail. *Mooring-sweel*, a swivel with four short legs to meet two cables from the anchors and two bridle from the hawse. *Mouse*, a swelling or obstruction raised on a stay; also a seizing across the point of a hook.

Neap-tide, of a ship, to be in a dock or on shore requiring more water to float than neap-tides afford. *Near*, a caution to the helmsman that the ship is too close to the wind. *Necklace*, a chain or band round a lower mast for the futtock rigging to be set up to, or round the top-mast for the top-gallant rigging to reeve through. *Nip*, the part of the rope which bears the chief strain; to freshen the nip is to veer out and change the place. *Nipper*, a salvagee, rope, or chain for binding the messenger to the cable. *Norman*, a block of wood placed in one of the holes of a capstan for veering a rope by. *Num-buoy*, a buoy of any material in the form of a double cone.

Offing, a distance from the land. *Off the wind*, not so close as she might be if sailing on a wind. *Open*, an anchorage is open when exposed to the sea; the hawse when the cables are clear of each other; an object when visible, not obscured. *Orlop-deck*, the lowest in large ships. *Out of trim*, when the weights are wrongly placed. *Overhaul*, to slacken every part of a tackle; to overtake; to examine.

Painter, the rope by which boats are made fast. *Parbuckle*, to hoist by rolling a thing with two ropes. *Paravelling*, covering a rope with strips of tarred canvas. *Parrels*, stout ropes covered with leather, used to confine an upper yard to the mast. *Parting*, breaking, as parting the cable. *Pay a seam*, filling it with pitch. *Pay away and pay out*, applied to slacking hawsers or cables. *Pay down*, lowering things, as the cable to be coiled or stowed. *Pay off*, from the wind, as by hoisting head-sail or putting the helm up; to pay and dismiss the crew. *Peak*, the outer part of a gaff and of a gaff-sail. *Pendant*, a large rope with a tackle attached. *Pennant*, a narrow signal flag; a long strip flown by ships of war. *Pig*, one part of iron ballast; the largest is 8 cwt. *Pintle*, a large pin bolted to the rudder, by which it is hinged. *Pitching and sending* signifies plunging the bow into one wave and the stern into another. *Plain sail*, all except studding-sails and stay-sails between the masts. *Point*, a plating or line to tie up a reef; to secure the end of a rope with knittles. *Pooped*, a vessel is said to be pooped when a wave breaks over the stern. *Port*, the modern word for left. *Press of sail*, very much sail. *Preventer-brace*, an additional rope to support the yard during a gale. *Prize*, to move by a lever or a spar; a lawful capture. *Purchase*, a tackle or lever.

Quarter, the part of the side near the stern, hence quarter-boat; also the part of a yard between the centre and the yard-arm.

Rack, a frame with sheaves and belaying pins. *Rake*, to fire through a ship from end to end; the inclination of the masts aft. *Range of cable*, it was formerly customary to haul up cable equal to the depth of water. *Rap-full*, the wind acting fully on every sail. *Rattlins* or *rattlings*, small lines as steps up the rigging. *Raze*, a ship reduced in height by one or more decks. *Reach*, the open straight part of a river between two bends. *Ready about*, *ready o' ready*, words of warning preparatory to tacking. *Reef-tackles* and *reef-pendants*, for hauling up the leeches of top-sails and courses ready for reefing; the latter also on a boom for reefing a sail. *Reeving-line*, a small rope rove through blocks to drag a larger one after it. *Reft*, general repair. *Believing tackles*, placed on a tiller to assist the wheel-ropes during a gale. *Rendering*, slipping, not holding as a knot or fastening should. *Ribs and trucks*, flat boards and rollers alternating; used for jaw-ropes and parrels. *Riding between wind and tide*, when balanced between the two. *Riding cable*, the cable bearing the strain. *Rigging stoppers*, for securing the standing rigging when broken. *Right a vessel*, to recover the upright position. *Right the helm*, to relinquish the position the helm is in at any moment and place it in midships. *Ring-ropes*, cable stoppers which pass through the ring-bolts. *Robands*, small tyers to fasten a top-sail or course to a jack-stay. *Rogue's yarn*, a thread of worsted spun in the rope to mark it; each British royal dockyard formerly used a different colour. *Rolling tackle*, stretched from the lee quarter of a yard to the mast, to relieve the parrel or truss from the jerking strain of the lee roll. *Roping*,

the bordering of every sail. *Round down*, to overhaul, to slack by hand. *Rounding*, old 3-inch or 4-inch rope for back purposes. *Round in the weather-braces*, the wind becoming more favourable, to bring the yards nearer to square. *Roundly*, to lower or veer quickly. *Round to*, to come to the wind and heave to. *Round turn*, a double twist in a cable; to veer a rope round a bit-head or cleat. *Round up*, to shorten up a tackle; to pull up a slack rope through a block. *Rouse it in*, as hauling a hawser by hand without a purchase. *Rowlock*, an opening in the gunwale of a boat for an oar. *Rudder chains and pendants*, are shackled to a band on the rudder ready to steer the ship if the rudder-head gives way. *Rudder coat*, canvas or leather round the aperture and rudder-head to exclude the sea. *Runner and tackle*, a long pendant and tackle for staying lower masts; the chief support aft to a cutter's mast. *Running rigging*, that which is rove through blocks, or the heel of the jibboom and the end of the spanker boom. *Sag to leeward*, to make more leeway than headway. *Sail close to the wind*, to sail with the sails barely full. *Sail large or free*, to sail off the wind, as "with a flowing sheet." *Sail tackle*, from the top-mast-head to sway up top-sails and top-sail-yards. *Samson-post*, a strong piece of elm to fit against a beam above it and in a step on the deck. *Scandalize a boom main-sail*, to twice up the tack and drop the peak. *Scope of cable*, the length veered out of the hawse. *Scotchman*, an iron plate to protect a part of the rigging from chafing. *Scudding*, running before a gale either with or without sail; the latter is described as "under bare poles." *Scull*, a small oar. *Sculling*, propelling a boat by moving the flat of the oar over the stern to and fro while changing the angle. *Scupper*, a passage for water to run off a deck. *Scuttle*, a hole in the side to admit light and air; a hole made in the side or deck to let water flow in. *Sea*, a wave; a long sea or a short sea has reference to the distance between the waves. *Sea-boat*, a vessel is said to be a good or bad sea-boat according as she behaves in a gale. *Sea-room*, free from land or shoals. *Seizing*, a small lashing. *Selvaage*, a strap made of yarns or small rope wound as a skein and marled together. *Sending*, see "pitching." *Sennit*, a plating of three or more rope-yarns. *Serving*, covering a rope closely with spun-yarn, hove on by a serving mallet. *Set up*, applied to standing rigging to make it tight. *Setting-flid*, a large cone of wood used in fitting rigging. *Sewed*, to be lifted out of the water, as by running on a ledge, or being left by the tide. *Shackle*, a curved bar, with two eyes and a bolt, for joining chains. *Shank-painter*, a stopper which holds up the fluke of an anchor at the bows. *Shape a course*, to steer in the desired direction, the wind favouring. *Shear-hulk*, a vessel fitted permanently with shears. *Shears*, two large spars with their heads lashed and heels spread, for masting ships and lifting heavy weights. *Sheave*, a wheel of brass or lignum vitae for ropes to travel on; all the fakes of a coil of rope to complete a layer. *Sheer*, to swerve from the course, the curve formed by the bow and stern being higher than the centre. *Sheer-batten*, a bar of iron to keep the dead-eyes square. *Sheer off*, to edge away. *Sheet*, the rope which holds the lee lower corner of a sail. *Sheet-anchor*, one of the largest, and the third for use. *Sheet home*, to haul the sheets of square sails to their positions. *Shift the helm*, put it over the other way. *Shipped*, taken on board; anything fixed in its place for use. *Shipshape*, in a proper and seamanlike manner. *Shiner a sail*, to make it shake and render it neutral. *Shoot*, to go ahead after the propulsion has ceased. *Shorten sail*, to take in some portion. *Skid*, a spar for something to rest or slide upon. *Skin of a sail*, the part exposed when it is furled. *Skipper*, the old name for the master of a small vessel. *Slab of a sail*, the slack part which hangs down after the leech-lines are hauled up. *Sleepers*, timbers in the hold and strengthening pieces in the tops. *Slew*, to turn or cant over. *Slips*, ropes with toggles, shackles, and tongues, and various contrivances for letting go quickly. *Small helm*, when the sails are well balanced and the rudder but little used. *Small sail*, and *snug sail*, low and reduced, ready for bad weather. *Sound*, to ascertain the depth of the sea, or of water in the pump-well. *Span*, two parts of a rope spread to divide the strain, or for making a point secure in an intermediate place. *Spanish windlass*, a bar of iron and two marling-spikes to heave seizings taut; tightening ropes by twisting them together by a lever. *Spell*, a turn or relief. *Spider*, a small iron outrigger, to keep the main-brace block clear of the counter. *Spilling-lines*, ropes passed round a part of a sail which is flapping, to confine it. *Spitfire-jib*, a small storm-sail used in cutters. *Splice*, to join two ropes by entwining the strands. *Splice the main-brace*, to give a glass of grog to every man after some unusual fatigue, or on some occasion of rejoicing. *Splicing-tails*, a short piece of chain with three tapering tails, for splicing to a hemp cable. *Spring*, a hawser from the after-part to cant the ship. *Spring a leak*, to cause a leak by straining. *Sprit-sail*, formerly set on the sprit-sail-yard; an efficient four-sided sail for boats and barges, the peak of which is held up by a spar called a *sprit*. *Sprung*, cracked, fractured. *Spun-yarn*, rope-yarns laid up together softly. *Square-rigged*, having yards and square sails, as ships and brigs have. *Square sails*, those set upon such yards as have lifts and braces, regardless of their proportions. *Square yards*, to adjust them by means of their lifts and braces. *Stand by a rope*, to be in readiness to let it go. *Standing off and on*, sailing to and fro, as off a port. *Standing part*, the fixed end of a running rope. *Standing rigging*, such as shrouds and stays. *Stand on*, to continue the same progress and course. *Starboard*, the right-hand side. *Starboard and port tack* express the direction of the wind, on the right hand and on the left respectively. *Stay-sails*, any sail set on a stay, except the jib, flying-jib, and fore-sails of cutters and schooners. *Steady*, to the helm; to keep the same course. *Steadying-lines*, passed from eye-bolts in the gunnel of a boat to the slings to keep it upright. *Steeve*, the angle which the bowsprit forms with the horizon. *Stem on*, striking head foremost at right angles, the reverse of *stern on*. *Stern-board*, having considerable stern-way. *Stevadore*, see "estivador." *Stiffness*, stability under canvas. *Stirrapp*, a short rope from a yard to support a foot-rope. *Stop*, a light temporary seizing. *Storm-sails*, stay-sails and try-sails of the strongest canvas. *Stranded*, when one strand is broken; wrecked on a beach. *Stream-anchor*, about one-third to one-fourth the weight of a bower anchor. *Stream the buoy*, to throw over the buoy which is to watch over the anchor. *Strike*, to send down from aloft. *Strike colours*, a token of submission. *Strike soundings*, to succeed in reaching the bottom with the lead. *Studding-sails*, light four-sided sails set only with a fair wind. *Surge*, to slack back quickly, as a hawser round a capstan, to make it slip up to its place. *Swab*, a large bundle of rope-yarns for soaking up water; a drunkard. *Sway away*, to hoist by running with a rope. *Sweep*, a large oar; to search the bottom with a hawser or chain. *Swifter*, a single shroud, when there is an odd one; to draw rigging together; a rope or bar to keep things equidistant, or in their proper places. *Swinging*, the act of turning to the change of wind and tide. *Swinging boom*, a large spar for spreading the foot of the lower studding-sail; in harbour for making boats fast.

Tabernacle, a frame for receiving the heel of a boat's mast to make it higher Tack, the lower weather corner of every sail; to change course by bringing the wind ahead and round to the other side. *Taken aboard*, applied to a vessel when the wind coming ahead reverses the action of all the sails. *Taking in sail*, cleaving it up and perhaps furling it. *Tavut*, high masts, comparatively. *Taut* (also *taught*), the only word among seamen to signify tight. *Tending to the tide*, beginning to swing to the change of tide in opposition to the wind. *Thimble*, an iron ring with a score to receive a rope; *union thimble*, two thimbles welded within each other. *Thole pin*, a peg of wood on the gunwale of a boat to confine the oar. *Thorough-foot*, the fall of a tackle being foul,

requiring to be unrove or the block turned over between the parts. *Three sheets in the wind*, a ship too close to the wind; a man half drunk. *Throat*, the upper corner of a gaff-sail nearest the mast. *Throat halyards*, for hoisting the end of the gaff nearest the mast. *Thwart*, across; the name of all seats which cross a boat. *Thwart ships*, across the ship. *Tide-way*, an anchorage or position affected by tide. *Tiller*, a lever which moves the rudder. *Toggles*, pieces of wood varying in shape, generally secured to one piece of rope so as to hold the eye of another, as a button. *Top*, a large platform resting on the cross-trees of each lower mast; to top a yard is to raise it by the lift. *Top-rope*, a large rope rove through the heel of the top-mast. *Tow*, one vessel pulling another in any relative position. *Transport a ship*, to move her in a harbour by ropes. *Traveller*, an iron ring covered with leather, for jibs, royals, and boat sails. *Travelling backstay*, a support to the top-mast always close above the yard. *Traverse*, to make several tacks; the free motion of a sheave or rope. *Trestle-trees*, pieces of wood which rest on the hounds of the mast and support the cross-trees. *Tricing-line*, a small rope used for hoisting up a tackle or larger rope. *Trim of the ship*, neither too deep nor too light, and having the right draught of water forward and aft. *Trim sails*, to brace the yards and adjust the sheets. *Trip*, the anchor is tripped when the shank is raised and the flukes broken out of the ground. *Trough of the sea*, the hollow between long waves, which are generally nearly parallel. *Truck*, a disk of wood at the summit of the mast, generally having sheaves for signal halyards; a long wooden fair lead seized to the shroud. *Trusses*, fitted variously to confine the centre of the lower yards to the mast. *Try-sail*, a foul-weather gaff-sail. *Try-sail-mast*, a smooth spar abaft each mast to support the jaws of the gaff and luff of the sail. *Turning in a dead-eye*, fitting the shroud or stay round it. *Turning to windward*, tacking frequently. *Twice laid*, rope that has been unlaid and re-twisted to the desired size. *Twiddling-lines*, for securing the wheel when not in use. *Two blocks*, signifying that the two ends of a purchase have come together. *Tye*, a large rope on which the halyards act when hoisting a yard. *Under foot*, said of an anchor when dropped without veering more cable. *Under sail*, free from moorings and propelled by sail only. *Under steam*, propelled by steam only. *Under way*, having motion; the anchor off the ground.

Vangs, ropes to steady a gaff. *Veer*, to slack out cable, hawser, or tow-rope; the old expression for "wear." *Veer and haul*, slacking and hauling alternately, by a number of men simultaneously, so as to gain by the jerk.

Waist, the centre part of the ship before the gangway port. *Wake*, the track left in the water. *Warp*, a small hawser for moving the ship; yarns or rope stretched over pins for making straps. *Warping-buoys*, buoys moored in suitable positions for ships to warp by, now rendered nearly obsolete by the use of steam-tugs. *Watch*, sailors' watches commence or terminate at 4, 8, and 12 o'clock, also at 6 P.M.; a buoy over an anchor is said to watch while it floats and can be seen. *Water-dorne*, to be entirely aloft. *Water-logged*, full of water, unmanageable. *Way*, motion, as under way, headway, sternway. *Wear ship*, to bring the wind on the other side by first running before it. *Weather-bound*, detained by contrary winds or bad weather. *Weather-gage*, being to windward of the enemy. *Weatherly*, sailing well, without much leeway. *Weather-side*, that on which the wind blows. *Weather-tide*, the stream running contrary to the direction of the wind. *Wedging a mast*, securing it in the partners or frame on each deck by wedges made to fit. *Weigh*, to heave up the anchor. *Whip*, a single rope passing through a block. *Whipping*, a light seizing of twine at the end of a rope to prevent fraying. *Whiskers*, projections from the cat-head to spread the jib-guys. *Wind a ship or boat*, to turn her head where her stern was. *To take the wind out of another's sails*, to pass close to windward, as yachts sometimes do. *Windlass*, a machine for heaving in cable. *Wind-rod*, being head to wind though in a tide-way. *Wind-sail*, a canvas ventilator. *Wood-lock*, a chock to keep the rudder in its place. *Woodlashing*, a stout lashing to secure sprung or fished spars. *Work a ship*, to perform every manœuvre. *Worm*, to heave small line between the strands of a rope to make it smooth.

Yard, a spar which spreads a sail. *Yard-rope*, a rope by which a top-gallant or royal yard is sent up from the deck, and afterwards becomes the tye and halyards. *Yard-tackles*, permanently on the lower yard-arms of large ships for hoisting in things and as preventer braces. *Yaw*, an involuntary deviation from the course. *Yoke*, a bent lever across the ship or boat which acts as a tiller.¹ (H. A. M.)

SEAMEN, LAWS RELATING TO. In most legal systems legislation has interfered to protect the seaman from the consequences of that imprudence which is generally supposed to be one of his distinguishing characteristics. In the United Kingdom there has been a very large amount of legislation dealing with the interests of seamen with unusual fulness of detail, proving the care bestowed by a maritime power upon those to whom its commercial success is so largely due. How far this legislation has had the efficiency which was expected may be doubtful. The loss of life among sailors was one in eighty in 1871, one in seventy-five in 1882. There has been besides a steady diminution in the number of British seamen employed on British ships, nearly one-eighth being foreigners at the present time.

For legislative purposes seamen may be divided into three classes, seamen in the royal navy, merchant seamen, and fishermen.

Seamen in the Royal Navy.—It is still lawful to impress men for the naval service, subject to certain exemptions (13 Geo. II. c. 17). Among the persons exempt are seamen in the merchant service. In cases of emergency officers and men of the coastguard and revenue cruisers, seamen riggers, and pensioners may be required to serve in the navy (16 and 17 Vict. c. 73). There appears to be no other instance (now that balloting for the militia is suspended) where a subject may be forced into the service of the crown against his will. The navy is, however, at the present day wholly recruited by voluntary enlistment. The navy estimates of 1885 provided for 59,000 men (see NAVY). Special advantages are afforded by the Merchant Shipping Act, 1854, to merchant seamen enlisting in the navy. They are enabled to leave their ship without punishment or forfeiture in order to join the naval service. The discipline of the navy is, unlike that of the army, for which an annual Army Act is necessary, regulated by a permanent Act of Parliament, that now in force being the Naval Discipline Act, 1866. In addition to numerous hospitals and infirmaries in the United Kingdom and abroad, the great charity of Greenwich Hospital is a mode of provision for old and disabled seamen in the navy (see GREENWICH). At present such seamen are out-pensioners only; the hospital has been for some years used as the Royal Naval College for officer students. The enactments of the Merchant Shipping Act, 1854, as to savings banks were extended to seamen in the navy by 18 and 19 Vict. c. 91, s. 17. Enlistment without the licence of the crown in the naval service of a foreign state at war with another foreign state that is at peace with the United Kingdom is an offence punishable under the Foreign Enlistment Act, 1870. Any person buying from a seaman or enticing a seaman to sell Government property is liable to penalties under the Seamen's Clothing Act, 1869.

Merchant Seamen.—Most of the Acts dealing with this subject, commencing with 8 Eliz. c. 13, were repealed by 17 and 18 Vict. c. 120, after having been consolidated and extended by the Merchant Shipping Act, 1854 (17 and 18 Vict. c. 104). The main part of the legislation affecting seamen in the merchant service occurs in the third part of this Act. Since 1854 numerous amending

Acts have been passed, amounting to no less than eleven in number. They are cited collectively as "The Merchant Shipping Acts, 1854 to 1883." The enactment of a new consolidation Act is urgently required, and can be only a question of time. The Merchant Shipping Act, 1854, defines a seaman to be "every person (except masters, pilots, and apprentices duly indentured and registered) employed or engaged in any capacity on board any ship" (s. 2). It should be noticed that most of the enactments relating to merchant seamen do not affect seamen employed on foreign vessels, on fishing boats on the coasts of the United Kingdom, on vessels belonging to the Trinity House, the Commissioners of Northern Lighthouses, and the port of Dublin corporation, and on pleasure yachts. The principal provisions of the Merchant Shipping Acts dealing with seamen are as follows. Where no other reference is given, the Act of 1854 is intended. An elective local marine board under the general supervision of the Board of Trade is appointed in the principal ports of the United Kingdom. One of the duties of the board is the establishment of mercantile marine offices under superintendents or deputy superintendents.² It is the general business of such officers to afford facilities for engaging seamen by keeping registries of their names and characters, to superintend and facilitate their engagement and discharge, to provide means for securing the presence on board at the proper times of men who are so engaged, and to facilitate the making of apprenticeships to the sea service (s. 124). A seaman must be hired before a superintendent or deputy superintendent, an officer of customs, or a consular officer on a form sanctioned by the Board of Trade (usually called the shipping articles) containing the following particulars:—(1) the nature and, as far as practicable, the duration of the intended voyage or engagement, or the maximum period of the voyage or engagement, and the places or parts of the world (if any) to which the voyage or engagement is not to extend; (2) the number and description of the crew, specifying how many are employed as sailors; (3) the time at which each seaman is to be on board or to begin work; (4) the capacity in which each seaman is to serve; (5) the amount of wages which each seaman is to receive; (6) a scale of the provisions which are to be furnished to each seaman; (7) any regulations as to conduct on board and as to fines, short allowance of provisions, or other lawful punishments for misconduct, which have been sanctioned by the Board of Trade as regulations proper to be adopted, and which the parties agree to adopt. Every agreement is to be framed so as to admit of stipulations as to allotment of wages, and may contain any other stipulations not contrary to law (s. 149, as amended by the Act of 1873 and the Merchant Seamen Act, 1880). Among illegal stipulations would fall any agreement by a seaman to give up his right to salvage, to forfeit his lien on the ship, or to be deprived of any remedy for the recovery of wages to which he would otherwise have been entitled (s. 182). In the case of foreign-going ships the following rules in addition must be observed:—(1) every agreement made in the United Kingdom (except agreements with substitutes) is to be signed by each seaman in the presence of the superintendent of a mercantile marine office; (2) the superintendent is to cause the agreement to be read over and explained to

¹ For a fuller explanation of some of these terms, see Vice-Admiral W. H. Smyth, *The Sailor's Word Book of Nautical Terms*; Falconer's *Marine Dictionary*, enlarged by W. Burney; F. L. Breslau, *Illustrated Nautical Polyglot* (six languages).

² These offices and officers were called shipping offices and shipping masters in the Act of 1854. The names were changed to the longer and less convenient ones in the text by the Act of 1862 (25 and 26 Vict. c. 63, s. 15).

each seaman, or otherwise to ascertain that each seaman understands the same before he signs it, and is to attest each signature; (3) the agreement is to be in duplicate, one part to be retained by the superintendent, the other by the master; (4) in the case of substitutes, they are where possible to be engaged before a superintendent, in other cases the agreement is to be read over and explained to the seaman by the master and signed by the seaman in the presence of a witness (s. 150). The only cases where no agreement in writing is necessary is where the hiring is for a coaster of less than eighty tons register or for a foreign vessel. In the case of union apprentices the indentures must be executed in the presence of and attested by two justices. No stamp duty is chargeable on indentures for the sea service. In the case of foreign-going ships making voyages averaging less than six months in duration, running agreements with the crew may be made (s. 151). No person unlicensed by the Board of Trade, other than a master or mate or agent of the owner, may engage or supply seamen. The discharge of a seaman, like his engagement, must take place before a superintendent or an officer of equivalent authority. The seaman is entitled to receive a certificate of service and discharge. His wages must be paid within a limited time from his discharge, varying according to circumstances, and are not now dependent, as they were at common law, upon the earning of freight. If he is discharged before a month's wages are earned, he is entitled to a month's wages. As far as possible, payment is to be made in money and not by bill. In the absence of special stipulations, wages are not generally due until the contract of service is complete. By 8 Geo. I. c. 24, s. 7, a master may not advance a seaman more than half his wages while abroad. Sums recoverable as wages are, in addition to wages properly so called, the expenses of subsistence and of the voyage home when a ship is sold or transferred abroad, and the master does not deposit with a consular officer a sufficient sum for the seaman's expenses pursuant to s. 205; the expenses of a seaman left behind or discharged from a British ship, or a British subject from a foreign ship, out of the United Kingdom; allowance for short or bad provisions; the moneys and effects of a deceased seaman who has been employed on a British ship; expenses caused by illness from want of proper food and accommodation and medicines; and double pay for every day, not exceeding ten, during which payment of wages is delayed without proper cause. Wages cannot be attached. They may be forfeited or reduced by desertion, wilful disobedience, smuggling, want of exertion in case of wreck, illness caused by neglect or default of the seaman, and misconduct of other kinds. Advance notes—that is, documents promising the future payment of money on account of a seaman's wages conditionally on his going to sea and made before the wages have been earned—are void, and no money paid in respect of an advance note can be deducted from the wages earned. Merchant Seamen (Payment of Wages and Rating) Act, 1880 (43 and 44 Vict. c. 16, s. 2). Allotment notes may be made in the form sanctioned by the Board of Trade, and may stipulate for the allotment of not more than half the seaman's wages in favour of a wife, parent, grandparent, child, grandchild, brother or sister (s. 169), or of a savings bank (43 and 44 Vict. c. 16, s. 3). Seamen's savings banks have been established and are administered by the Board of Trade, chiefly under the powers given by the Seamen's Savings Banks Act, 1856. If during the absence of a seaman on a voyage his wife and family become chargeable to the parish, two-thirds of his wages at the most are all that can be recovered by the parish. Careful provision is made for the custody of a deceased seaman's effects and wages, and their delivery to his representatives. The possibility of a seaman's being left destitute abroad is provided against by ss. 206, 207. Consular officers abroad are bound to send home any distressed or shipwrecked seaman, the expenses being chargeable upon the mercantile marine fund. Compensation is to be made for insufficiency or bad quality of provisions or water on board. If a complaint of the quality or sufficiency be frivolous, the persons complaining are liable to forfeit a week's wages. All foreign-going ships are to carry proper medicines and medical stores. Lime and lemon juice and other antiscorbutics are to be provided on ships bound to foreign ports other than ports in Europe and the north of North America. An ounce a day of lime or lemon juice is to be served to each member of the crew after the ship has been at sea for ten days (Act of 1867, 30 and 31 Vict. c. 124, s. 4). A foreign-going ship having one hundred persons or upwards on board must carry a qualified medical man (s. 130). Each seaman or apprentice is entitled to a space of not less than 72 cubic feet, the place to be securely constructed, properly lighted and ventilated, and properly protected from weather and sea, and as far as possible from effluvia caused by cargo or bilge-water. The place is to be inspected and certified by a surveyor of the Board of Trade, and to be kept free from goods and stores. The local marine board (or the Board of Trade where there is no local marine board) may appoint a medical inspector of seamen, who may on application by the master or owner report to the superintendent of the mercantile marine office as to whether any seaman is fit for duty (80 and 31 Vict. c. 124, ss. 9, 10).

Bye-laws and regulations relating to seamen's lodging-houses may be made by the sanitary authority of any seaport town with the sanction of the president of the Board of Trade. Such bye-laws and regulations are to provide for the licensing of seamen's lodging-houses, the inspection of the same, the sanitary conditions of the same, the publication of the fact of a house being licensed, the due execution of the bye-laws and regulations and the non-obstruction of persons engaged in securing such execution, the preventing of persons not duly licensed holding themselves out as keeping or purporting to keep licensed houses, and the exclusion from licensed houses of persons of improper character (46 and 47 Vict. c. 41, s. 48). Provision is made for the protection of seamen from imposition by crimps and lodging-house keepers. This protection may in certain cases be extended by order in council to foreign ships (s. 237, and 43 and 44 Vict. c. 16, ss. 5, 6). At the time of discharge of the crew in the United Kingdom a list in the form sanctioned by the Board of Trade is to be made out and delivered to a superintendent of a mercantile marine office containing, *inter alia*, the following particulars:—(1) the number and date of the ship's register and her registered tonnage; (2) the length and general nature of the voyage or employment; (3) the Christian names, surnames, ages, and places of birth of all the crew, including the master and apprentices, their qualities on board, their last ships or other employments, and the dates and places of their joining the ship; (4) the names of any members of the crew who have been maimed or hurt, with the times, places, causes, and circumstances thereof; (5) the wages due at the time of their respective deaths to any of the crew who have died; (6) the clothes and other effects belonging to any of the crew who have died, with a statement of the manner in which they have been dealt with, and the money for which any of them have been sold (s. 273). Every birth or death occurring at sea is to be recorded in the log-book and reported on arrival at any port in the United Kingdom to the registrar-general of shipping and seamen, who forwards a certified copy to the registrar-general of births and deaths (37 and 38 Vict. c. 88, s. 37). An official log-book in a form sanctioned by the Board of Trade is to be kept by the master of every ship except a coaster. It must contain, *inter alia*, (1) every legal conviction of any member of his crew and the punishment inflicted; (2) every offence committed by any member of his crew for which it is intended to prosecute, or to enforce a forfeiture, or to exact a fine, together with a statement concerning the reading over of such entry and concerning the reply (if any) made to the charge; (3) every offence for which punishment is inflicted on board, and the punishment inflicted; (4) a statement of the conduct, character, and qualifications of each of his crew, or a statement that he declines to give an opinion on such particulars; (5) every case of illness or injury happening to any member of the crew, with the nature thereof and the medical treatment adopted (if any); (6) the name of every seaman or apprentice who ceases to be a member of the crew, otherwise than by death, with the time, place, manner, and cause thereof; (7) the amount of wages due to any seaman who enters Her Majesty's service during the voyage; (8) the wages due to any seaman or apprentice who dies during the voyage, and the gross amount of all deductions to be made therefrom; (9) the sale of the effects of any seaman or apprentice who dies during the voyage, including a statement of each article sold and of the sum received for it (s. 282). At common law there was no obligation of the owner to provide a seaworthy ship, but by the Act of 1876 every person who sends or attempts to send, or is party to sending or attempting to send, a British ship to sea in such unseaworthy state that the life of any person is likely to be thereby endangered is guilty of a misdemeanour, unless he proves that he used all reasonable means to insure her being sent to sea in a seaworthy state, or that her going to sea in such unseaworthy state was under the circumstances reasonable and justifiable. A master knowingly taking a British ship to sea in such unseaworthy state that the life of any person is likely to be thereby endangered is guilty of a misdemeanour. In every contract of service between the owner and the master or any seaman and in every indenture of sea apprenticeship, an obligation is implied that the owner, master, and agent shall use all reasonable means to insure the seaworthiness of the ship (39 and 40 Vict. c. 80, ss. 4, 5). A return of certain particulars, such as lists of crews and of distressed seamen sent home from abroad, reports on discharge, births and deaths at sea, must be made to the registrar-general of shipping and seamen, an officer of the Board of Trade. The seaman is privileged in the matter of wills (see WILL), and is exempt from serving in the militia (42 Geo. III. c. 90, s. 43). Assaults upon seamen with intent to prevent them working at their occupation are punishable summarily by 24 and 25 Vict. c. 100, s. 40. There are special enactments in favour of Lascars and foreign seamen on British ships (see 4 Geo. IV. c. 80; 17 and 18 Vict. c. 104, s. 544; 17 and 18 Vict. c. 120, s. 16; 18 and 19 Vict. c. 91, s. 16). In addition to this legislation directly in his interest, the seaman is indirectly protected by the provisions of the Merchant Shipping Acts requiring the possession of certificates of competence by ships' officers, the periodical survey of ships by the Board of Trade, and the enactments against deck cargoes and overloading, as well as by

other Acts, such as the Chain Cables and Anchors Acts, enforcing a minimum strength of cables and anchors, and the Passenger Acts, under which a proper supply of life-boats and life-buoys must be provided. The duties of the seamen appear to be to obey the master in all lawful matters relating to the navigation of the ship and to resist enemies, to encourage him in which he may become entitled to prize money under 22 and 23 Car. II. c. 11 (see PRIZE). Any services beyond these would fall under the head of salvage service and be recompensed accordingly. There are certain offences for which the seaman is liable to be summarily punished under the Act of 1854. They comprise desertion, neglect or refusal to join his ship or absence without leave, quitting the ship without leave before she is placed in security, wilful disobedience to a lawful command, either on one occasion or continued, assault upon a master or mate, combining to disobey lawful commands or to neglect duty or to impede the navigation of the ship or the progress of the voyage, wilful damage to the ship, or embezzlement of or wilful damage to her stores or cargo, and smuggling. The punishment varies from forfeiture of all or part of his wages to twelve weeks' imprisonment (s. 243, as amended by the Merchant Seamen Act, 1880). A master, seaman, or apprentice who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness, does any act tending to the immediate loss, destruction, or serious damage of the ship or to immediately endanger the life or limb of any person belonging to or on board of the ship, or who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness refuses or omits to do any lawful act proper and requisite to be done by him for preserving the ship from immediate loss, destruction, or serious damage, or for preserving any person belonging to or on board of the ship from immediate danger to life or limb, is guilty of a misdemeanour (s. 239). A seaman is also punishable at common law for piracy and by statute for piracy and offences against the Slave Trade Acts. A riotous assembly of seamen to prevent the loading or unloading of any ship or to prevent others from working is an offence under 33 Geo. III. c. 67 (see RIOT). Deserters from Portuguese ships are punishable by 12 and 13 Vict. c. 25, and from any foreign ship by 15 and 16 Vict. c. 26, of course by virtue of conventions with Portugal and other foreign powers. The rating of seamen is now regulated by the Merchant Seamen Act, 1880. By that Act a seaman is not entitled to the rating of "A.B." unless he has served four years before the mast, or three years or more in a registered decked fishing vessel and one year at sea in a trading vessel (43 and 44 Vict. c. 16, s. 7). The Act of 1854 enabled contributions to seamen's refuges and hospitals to be charged upon the mercantile marine fund. As a matter of fact, however, there appears to be no grant in support of seamen's hospitals out of any public funds. The principal seamen's hospital is that at Greenwich, established in 1821 and incorporated by 3 and 4 Will. IV. c. 9 under the name of "The Seaman's Hospital Society." Up to 1870 this hospital occupied the old "Dreadnought" at Greenwich, but in that year it obtained the old infirmary of Greenwich Hospital from the admiralty at a nominal rent, in return for which a certain number of beds are to be at the disposal of the admiralty. The hospital is supported by voluntary contributions, including those of many foreign Governments, and has between its foundation and the end of 1884 relieved no less than 253,629 seamen of all nations. There is also a dispensary for seamen at the London Docks, and a floating hospital at Cardiff, equally supported by voluntary contributions. At one time there was an enforced contribution of sixpence a month from the pay of masters and seamen towards the funds of Greenwich Hospital, levied under the powers of some of the Greenwich Hospital Acts. The payment of these contributions enabled them to receive annuities from the funds of the hospital. These "Greenwich Hospital sixpences," however, became the source of very considerable irritation and have now been discontinued. In their place a purely voluntary seamen's provident fund has been established, its object being to persuade seamen to subscribe sixpence a month towards the seamen's hospital.

The remedies of the seaman for wages are an ordinary action in the Queen's Bench Division or plaint in a county court, an action *in rem* or *in personam* in the Admiralty Division of the High Court (in Scotland in the Court of Session), a Vice-Admiralty Court, or a county court having admiralty jurisdiction, or summary proceedings before justices, naval courts, or superintendents of mercantile marine offices. The master has now the same remedies as the seaman for his wages, under which are included all disbursements made on account of the ship. At common law he had only a personal action against the owner. He has the additional advantage of being able to insure his wages, which a seaman cannot do. A common law action for wages is seldom brought, the statutory remedies being more convenient. By the Admiralty Court Act, 1861, the High Court of Justice (Admiralty Division) has jurisdiction over any claim by a seaman of any ship for wages earned by him on board the ship, whether the same be due under a special contract or otherwise (24 Vict. c. 10, s. 10). This section has been liberally construed and held to apply to such persons as a surgeon, purser, pilot, carpenter, and steward. The court can entertain

claims by foreign seamen against a foreign ship, on notice being given to the consul of the foreign country. If he protest, the court has a discretion to determine whether the action shall proceed or not. A claim for wages in the High Court must be brought within six years (4 and 5 Anne, c. 3, s. 17). The Vice-Admiralty Court Act, 1863, gives jurisdiction in claims for wages irrespective of amount to vice-admiralty courts. A county court having admiralty jurisdiction may entertain claims for wages where the amount claimed does not exceed £150 (31 and 32 Vict. c. 71, s. 3). The jurisdiction of the inferior court is protected by the proviso that, if the action be brought in the High Court for a claim not exceeding £150, the plaintiff may be condemned in costs, and will not be entitled to costs if he recover less than this sum, unless the judge certifies that it was a proper case to be heard in the High Court (s. 9). In actions in all courts of admiralty jurisdiction the seaman has a maritime lien on the ship and freight, ranking next after claims for salvage and damage. The amount recoverable summarily before justices is limited to £50. Orders may be enforced by distress of the ship and her tackle. Proceedings must be taken within six months. A naval court on a foreign station may determine questions as to wages without limit of amount. As a rule a seaman cannot sue abroad for wages due for a voyage to terminate in the United Kingdom. The superintendent of a mercantile marine office has power to decide any question whatever between a master or owner and any of his crew which both parties in writing agree to submit to him. These summary remedies are all given by the Act of 1854. The Merchant Seamen Act, 1880, further provides that, where a question as to wages is raised before a superintendent, if the amount in question does not exceed £5, the superintendent may adjudicate finally, unless he is of opinion that a court of law ought to decide it. The same Act extends the provisions of the Employers and Workmen Act, 1875, to seamen. The Act of 1875 itself specially excluded them. A county court or court of summary jurisdiction (the latter limited to claims not exceeding £10) may under the Act of 1875 determine all disputes between an employer and workman arising out of their relation as such. The jurisdiction of courts of summary jurisdiction is protected by the enactment of the Act of 1854 that no proceeding for the recovery of wages under £50 is to be instituted in a superior court unless either the owner of the ship is bankrupt, or the ship is under arrest or sold by the authority of such court, or the justices refer the case to such court, or neither owner nor master is or resides within 20 miles of the place where the seaman is put ashore (s. 189). It should be noticed that claims upon allotment notes may be brought in all county courts and before justices without any limit as to amount (s. 169). In Scotland the sheriff court has concurrent jurisdiction with justices in claims for wages and upon allotment notes.¹

Fishermen.—The regulations respecting fishermen are contained chiefly in the Sea Fisheries Acts, 1868 and 1883, and in the Merchant Shipping (Fishing-Boats) Act, 1883. The Sea Fisheries Act of 1868 constituted a registry of fishing-boats, and that of 1883 gave powers of enforcing the provisions of the Acts to sea-fishery officers. The Merchant Shipping (Fishing-Boats) Act was passed in consequence of the occurrence of some cases of barbarous treatment of boys by the skippers of North Sea trawlers. The Act provides, *inter alia*, that indentures of apprenticeship are to be in a certain form and entered into before a superintendent of a mercantile marine office, that no boy under thirteen is to be employed in sea-fishery, that agreements with seamen on a fishing-boat are to contain the same particulars as those with merchant seamen, that running agreements may be made in the case of short voyages, that reports of the names of the crew are to be sent to a superintendent of a mercantile marine office, and that accounts of wages and certificates of discharge are to be given to seamen. No fishing-boat is to go to sea without a duly certified skipper. Provision is also made for special reports of cases of death, injury, ill-treatment, or punishment of any of the crew, and for inquiry into the cause of such death, &c. Disputes between skippers or owners and seamen are to be determined at request of any of the parties concerned by a superintendent. For special privileges of fishermen in the use of the seashore, see RIPARIAN LAWS. They are also exempt from Trinity House dues. There are numerous police provisions contained in various Acts of Parliament dealing with the breach of fishery regulations. These provisions act as an indirect protection to honest fishermen in their employment. The rights of British fishermen in foreign waters and foreign fishermen in British waters are in many cases regulated by treaty, generally confirmed in the United Kingdom by Act of Parliament. A royal fund for widows and orphans of fishermen has recently been formed, the nucleus of the fund being part of the profits of the Fisheries Exhibition held in London in 1883.

United States.—The law of the United States is in general accord-

¹ See the works on merchant shipping, such as those of Abbott, MacLachlan, Maude and Pollock; Roscoe, *Admiralty Law and Practice*; Williams and Bruce, *Admiralty Practice*; also Roscoe, *Modern Legislation for Seamen and for Safety at Sea*, 1885.

ance with that of England. The law relating to seamen in the navy will be found in the articles for the government of the navy (*Revised Statutes*, s. 1624). Legislation in the interests of merchant seamen dates from 1790. A list of the crew must be delivered to a collector of customs. The shipping articles are the same as those in use in the United Kingdom. For vessels in the coasting trade they are, with certain exceptions, to be in writing or in print. They must in the case of foreign-bound ships be signed before a shipping commissioner appointed by the circuit court or a collector of customs, or (if entered into abroad) a consular officer, where practicable, and must be acknowledged by his signature in a prescribed form. One-third of a seaman's wages earned up to that time is due at every port where the ship unloads and delivers her cargo before the voyage is ended. They must be fully paid in gold or its equivalent within twenty days of the discharge of the cargo. Advance notes can be made only in favour of the seaman himself or his wife or mother. There is a summary remedy for wages before a district court, a justice of the peace, or a commissioner of a district court. A shipping commissioner may act as arbitrator by written consent of the parties. Seaworthiness is an implied condition of the hiring. There may be an examination of the ship on the complaint of the mate and a majority of the crew. The expenses of an unnecessary investigation are a charge upon the wages of those who complain. A seaman may not leave his ship without the consent of the master. For foreign-bound voyages a medicine-chest and antiscorbutics must be carried, also 60 gallons of water, 100 lb of salted meat, and 100 lb of wholesome bread for every person on board, and for every seaman at least one suit of woollen clothing, and fuel for the fire of the seaman's room. An assessment of forty cents per month per seaman is levied on every vessel arriving from a foreign port and on every registered coasting vessel in aid of the fund for the relief of sick and disabled seamen. In the navy a deduction of twenty cents per month from each man's pay is made for the same purpose. The offences and punishments are similar to those in the United Kingdom. There is also the additional offence of wearing a sheath knife on shipboard.¹ (J. Wt.)

SEARCH, RIGHT OF. "The right of visiting and searching ships on the high seas," says Lord Stowell, "whatever be the ships, whatever be the cargoes, whatever be the destinations, is an incontestible right of the lawfully commissioned ship of a belligerent nation; because till they are visited and searched it does not appear what the ships or the cargoes or the destinations are; and it is for the purpose of ascertaining these points that the necessity of this right of visitation and search exists. This right is so clear in principle that no man can deny it who admits the right of maritime capture, because if you are not at liberty to ascertain by sufficient enquiry whether there is property which can be legally captured, it is impossible to capture" ("The Maria," 1 C. Robinson's *Reports*, 36). This right of search or visitation and search has not been at all times recognized. The second armed neutrality of the Baltic powers in 1800 attempted to withdraw their vessels from the right. The bombardment of Copenhagen in 1801 was one of the results of this policy. Since the convention which followed that event the right has been regarded as established within proper limits, and is often regulated by treaty, especially as to the search of vessels suspected of being engaged in the slave trade. Apart from treaty, the main rules which govern the right are these. (1) It is a belligerent right, and can be exercised only in time of war, unless in the case of a vessel reasonably suspected of piracy or breach of revenue regulations. (2) It can be exercised only by a ship of war duly commissioned by the sovereign of the belligerent power and only in the case of a merchant vessel, whether of an enemy or neutral power. (3) It cannot be exercised in neutral waters, and an attempt to exercise it in such waters is a gross violation of neutrality. (4) It can be exercised only for certain purposes, such as to examine the ship's papers and to see whether she carries any contraband goods. (5) After the ship of war has raised her flag an affirming gun (*coup d'assurance*) loaded with blank cartridge must be fired to bring the merchant vessel to. (6) In case of reasonable suspicion it is the duty of the ship of war to detain the

merchant vessel for the decision of a prize court. Resistance by a neutral vessel, whether alone or in convoy, renders her liable to capture according to the English and United States doctrine. But most Continental authorities lay down that the declaration of the officer in charge of the convoy is to be accepted, and that a refusal to accept such declaration may justify the convoy in resisting search. There is also a conflict of opinion as to whether a neutral loses his neutral rights by loading his goods on board an armed ship of the enemy. It has been held in England that such a proceeding is a violation of neutrality, as affording a presumption of resistance to search.

The right of search is historically interesting, as on two occasions it has brought Great Britain into collision with the United States. One of the causes of the war of 1812 was the right then claimed (but since abandoned) by Great Britain of searching vessels of the United States for British subjects serving in them as seamen, with a view to impressing them for the royal navy. In 1861 the British mail steamer "Trent" was stopped on the high seas by a United States ship of war, and Messrs Slidell and Mason, two commissioners of the Confederate States proceeding to Europe, were taken out of her and afterwards imprisoned in the United States. On diplomatic representations being made at Washington by the ambassadors of Great Britain and other powers the commissioners were released, and a war was avoided.

See in addition to the ordinary authorities on international law, *Visitation and Search*, by W. B. Lawrence, Boston, U.S., 1858.

SEA-SERPENT. The belief in enormous serpents, both terrestrial and marine, dates from very early times. Pliny (*H.N.*, viii. 14), following Livy (*Ept.*, xviii.), tells us of a land-serpent 120 feet long, which Regulus and his army besieged with balistæ, as though it had been a city, and this story is repeated by several other writers (Florus, ii. 2; Val. Max., i. 8; Gellius, vi. 3). The most prolific in accounts of the sea-serpent, however, are the early Norse writers, to whom the "Sö-Orm" was a subject both for prose and verse. Olaus Magnus (*Hist. Gent. Sept.*, xxi. 24) describes it as 200 feet long and 20 feet round, and states that it not only ate calves, sheep, and swine, but also "disturbs ships, rising up like a mast, and sometimes snaps some of the men from the deck," illustrating his account with a vivid representation of the animal in the very act. Pontoppidan, in his *Natural History* (Eng. tr., 1755, p. 195 sq.), says that its existence was generally believed in by the sailors and fishermen of his time, and recounts the means they adopted to escape it, as well as many details regarding the habits of the creature. The more circumstantial records of comparatively modern times may be most conveniently grouped according to the causes which presumably gave rise to the phenomena described. (1) A number of porpoises swimming one behind another may, by their characteristic mode of half emerging from and then re-entering the water during respiration, produce the appearance of a single animal showing a succession of snake-like undulations. The figure given by Pontoppidan was very likely suggested by such an appearance, and a sketch of an animal seen off Llandudno by several observers² looks as though it might have had a similar origin, notwithstanding that this hypothesis was rejected by them. (2) A flight of sea-fowl on one occasion recorded by Professor Aldis³ produced the appearance of a snake swimming at the surface of the water. (3) A large mass of seaweed has on more than one occasion been cautiously approached and even harpooned under the impression that it was such a monster.⁴ (4) A pair of basking sharks (*Selache maxima*) furnish an explanation of some of the recorded observations, as was first pointed out by Frank Buckland. These fish have a habit of swimming

in pairs, one following the other with the dorsal fin and the upper lobe of the tail just appearing above the water, and, as each animal is fully 30 feet long, the effect of a body of 60 or more feet long moving through the water is readily produced. To this category belongs the famous serpent cast up on Stronsay, one of the Orkneys, of which an account was read to the Wernerian Society of Edinburgh¹; some of its vertebrae were preserved in the Royal College of Surgeons of London, and identified as those of *Selache maxima* by both Home and Owen.² There is also evidence to show that specimens of *Carcharodon* must have existed more than 100 feet long.³ (5) Ribbon-fish (*Regalecus*), from their snake-like form and great length (sometimes as much as 20 feet), have been suggested as the origin of so-called "sea-serpents," amongst others by Dr Andrew Wilson⁴; but Dr Günther,⁵ from what is known regarding the habits of these fish, does not regard the theory as tenable. (6) A gigantic squid (*Architeuthus*) was most likely the foundation of the old Norse accounts,⁶ and also of those which in the early part of the 19th century came so frequently from the United States as to gain for the animal the sobriquet of "American sea-serpent."⁷ These stories were so circumstantial and on the whole so consistent, and vouched for by persons of such eminence, that no doubt was possible (notwithstanding the cavilling of Mitchell)⁸ as to the existence of a strange marine monster of very definite character in those regions. The description commonly given of it has been summed up by Gosse⁹ somewhat thus:—(i.) general form that of a serpent; (ii.) length averaging 60 feet; (iii.) head flattened, eye generally not mentioned, some distinctly stating that it was not seen; (iv.) neck 12 to 16 inches in diameter; (v.) appendages on the head, neck, or back (accounts here variable); (vi.) colour dark, lighter below; (vii.) swims at the surface, head thrown forward and slightly elevated; (viii.) progression steady and uniform, body straight but capable of being bent; (ix.) water spouting from it; (x.) in shape like a "nun buoy." The annexed figure (fig. 1) represents one which was seen from H. M. S. "Dædalus."¹⁰ To show the reasonableness of this hypothesis, it may be added

FIG. 1.—Sea-serpent, as seen from H. M. S. "Dædalus."

that gigantic Cephalopods are not unfrequent on the shores of Newfoundland,¹¹ and are occasionally met with on the coasts of Scandinavia,¹² Denmark, and the British Isles,¹³ that their extreme size seems to be above 60 feet, and, furthermore, that their mode of progression is by means of a jet of water forcibly expelled from the siphon, which would impart that equable motion to which several

observers allude as being evidently not produced by any serpentine bending of the body. A very interesting account of a monster almost certainly originating in one of these squids is that of Hans Egede,¹⁴ the well-known missionary to Greenland; the drawing by Bing, given in his work, is reproduced here (fig. 2), along with a sketch of a squid in the act of rearing itself out from the water (fig. 3), an action which they have been observed in aquaria habitually to perform. Numerous other accounts seem to be explicable by this hypothesis.¹⁵ (7) A sea-lion, or "Anson's seal" (*Morunga elephantina*), was suggested by Owen¹⁶ as a possible explanation of the serpent seen from H. M. S. "Dædalus"; but as this was afterwards rejected by Captain M'Quahae,¹⁷ who stated that it could not have been any animal of the seal kind, it seems better to refer the appearance to a squid as above stated. (8) A plesiosaurus, or some other of the huge marine reptiles usually believed to be extinct, might certainly

FIG. 2.—Sea-serpent, as observed by Hans Egede.

FIG. 3.—Squid, rearing itself out of the water.

have produced the phenomena described, granting the possibility of one having survived to the present time. Newman¹⁸ and Gosse¹⁹ have both supported this theory, the former citing as evidence in its favour the report of a creature with the body of an alligator, a long neck, and four paddles having been seen by Captain Hope of H. M. S. "Fly" in the Gulf of California.²⁰ (9) No satisfactory explanation has yet been given of certain descriptions of the sea-serpent; among others of this class may be mentioned the huge snake seen by certain of the crew²¹ of the "Pauline" in the South Atlantic Ocean, which was coiled twice round a large sperm whale, and then towered up many feet into the air, and finally dragged the whale to the bottom. Perhaps the most remarkable, however, is Lieutenant Hayne's²² account of a creature seen from H. M. yacht "Osborne." Two different aspects were recorded,—the first being a ridge, 30 feet in length, of tri-

angular fins, each rising 5 to 6 feet above the water, while the second view showed a large round head 6 feet in diameter, with huge flappers, which moved like those of a turtle.¹ It would thus appear that, while, with very few exceptions, all the so-called "sea-serpents" can be explained by reference to some well-known animal or other natural object, there is still a residuum sufficient to prevent modern zoologists from denying the possibility that some such creature may after all exist.

Quite distinct in origin from the stories already touched on is the legend of the sea-serpent or *tinnin* among the Arabs (Mas'udi, i. 266 sq.; Kazwini, i. 132 sq.; Damiri, i. 186 sq.), which is described in such a way as to leave no doubt that the waterspout is the phenomenon on which the fable rests. The *tinnin* is the Hebrew *tannin* (E.V. "whale," "dragon"), which in Ps. cxlviii. 7 might in the context be appropriately rendered "waterspout."

Roy. Phys. Soc. Edin.*, vol. ix. (W. E. HO.)

SEA-SICKNESS, a peculiar set of symptoms experienced by many persons when subjected to the pitching and rolling motion of a vessel at sea, of which depression, giddiness, nausea, and vomiting are the most prominent.

Although the vast majority of persons appear to be liable to this ailment on exposure to its exciting cause (the instances of complete and constant immunity being rare), they do not all suffer alike. Many endure distress of a most acute and even alarming kind, while others are simply conscious of transient feelings of nausea and discomfort. In long voyages, while many are affected with sea-sickness for the first few days only, others are tormented with it during the entire period, especially on the occurrence of rough weather. In short voyages, such as across the English Channel, not a few even of those susceptible escape, while others suffer in an extreme degree, the sickness persisting long after arrival on shore.

The symptoms generally show themselves soon after the vessel has begun to roll by the onset of giddiness and discomfort in the head, together with a sense of nausea and sinking at the stomach, which soon develops into intense sickness and vomiting. At first the contents of the stomach only are ejected; but thereafter bilious matter, and occasionally even blood, are brought up by the violence of the retching. The vomiting is liable to exacerbations according to the amount of oscillation of the ship; but seasons of rest, sometimes admitting of sleep, occasionally intervene. Along with the sickness there is great physical prostration, as shown in the pallor of the skin, cold sweats, and feeble pulse, accompanied with mental depression and wretchedness. In almost all instances the attack has a favourable termination, and it is extremely rare that serious results arise, except in the case of persons weakened by other diseases, although occasionally the symptoms are for a time sufficiently alarming.

The causes giving rise to sea-sickness have long been discussed, and a vast number of theories have been proposed. The conditions concerned in the production of the malady are apparently of complex character, embracing more than one set of causes. In the first place, the rolling or heaving of the vessel disturbs that feeling of the relation of the body to surrounding objects upon which our sense of security rests. The nervous system being thus subjected to a succession of shocks or surprises fails to effect the necessary adjustments for equilibrium. Giddiness and with it nausea and vomiting follow, aided probably by the profound vaso-motor disturbance which produces such

manifest depression of the circulation. Much has been made by some of the effects of the displacement of the abdominal viscera, especially the stomach, by the rolling of the vessel; but, while this may possibly operate to some extent, it can only be as an accessory cause. The same may be said of the influence of the changing impressions made upon the vision, which has been regarded by some as so powerful in the matter, since attacks of sea-sickness occur also in the dark, and in the case of blind persons. Other contributory causes may be mentioned, such as the feeling that sickness is certain to come, which may bring on the attack in some persons even before the vessel has begun to move; the sense of the body being in a liquid or yielding medium as it descends with the vessel into the trough of the sea, the varied odours to be met with on board ship, and circumstances of a like nature tend also to precipitate or aggravate an attack. Dr Chapman's view is that the essential cause is an undue afflux of blood to the spinal cord. But, in the few rare instances where sea-sickness has proved fatal, *post-mortem* appearances have been almost entirely negative, and only such as are met with in death from syncope.

Innumerable preventives and remedies have been proposed; but most of them fall far short of the success claimed for them. No means has yet been discovered which can altogether prevent the occurrence of sea-sickness, nor is it likely any will be found, since it is largely due to the pitching movements of the vessel, which cannot be averted. Swinging couches or chambers have not proved of any practical utility. No doubt there is less risk of sickness in a large and well-ballasted vessel than in a small one; but, even though the rolling may be considerably modified, the ascending and descending movements which so readily produce nausea continue. None of the medicinal agents proposed possess infallible properties: a remedy which suits one person will often wholly fail with another. There appears to be a wide concurrence of opinion that nerve sedatives are among the most potent drugs which can be employed; and full medicinal doses of bromide of potassium, chloral, or opium (the last two only under strict medical direction) taken before sailing appear to act usefully in the case of many persons. On the other hand, some high authorities have recommended the employment of nerve stimulants, such as a small cupful of very strong coffee to be taken about two hours before sailing, which will frequently prevent or mitigate the sickness. When the vessel is in motion, or even before starting, the recumbent position with the head low and the eyes closed should be assumed by those at all likely to suffer, and, should the weather admit, on deck rather than below,—the body, especially the extremities, being well covered. Many persons, however, find comfort and relief from lying down in their berths with a hot bottle to the feet, by which means sleep may be obtained, and with it a temporary abatement of the distressing giddiness and nausea. Should sickness supervene small quantities of some light food, such as thin arrowroot, gruel, or soup, ought to be swallowed if possible, in order to lessen the sense of exhaustion, which is often extreme. The vomiting may be mitigated by saline effervescent drinks, ice, chloroform, hydrocyanic acid, or opium. Alcohol, although occasionally useful in great prostration, is not generally found to be of much service, but tends rather to aggravate the sickness. Dr Chapman, in accordance with his view of the cause of the sickness, introduced a spinal ice-bag, which has been extensively employed and recommended; but, like every other plan of treatment, it has only occasional success. The more recently proposed remedies, such as nitrite of amyl and eucaïne, do not seem to yield any better results than the agents already mentioned.

SEATTLE, county seat of King county, Washington Territory, United States, on Seattle Bay, east side of Puget Sound, with Lake Union, 3 miles long, on the north, and Lake Washington, 25 miles long, on the east, is the largest city of the Territory. A ship canal to connect these lakes with Puget Sound is now (1886) in course of construction. Seattle has shipyards, foundries, machine-shops, sawmills, lumber-yards, breweries, and manufactories of furniture, carriages, cigars, crackers, patent medicines, boxes, and barrels. It possesses the Territorial university. The Columbia and Puget Sound and the Puget Sound Shore Railroads have their terminus here, whence large shipments of coal take place. The population in 1880 was 3533, and in 1885 it was estimated at 12,000.

¹ Dr Andrew Wilson has claimed this monster as a ribbon-fish, *Times*, 15th June 1877.

SEA WATER.¹ The ocean covers very nearly eight-elevenths of the total area of the globe; its average depth may be estimated as 2000 fathoms, and its total mass at 1.322×10^{18} (i.e., 1.3 million million millions) tons. Its general configuration must be assumed to have been substantially the same as it is now for thousands of years; hence we may safely conclude that the absolute composition of the ocean as a whole is constant in the sense of being only subject to very slow progressive millennial variation, and that, taking one part of the ocean with another, the percentage composition of the fixed part of the *solutum* can oscillate only within narrow limits. The composition of this *solutum* is very complex. According to Forchhammer, ocean salt in addition to the chlorides and sulphates of sodium, magnesium, potassium, and calcium—which had long been known to be its principal components—includes silica, boric acid, bromine, iodine, fluorine as acid, and the oxides of nickel, cobalt, manganese, aluminium, zinc, silver, lead, copper, barium, and strontium as basic components. Arsenic, gold, lithium, rubidium, cesium have been discovered since Forchhammer wrote. But all these subsidiary components, as that investigator found, amount to very little,—so little that in his numerous quantitative analyses of waters which he had procured from all quarters of the globe he confined himself to the determination of the chlorine, sulphuric acid, magnesia, lime, potash, and soda. The soda, however, he determined only by difference, assuming that the muriatic and sulphuric acids are united with the bases into perfectly neutral salts. As a general result he found that, in the open ocean, the ratio to one another of the several acids and bases named is subject to only slight variations. But his samples had all been collected at the surface; the potash had been determined by an insufficiently exact method; and the assumed neutrality of the total salt had not been proved. With the view primarily of supplementing Forchhammer's work, Dittmar made complete analyses of 77 of the samples brought home by the "Challenger," so selected that 34 out of the 77 represented depths of 1000 fathoms or more. His analyses brought out a small surplus of base, proving the presence of carbonate in all the waters; but the numerical values thus found for the "alkalinity," being charged with the observational errors of the whole series of determinations, could not be relied on. Dittmar therefore subsequently availed himself of a very easy and yet exact method for the direct determination of this quantity, which meanwhile had been discovered by Tornøe, and applied it to over 130 "Challenger" samples. He besides made a special inquiry into the relation between the quantity of lime and the depth at which the water had been collected, and a similar inquiry in regard to the bromine. As a general summary he gives the following three tables. The total salts contained in ocean water amount on an average to about 3.5 per cent., thus leaving 96.5 per cent. for the water proper.

TABLE I.—Average Composition of Ocean-Water Salts.

	Per 100 parts of Total Salts.	Per 100 of Halogen calculated as Chlorine.	
	Dittmar.	Dittmar.	Forchhammer.
Chlorine.....	55.292	99.848	Not determined.
Bromine.....	0.188	0.340	Not determined.
Sulphuric acid, SO ₃	6.410	11.576	11.88
Carbonic acid ³ , CO ₂	0.152	0.274	Not determined.
Lime, CaO.....	1.676	3.026	2.93
Magnesia, MgO.....	6.209	11.212	11.03
Potash, K ₂ O.....	1.332	2.405	1.93
Soda, Na ₂ O.....	41.234	74.462	Not determined.
(Basic oxygen, equivalent to the halogens).....	(-12.493)	(-22.559)
Total salts.....	100.000	180.584	181.1

TABLE II.—Results from combining Acids and Bases (Dittmar).

Chloride of sodium.....	77.758	Sulphate of potash.....	2.465
Chloride of magnesium.....	10.878	Bromide of magnesium.....	0.217
Sulphate of magnesium.....	4.737	Carbonate of lime.....	0.345
Sulphate of lime.....	3.600	Total salts.....	100.000

Reducing to the absolute mass of the ocean as given above, we arrive at the following numbers:—

TABLE III.—Absolute Composition of the Salts of the Ocean.

Unit = 1 million million = 10^{12} tons.

Chloride of sodium.....	35990	Sulphate of potash.....	1141
Chloride of magnesium.....	5034	Bromide of magnesium.....	100
Sulphate of magnesium.....	2192	Carbonate of lime.....	160
Sulphate of lime.....	1666		46283
Total bromine.....	87.2	(Dittmar).	
Total iodine.....	0.03	(Köttstorfer).	
Total chloride of rubidium.....	25.0	(C. Schmidt).	

Of the several quantities recorded in columns 2 or 3 of Table I. "carbonic acid" is proved to be subject to variation; all the rest, including even the bromine, are practically constant. This shows that Forchhammer's proposition holds for ocean water from all depths, with one important qualification: special research on the lime showed that its quantity increases slightly but appreciably with the depth. Taking s , m , d as representing the lime per 100 of chlorine in shallow, medium-depth, and deep-sea water respectively, Dittmar found as mean results of analyses which agreed very well together—

$$s = 3.0175 \quad m = 3.0300 \quad d = 3.0308$$

$$\text{Probable error, } \pm 0.0012 \quad \pm 0.0014 \quad \pm 0.0011.$$

But $m - s = 0.0124$ and $d - s = 0.0132$. One explanation of this result is that the crustaceans, foraminifera, and molluscs which form carbonate of lime shells live chiefly in surface waters, but after their death sink to the bottom, where—especially in great depths—their carbonate of lime is partially redissolved.

Oceanic Carbonic Acid.—It is well known that not only in the neighbourhood of actual volcanoes but in thousands of other places on the dry land carbonic acid gas is constantly streaming forth into the atmosphere, and it is generally admitted now that this supply of telluric carbonic acid amounts to more than all that is furnished by processes of combustion and respiration. That carbonic acid springs should be absent from the bottom of the ocean is too absurd an assumption to be entertained; hence, supposing even the water of the ocean were perfectly neutral, it could not but contain dissolved carbonic acid. But such carbonic acid, at the ocean surface at least, would constantly tend to assume, and in general probably actually would come down to, the small limit value prescribed to it by the given proportion by volume of the carbonic acid in the atmosphere and the laws of gas-absorption. This proportion, according to the best modern researches, is almost constant, everywhere amounting to very nearly 0.0003 volume per unit volume of air. The coefficient of absorption by even pure water is 1.8 at 0° and 1.0 at 15° C. Hence, even in the polar regions, the surface water could not hold in permanent solution more than about 0.54 c.c., or say one milligramme per litre of water. Jacobsen, in his

² Equal conjointly to 55.376 parts of chlorine, which accordingly is the percentage of "halogen reckoned as chlorine" in the real total solids.

³ Calculating the surplus base as normal carbonate. In Table II. this carbonate is represented as so much CaCO₃.

¹ All our knowledge of the subject of chemical oceanography—a branch of physical geography which has only lately come to be extensively cultivated—is derived from a series of investigations chiefly embodied in the following publications:—(1) Forchhammer, "On the Composition of Sea Water," &c., in *Phil. Trans.*, i. 155, pp. 203-262 (1865); (2) Oscar Jacobsen, *Ann. d. Chem.*, vol. clxvii. p. 1 sq. (1873); (3) *Den Norske Nordhavs Expedition, 1876-78: Chemi*, by Tornøe; (4) the *Jahresberichte* of the Kiel committee for the scientific investigation of the German Ocean, 1873-82; (5) *Physics and Chemistry of the Voyage of H.M.S. "Challenger"*—I. "Report on Researches into the Composition of Ocean Water," &c., by Prof. W. Dittmar, January 1884; II. "Report on the Specific Gravity of samples of Ocean Water," &c., by J. Y. Buchanan, January 1884; III. "Report on Deep-sea Temperature," &c., by the officers of the expedition. A shorter and more popular exposition of the whole is found in—(6) *Narrative of the Cruise of H.M.S. "Challenger"* (1885). The excellent *Handbuch der Oceanographie* (Stuttgart), by Prof. G. von Boguslawski, may be referred to as being almost up to date.

numerous analyses of North Sea water, found from 90 to 100 milligrammes per litre; but he also observed that only a small portion of the carbonic acid is eliminated on boiling: the rest comes out only when the water is distilled to dryness. He presumed that the gas was retained chemically by the chloride of magnesium. Buchanan, who inquired into the subject synthetically, arrived at the conclusion that it was the sulphates¹ in sea water (*qua* sulphates) which retained the carbonic acid. Accordingly in his numerous carbonic acid determinations he liberated the gas by distilling the water down with an excess of chloride of barium. Tornøe was the first to prove that the carbonic acid in sea water is present as carbonate, and that, in the northern part of the North Atlantic at least, the total carbonic acid, while considerably greater than the quantity which would convert the surplus base into normal, falls short of that which would be required to produce fully saturated acid carbonate.

Even without Tornøe's discovery it would have been necessary to find the true interpretation of the results of the numerous carbonic acid determinations made during the voyage of the "Challenger" by Buchanan. Dittmar had no difficulty in proving the non-existence of the alleged affinity of sulphates for carbonic acid, and naturally concluded that the chloride of barium used in the processes liberates the loose part of the carbonic acid by converting the normal carbonate part into a precipitate of carbonate of baryta, thus— $R'CO_3 + xCO_2 + BaCl_2 = R'Cl_2 + BaCO_3 + xCO_2$. A series of synthetical experiments showed that this is substantially, though not exactly, correct. If Buchanan's *modus operandi* be rigorously followed, the carbonic acid obtained, as a rule, falls somewhat short of the actual amount of loose carbonic acid present, while on resuming the distillation after addition of fresh water an appreciable part of fixed carbonic acid passes away as gas. Yet, Buchanan's results being of great value, Dittmar discussed them (conjointly with his own alkalinity determinations) on the basis of the assumption that they afforded a fair approximation to the proportions of loose carbonic acid in the respective waters. His general conclusions are as follows. Taking "alkalinity" as meaning the "weight" of the carbonic acid, CO_2 , in the normal carbonate part of the carbonate present per 100 parts of total solids, the alkalinity in the water samples analysed (omitting a few obviously abnormal cases) was found to be as follows (Table IV.):—

Alkalinity ranges from	Number of Cases.	Alkalinity ranges from	Number of Cases.
0.1400 to 0.1439	9	0.1640 to 0.1719	6
0.1440 " 0.1479	34	Alk. = 0.1731	1
0.1480 " 0.1519	40	" = 0.1888	1
0.1520 " 0.1559	19	" = 0.2079	1
0.1560 " 0.1599	12	0.1400 to 0.2079	127
0.1600 " 0.1639	4		

Values above 0.16 are obviously exceptional; hence the normal range may be said to be from 0.14 to 0.16. The most frequently occurring values were found to be about 0.146 in the case of surface or shallow sea water, and in the case of bottom water about 0.152. In regard to the loose carbonic acid a full discussion of Buchanan's results led to the following conclusions:—(1) carbonic acid rarely occurs in the free state; as a rule it falls short of the quantity which would produce bicarbonate; (2) in surface waters it is relatively high where the natural temperature is relatively low, and *vice versa*; (3) within equal ranges of temperature it seems to be less in the surface water of the Pacific than it is in that of the Atlantic Ocean. Of the 195 samples of sea water which Buchanan analysed for carbonic acid only 22 contained fully saturated bicarbonate, and only 2 out of these are proved by the analyses to have contained free carbonic acid in addition to bicarbonate. In all the remaining 173 samples the "carbonic acid deficit" (meaning the proportion of carbonic acid which was wanted to completely transform the carbonate into bicarbonate) assumed tangible and often considerable values. We are probably safe in concluding that the ocean as a whole will have to continue taking in carbonic acid for thousands of years before its carbonic acid deficit has been reduced to nothing. But it is as well to observe that at its surface in the warmer latitudes the attainment of this condition is a physical impossibility as long as the percentage of carbonic acid in the air retains its present low value.

A solution of a bicarbonate when shaken, say in a bottle, with pure air (free of carbonic acid) at summer heat gives up its combined carbonic acid to the air space in the bottle until the partial tension of the acid gas there has come up to a limit value p , which is called the dissociation tension of the bicarbonate at the prevailing temperature t . General experience concerning such phenomena warrants the presumption that, up to a certain (low) temperature t_0 , $p=0$, and thence onwards, p increases with t . It does not follow that the bicarbonate in a solution when shaken again and again with even pure air tends to become normal carbonate; for aught we know, the elimination of carbonic acid may stop as soon as the residual carbonate has come down to some composition

$R'O(1+x)CO_2$ (where x is less than 1), and x may be a function of temperature. Dittmar has attempted to determine the course of the function $1+x=f(t)$ in reference to natural sea water on the one hand and to pure air (air freed of its carbonic acid) and ordinary air on the other. One sample of sea water containing its surplus base as practically bicarbonate served for all the experiments. It was shaken again and again at a fixed temperature t with one or the other kind of air, until (after "N" shakings, always with renewed air) the stage of saturation appeared to have become constant. The investigation is not completed yet; the following table (V.) gives the results which have come out so far. The final carbonate was $R_2O.nCO_2$.

t .	N.	Pure air. n_0 .	Ordinary air. n_1 .	t .	N.	Pure air. n_0 .	Ordinary air. n_1 .
2° C.	200	1.90	..	15°	200	1.50	..
2°	200	2.04	..	20°	200	1.42 (?)	..
2°	52	..	2.06	25°	52	1.38	..
10°	200	1.70	..	32°	52	1.33	..
13°	50	..	1.841	32°	52	..	1.89
15°	100	1.68	..	32°	150	..	1.82

Hence we see that even at the highest temperature, and with air free from carbonic acid, the carbonate never came down below the state of sesquicarbonate, while with ordinary air, even at 32° C., it never fell below $n=1.8$. At 2° n_0 as well as n_1 was =2, the value characteristic of bicarbonate. Now Buchanan reports a good number of cases where, even at lower temperatures, n was considerably less than 1.8 at any rate. Hence, if his numbers are correct, unless the atmosphere acts more powerfully than the air in Dittmar's bottle, it would appear that deep-sea water is in general below even the stage of carbonic acid saturation which it could attain at the surface at high temperatures.

In any mixed solution of salts every base is combined with every acid; hence the "carbonate" of sea water is strictly speaking a complex plural. But as a matter of probability the carbonic acid has very little chance of uniting with any of the potash or soda, and the overwhelmingly large quantity of alkaline chloride would no doubt convert any carbonate of magnesia that was introduced into double chloride of magnesium and alkali metal; hence it is fair to assume that oceanic carbonate is chiefly carbonate of lime. Now immense quantities of this compound are being constantly introduced into the ocean by rivers. Dumas once gave it as his opinion that this imported carbonate remains dissolved in the ocean as long as and wherever the carbonate there is at the bicarbonate stage; but, as soon as part of the loose carbonic acid goes off into the air, the corresponding weight of normal carbonate separates out as an addition, ultimately, to the solids on the bottom. Dittmar has tried to test this notion synthetically, but without arriving at very definite results. According to his experiments sea water which contains free carbonic acid dissolves added solid carbonate of lime, and more largely carbonate of magnesia; sea water which contains fully, or almost fully, saturated bicarbonate dissolves carbonate of magnesia very appreciably, but would not appear to act on carbonate of lime at all. But, when carbonate of lime was produced in the water by successive additions of potential calcium carbonate in the form of dissolved sodium carbonate and its equivalent of calcium chloride, the original carbonate of lime could be increased very largely, with formation of solutions which remained clear during a long-continued period of observation. As a set-off against this a few of the many hundred samples of sea water which he received from the "Challenger" deposited in the course of a number of years crystalline crusts of carbonate of lime on the sides of the bottles; and the mother-liquor never contained more than the normal quantity of lime per 100 parts of chlorine. In discussing this question Dittmar gives an estimate, based on data furnished by Boguslawski's work, of the total carbonate of lime introduced into the ocean annually by the thirteen principal rivers; and by doubling the quantity he estimates the carbonate of lime introduced by all rivers as equal to about 1.34×10^9 tons. Now the sum total of carbonate of lime, $CaCO_3$, in the ocean amounts to about 160×10^{12} tons; hence it would take 1190 years to increase the present stock of carbonate of lime in the ocean by one per cent. of its value.

Absorbed Oxygen and Nitrogen in Ocean Water.—As a matter of physical necessity these two gases must be present in the water of the ocean—and they may be presumed in general to pervade it to its greatest depth—because the whole of the surface of the sea is in constant contact with the atmosphere. Our knowledge regarding their distribution in the ocean may be said to date from 1872, when Jacobsen inquired into the matter in a most masterly manner in connexion with the German North Sea expedition. The work of his predecessors possesses no scientific value, because they employed inadequate methods. Unlike them, Jacobsen did not attempt to analyse a sample of sea water air on board ship: he extracted the air from measured samples (by an excellent method of his own) and then sealed them up in glass tubes, to measure and analyse them after his return home. Buchanan, during the

¹ See GEOLOGY, vol. x. p. 222.

"Challenger" cruise adopted Jacobsen's method. Of the 164 samples which he sealed up successfully 69 came from the surface and 95 from depths varying from 5 to 4575 fathoms. A good number of these he analysed himself after his return; the majority, however, were analysed and all were measured by Dittmar. The latter, in order to be able to interpret the results, also investigated the absorption of oxygen and nitrogen gas from air by sea water. The following table (VI.) gives the result of his investigations. One litre (1000 volumes) of ocean water when saturated with constantly renewed air at t° , and a pressure of 760 millimètres¹ plus tension of steam at t° C., takes up the following volumes, measured dry at 0° C. and 760 millimètres pressure,¹ of the pure gases.

Temperature.	Dissolved Nitrogen and Oxygen in Cubic Centimetres (volumes).		Percentage of Oxygen in Dissolved Gas.
C.	Nitrogen.	Oxygen.	
0°	15.60	8.18	34.40
5°	13.86	7.22	34.24
10°	12.47	6.45	34.09
15°	11.34	5.83	33.93
20°	10.41	5.31	33.78
25°	9.62	4.87	33.62
30°	8.94	4.50	33.47
35°	8.36	4.17	33.31

The method used for obtaining these numbers adapted itself closely to the one which Buchanan had employed for extracting the gas samples. In the calculations it was assumed that atmospheric air contains 21.0 volumes of oxygen for 79.0 volumes of nitrogen, the slight variation in this ratio, which is known to occasionally present itself, being neglected. From the table we can calculate approximately the limits between which the proportions of dissolved oxygen and nitrogen in the water of the ocean must be presumed to oscillate in nature. The pressure of the atmosphere at the sea-level, though by no means constant, is never far removed from that of 760 mm. of mercury. The temperature of the surface water (with rare exceptions) may be said to vary from -2° C. (in the liquid part of the ocean in the arctic and antarctic regions) to about 30° C. (in the tropics). The ocean receives all its dissolved oxygen and nitrogen from the surface; neither gas comes in from below, except perhaps a relatively insignificant quantity of nitrogen derived from the decay of dead organisms, which may safely be neglected. Hence the ocean can contain nowhere more than 15.6 c.c. of nitrogen or more than 8.18 c.c. of oxygen per litre, and the nitrogen will never fall below 8.55 c.c. We cannot make a similar assertion in regard to the oxygen, because its theoretical minimum of 4.30 c.c. per litre is liable to further diminution by processes of life and putrefaction and by oxidation generally.²

At any point in the surface of the ocean the water constantly tends to assume the composition demanded for the prevailing temperature by the laws of gas absorption. But it is rarely possible for it to assume this composition, owing to the water being in a continual state of motion; and, supposing a certain area of the ocean surface were in a state of stagnation, the temperature would vary in diurnal cycles, and even the calculated volume of nitrogen per litre would be a periodic function of time, exhibiting its maximum at the hour of minimum temperature, and *vice versa*. The process of absorptiometric exchange, however, even at the constantly oscillating surface of the ocean, is slow; it could not keep pace with the change of temperature, and the actual nitrogen curve would never go as high up or as low down as the theoretical one. In addition to this, the lower strata of the water constantly add to, or take away from, the surface nitrogen by diffusion and occasional intermixture. All this holds for the oxygen likewise, except that it is liable to constant diminution by oxidation. On the whole we may assume that all the disturbing influences will only modify, not efface, the course of events as prescribed by the laws of gas-absorption.

In regard to non-surface water we have to confront a greater complexity of phenomena. The gas-contents of deep-sea water, of course, have nothing to do with the low temperature and the high pressure which in general prevail there. For the purpose of a preliminary survey, let us imagine a deep-sea water formed from one kind of surface water, which took up its air at a constant temperature (t), and then sank down unmixed with other waters. The volumes of the oxygen and nitrogen per litre have at first the values assigned to them by the laws of gas absorption. But, while the nitrogen (as long as the water remains unmixed with other water) remains constant, the oxygen will become less and less through the processes of oxidation which go on in the deep without compensation. Hence if there were absolute stagnation in the ocean anywhere the proportion of oxygen there might be reduced ultimately to nothing. Among the many "Challenger" deep-sea specimens which were analysed for their gas-contents none was

found quite free from absorbed oxygen; and this confirms the conclusion that absolute stagnation exists nowhere in the ocean, not even at its greatest depth. Occasionally, however, the oxygen was found to have sunk down to very little, as shown by the following two examples:—

No. of Sample.	G.c. per Litre of Nitrogen.	Oxygen.	G.c. of Oxygen calculated from Nitrogen.	Depth in Fathoms.
1001	15.08	0.6	8.21	2875
1646	18.38	2.04	6.95	1500

There must have been an approximation to absolute rest at these two places at any rate. On the whole, the results of the gas analysis, as interpreted on the basis of Dittmar's absorptiometric determinations, agreed fairly well with the inferences which we have just been deducing from physical laws. There was no lack of anomalous results, but it was not found possible to trace them to natural causes. The equilibrium in regard to the absorbed nitrogen and oxygen in the ocean is maintained by the atmosphere; and, from the fact that the air contained in surface water is always richer in oxygen than is atmospheric air, one naturally concludes that the ocean should constantly add to the percentage of oxygen in the air in the tropics and constantly diminish it in the colder latitudes. But Regnault's numerous air-analyses do not confirm this. Nor need this be wondered at, since, as we have seen, even the corresponding influence on the atmospheric carbonic acid has so far defied the powers of chemical analysis.

Salinity of Ocean Water.—Even in the open ocean the "salinity"—meaning in a given quantity the ratio between the weight of dissolved salt and the weight or volume of the whole—is subject to considerable variation; and it obviously is one of the foremost duties of observing oceanographers to collect the data by means of which it may be possible one day to represent that quantity mathematically as a function of geographic position, depth, and time. For the quantitative determination of the salinity an obvious, easy, and sufficient method is to determine the specific gravity S at a convenient temperature t ; this in fact is the method which has so far been employed by all observers almost to the exclusion of every other. Buchanan used it during the "Challenger" cruise perhaps more extensively than any of his predecessors had done. Of the arithmetical relation between salinity on the one hand and S and t on the other the successive researches of Ekman (as supplemented by Tornöe), Thorpe and Rücker, Dittmar, and others have given us a practically sufficient knowledge. According to Dittmar the function (within the limits of Buchanan's values) coincides practically with the formula

$$S_t - {}_4W_t = \chi(a + bt + ct^2),$$

where ${}_4S_t$ means the specific gravity at t° C. referred to that of pure water of $+4^\circ$ C. as equal to 1000; ${}_4W_t$ has a similar meaning in reference to pure water; χ stands for the weight of total halogen calculated as chlorine per 1000 parts, by weight, of sea water; and $a = 1.45993$, $b = -0.005592$, $c = +0.0000649$. For oceanographic purposes, however, it is not necessary to go back to χ ; it suffices from series of values ${}_4S_t$ to deduce the corresponding values ${}_4S_0$ for a convenient standard temperature, and to reason on these reduced numbers as if they measured the salinity, just as we take the readings of a thermometer as in themselves representing "temperatures." This, in fact, is always done; only unfortunately different standard temperatures have been chosen by different observers; Buchanan adopted $15^\circ 56$ C. = 60° Fahr. Before going further, let us observe that the specific gravity of sea water, taking it as it is *in situ*, has an important oceanographic significance, even as such. But this quantity in the case of deep-sea waters is influenced very largely³ by the pressure of the superincumbent layer of water—which in itself is a complex function of the successive temperatures and salinities—and unfortunately we still lack the constants and formulae for making the necessary reductions with adequate exactitude. Meanwhile all our statistics of sea water specific gravities, valuable as they are, constitute statistics of only salinities and nothing else.

At the surface of the ocean the salinity is liable chiefly to three influences,—(1) concentration by formation of ice or by the action of dry winds; (2) dilution through the melting of ice or the falling of rain; (3) concentration or dilution through the virtual addition of salt or water by inflowing currents of saltier or fresher water respectively. The effect of the formation or melting of ice, though great within the arctic circles, does not tell much on the non-polar seas. More important in regard to these is the effect of the south-east and the north-east trade winds, which in the Pacific blow between about 3° and 21° S. lat. and between about 2° and 20° N. lat. respectively, leaving between the two a belt of 5° of a region of calms (see more exactly, METEOROLOGY, vol. xvi. p. 144). In the Atlantic the limiting lines of both trades oscillate annually, so that the equatorial boundary of the north-east trade shifts from 3° to 11° N. lat., and that of the south-east trade from about 1° to 3° N. lat.

¹ Theoretically any number may be substituted for 760; for calculating purposes read "1 millimètre."

² In calculating these limit values the tension of the vapour of water is taken into account; hence the apparent non-agreement with the entries in the table.

³ According to Grassi's experiments, if sea water under the pressure of one atmosphere has the specific gravity 1026, it assumes at depths=1000, 2000, 3000 fathoms a density of $1026 + 1, 2, 3$ times 7.9 units = $1033.9, 1041.8, 1049.7$ respectively.

strated with him, but, finding him inflexible, ordered that he should be bound to a stake and shot to death. After the archers had left him for dead a devout woman, Irene, came by night to take his body away for burial, but, finding him still alive, carried him to her house, where his wounds were dressed. No sooner had he wholly recovered than he hastened to confront the emperor, reproaching him with his impiety; Diocletian, filled with astonishment, which soon changed into fury, ordered him to be instantly carried off and beaten to death with rods (288). The sentence was forthwith executed, his body being thrown into the cloaca, where, however, it was found by another pious matron, Lucina, whom Sebastian visited in a dream, directing her to bury him in the Catacombs under the site of the church now called by his name. He is celebrated by the Roman Church on 20th January (duplex). His cult is chiefly diffused along the eastern coast of Italy and in other districts liable to visitations of plague. As a young and beautiful soldier, he is a favourite subject of sacred art, being most generally represented as undraped and severely, though not mortally, wounded with arrows.

SEBASTIANO DEL PIOMBO (1485-1547), painter, was born at Venice in 1485, and belongs to the Venetian school, exceptionally modified by the Florentine or Roman. His family name was Luciani. He was at first a musician, chiefly a solo-player on the lute, and was in great request among the Venetian nobility. He soon showed a turn for painting, and became a pupil of Giovanni Bellini and afterwards of Giorgione. His first painting of note was done for the church of St John Chrysostom in Venice, and is so closely modelled on the style of Giorgione that in its author's time it often passed for the work of that master. It represents Chrysostom reading aloud at a desk, a grand Magdalene in front, and two other female and three male saints. Towards 1512 Sebastiano was invited to Rome by the wealthy Sienese merchant Agostino Chigi, who occupied a villa by the Tiber, since named the Farnesina; he executed some frescos here, other leading artists being employed at the same time. The Venetian mode of colour was then a startling novelty in Rome. Michelangelo saw and approved the work of Luciani, became his personal friend, and entered into a peculiar arrangement with him. At this period the pictorial ability of Michelangelo (apart from his general power as an artist, regarding which there arose no question) was somewhat decried in Rome, the rival faculty of Raphael being invidiously exalted in comparison; in especial it was contended that Buonarroti fell short as a colourist. He therefore thought that he might try whether, by furnishing designs for pictures and leaving to Sebastiano the execution of them in colour, he could not maintain at its highest level his own general supremacy in the art, leaving Raphael to sustain the competition as he best might. In this there seems to have been nothing particularly unfair, always assuming that the compact was not fraudulently concealed; and the facts are so openly stated by Michelangelo's friend Vasari (not to speak of other writers) that there appears to have been little or no disguise in the matter. Besides, the pictures are there to speak for themselves; and connoisseurs have always acknowledged that the quality of Michelangelo's unmatched design is patent on the face of them. Of late years, however, some writers, unnecessarily jealous for Buonarroti's personal rectitude, have denied that his handiwork is to be traced in the pictures bearing the name of Sebastiano. Four leading pictures which Sebastiano painted in pursuance of his league with Buonarroti are the *Pietà* (earliest of the four), in the church of the Conventuali, Viterbo; the *Transfiguration* and the *Flagellation*, in the church of S. Pietro in Montorio, Rome; and, most celebrated of

all, the *Raising of Lazarus*, now in the London National Gallery. This grand work—more remarkable for general strength of pictorial perception than for qualities of detailed intellectual or emotional expression—is more than 12 by 9 feet in dimensions, with the principal figures of the natural size; it is inscribed "*Sebastianus Venetus faciebat*," and was transferred from wood to canvas in 1771. It was painted in 1517-19 for Giulio de' Medici, then bishop of Narbonne, afterwards Pope Clement VII.; and it remained in Narbonne cathedral until purchased by the duke of Orleans early in the 18th century,—coming to England with the Orleans gallery in 1792. It is generally admitted that the design of Michelangelo appears in the figure of Lazarus and of those who are busied about him (the British Museum contains two sketches of the Lazarus regarded as Michelangelo's handiwork); but whether he actually touched the panel, as has often been said, appears more than doubtful, as he left Rome about the time when the picture was commenced. Raphael's *Transfiguration* was painted for the same patron and the same destination. The two works were exhibited together, and some admirers did not scruple to give the preference to Sebastiano's. The third of the four pictures above mentioned, the *Flagellation of Christ*, though ordinarily termed a fresco, is, according to Vasari, painted in oil upon the wall. This was a method first practised by Domenico Veneziano, and afterwards by some other artists; but Sebastiano alone succeeded in preventing the blackening of the colours. The contour of the figure of Christ in this picture is supposed by many to have been supplied by Buonarroti's own hand. Sebastiano, always a tardy worker, was occupied about six years upon this work, along with its companion the *Transfiguration*, and the allied figures of saints.

After the elevation of Giulio de' Medici to the pontificate, the office of the "*piombo*" or leaden seal—that is, the office of sealer of briefs of the apostolic chamber—became vacant; two painters competed for it, Sebastiano Luciani, hitherto a comparatively poor man, and Giovanni da Udine. Finally Sebastiano, assuming the habit of a friar, secured the very lucrative appointment,—with the proviso, however, that he should pay out of his emoluments 300 scudi per annum to Giovanni. If he had heretofore been slow in painting, he became now supine and indifferent in a marked degree. He lived on the fat of the land, cultivated sprightly literary and other society, to which he contributed his own full quota of amusement, and would scarcely handle a brush, saying jocularly that he benefited the profession by leaving all the more work for other artists to do. Berni, one of his intimates, addressed a *capitolo* to him, and Sebastiano responded in like versified form. One of the few subject-pictures which he executed after taking office was Christ carrying the Cross for the patriarch of Aquileia, also a Madonna with the body of Christ. The former painting is done on stone, a method invented by Sebastiano himself. He likewise painted at times on slate,—as in the instance of Christ on the Cross, now in the Berlin gallery, where the slate constitutes the background. In the same method, and also in the same gallery, is the Dead Christ supported by Joseph of Arimathea, with a weeping Magdalene,—colossal half-length figures. Late in life Sebastiano had a serious disagreement with Michelangelo with reference to the Florentine's great picture of the Last Judgment. Sebastiano encouraged the pope to insist that this picture should be executed in oil. Michelangelo, determined from the first upon nothing but fresco, tartly replied to his holiness that oil was only fit for women and for sluggards like Friar Sebastian; and the coolness between the two painters lasted almost up to the friar's death. This event, consequent upon a violent fever acting rapidly upon a

very sanguine temperament, took place at Rome in 1547. Sebastiano directed that his burial, in the church of S. Maria del Popolo, should be conducted without ceremony of priests, friars, or lights, and that the cost thus saved should go to the poor; in this he was obeyed.

Numerous pupils sought training from Sebastiano del Piombo; but, owing to his dilatory and self-indulgent habits, they learned little from him, with the exception of Tommaso Laureti. Sebastiano, conscious of his deficiency in the higher sphere of invention, made himself especially celebrated as a portrait painter: the likeness of Andrea Doria, in the Doria Palace, Rome, is one of the most renowned. In the London National Gallery are two fine specimens: one canvas represents the friar himself, along with Cardinal Ippolito de' Medici; the other, a portrait of a lady in the character of St Agatha, used to be identified with one of Sebastiano's prime works, the likeness of Julia Gonzaga (painted for her lover, the aforementioned cardinal), but this assumption is now discredited. There were also portraits of Marcantonio Colonna, Vittoria Colonna, Ferdinand marquis of Pescara, Popes Adrian VI., Clement VII. (Studj Gallery, Naples), and Paul III., Sanmicheli, Anton Francesco degli Albizzi, and Pietro Aretino. One likeness of the last-named sitter is in Arezzo and another in the Berlin gallery.

SEBASTOPOL, or SEVASTOPOL, the chief naval station of Russia on the Black Sea, is situated in the south-west of the Crimea, in 44° 37' N lat. and 33° 31' E. long., 935 miles from Moscow, with which it is connected by rail *via* Kharkoff. The estuary, which is one of the best roadsteads in Europe and could shelter the combined fleets of Europe, is a deep and thoroughly sheltered indentation among chalky cliffs, running east and west for nearly 3½ miles, with a width of three-quarters of a mile, narrowing to 930 yards at the entrance, where it is protected by two small promontories. It has a depth of from 6 to 10 fathoms, with a good bottom, and large ships can anchor at a cable's length from the shore. The main inlet has also four smaller indentations,—Quarantine Bay at its entrance, Yuzhnaya (Southern) Bay, which penetrates more than a mile to the south, with a depth of from 4 to 9 fathoms, Dockyard Bay, and Artillery Bay. A small river, the Tchernaya, enters the head of the inlet. The main part of the town, with an elevation ranging from 30 to 190 feet, stands on the southern shore of the chief inlet, between Yuzhnaya and Artillery Bays. To the east are situated the barracks, hospitals, and storehouses; a few buildings on the other shore of the chief bay constitute the "northern side." Before the Crimean War of 1853-56 Sebastopol was a well-built city, beautified by gardens, and had 43,000 inhabitants; but at the end of the siege it had not more than fourteen buildings which had not been badly injured. After the war many privileges were granted by the Government in order to attract population and trade to the town; but both increased slowly, and at the end of seven years its population numbered only 5750. The railway line connecting Sebastopol with Moscow gave some animation to trade, and it was thought at the time that Sebastopol, although precluded by the treaty of Paris from reacquiring its military importance, might yet become a commercial city. In November 1870, during the Franco-German War, the Russian Government publicly threw off the obligation of those clauses of the treaty of Paris which related to the Black Sea fleet and fortresses, and it was decided again to make Sebastopol a naval arsenal. In 1882 Sebastopol had a population of 26,150 inhabitants, largely military. The town has been rebuilt on a new plan, and a fine church occupies a prominent site. There are now two lyceums and a zoological marine station. Although belonging to the government of Taurida, Sebastopol and its environs are under a separate military governor.

The peninsula between the Bay of Sebastopol and the Black Sea became known in the 7th century as the Hæraclæotic Chersonese (see vol. vi. p. 587). In the 5th century B.C. a Greek colony was founded here and remained independent for three centuries, when it became part of the kingdom of the Bosphorus, and subsequently

tributary to Rome. Under the Byzantine emperors Chersonesus was an administrative centre to their possessions in Taurida. According to the Russian annals, Vladimir, prince of Kieff, conquered Chersonesus (Korsuñ) before being baptized there, and restored it to the Greeks on marrying the princess Anna. Subsequently the Slavonians were cut off from relations with Taurida by the Mongols, and only made occasional raids, such as that of the Lithuanian prince Olgerd. In the 16th century a new influx of colonizers, the Tatars, occupied Chersonesus and founded a settlement named Akhtiar. This village, after the Russian conquest in 1783, was selected for the chief naval station of the empire in the Black Sea and received its present name ("The August City"). In 1826 strong fortifications were begun, and in 1853 it was a formidable fortress. In September 1854, after having defeated the Russians in the battle of the Alma, the Anglo-French laid siege to the southern portion of the town, and on 17th October began a heavy bombardment. Sebastopol, which was nearly quite open from the land, was strengthened by earthworks thrown up under the fire of the besiegers, and sustained a memorable eleven months' siege. On 8th September 1855 it was evacuated by the Russians, who retired to the north side. The fortifications were blown up by the allies, and by the Paris treaty the Russians were bound not to restore them.

SEBENICO (*Sibenik*), a town of Austrian Dalmatia, on the coast of the Adriatic, about half-way between Zara and Spalato, is situated on an irregular basin at the mouth of the Kerka, connected with the sea by a winding channel 3 miles long. The channel is defended by a fort designed by Sanmicheli, and the town itself, picturesquely situated on the abrupt slope of a rocky hill, is guarded by three old castles, now dismantled. There is also a wall on the landward side. Sebenico is the seat of a bishop, and its Italian Gothic cathedral, dating from the 15th and 16th centuries, is considered the finest church in Dalmatia. Its excellent harbour and its situation at the entrance of the Kerka valley combine to make Sebenico the entrepôt of a considerable trade. Fishing is carried on extensively. The population of the commune in 1880 was 18,104, of the town proper about 8000.

SECCHI, ANGELO (1818-1878), Italian astronomer, was born on 29th June 1818 at Reggio in Lombardy, and entered the Society of Jesus at an early age. In 1849 he was appointed director of the observatory of the Collegio Romano, which was rebuilt in 1853; there he devoted himself with great perseverance to researches in physical astronomy and meteorology till his death at Rome on 26th February 1878.

The results of Secchi's observations are contained in a great number of papers and memoirs. From about 1864 he occupied himself almost exclusively with spectrum analysis, both of stars (*Catalogo delle Stelle di cui si è determinato lo Spettro Luminoso*, Paris, 1867, 8vo; "Sugli Spettri Prismatici delle Stelle Fisse," two parts, 1868, in the *Atti della Soc. Ital.*) and of the sun (*Le Soleil*, Paris, 1870, 8vo; 2d ed. 1877). Though his publications always bear witness of his indefatigable zeal and energy, they are often uncritical and wanting in accuracy.

SECKENDORF, VEIT LUDWIG VON (1626-1692), a German statesman and scholar of the 17th century, was the most distinguished member of an ancient and widespread German noble family, which took its name from the village Seckendorf between Nuremberg and Langenzenn, and is said to have been ennobled by the emperor Otho I. in 950, though it traces its own genealogy no further back than 1262. The family was divided into eleven distinct lines, but at present only three are preserved, widely distributed throughout Prussia, Würtemberg, and Bavaria.¹ Veit Ludwig von Seckendorf, son of Joachim Ludwig, of the Gudentine line, was born at Herzogenaurach (near Erlangen) in Upper Franconia, 20th December 1626. His youth fell in the midst of the Thirty Years' War, in which his father was actively

¹ Amongst the Seckendorfs less known to fame than Veit Ludwig are his nephew, Friedrich Heinrich (1673-1763), soldier and diplomatist; Leo (1773-1809), poet, literary man, and soldier; the brothers Christian Adolf (1767-1833) and Gustav Anton ("Patrik Peale") (1775-1823), both literary men of some note.

engaged. But his talented and noble mother carefully watched over his education. In Coburg, Mühlhausen, and finally in Erfurt, whither his mother removed in 1636, he acquired the Latin, Greek, and French languages. In 1639 he returned to Coburg, and the reigning duke, Ernest the Pious, made him his *protégé*. Entering the university of Strasburg in 1642, he devoted himself to history and jurisprudence. After he finished his university course his patron gave him an appointment in his court at Gotha, with the charge of his valuable library. He there laid the foundation of his great collection of historical materials and mastered the principal modern languages. In 1652 he was appointed to important judicial positions and sent on weighty embassages. In 1656 he was made judge in the ducal court at Jena, a position which he held many years and in which he took the leading part in the numerous beneficent reforms of the duke. In 1664 he resigned office under Duke Ernest, who had just made him chancellor and with whom he continued on excellent terms, and entered the service of Duke Maurice of Zeitz (Altenburg), with the view of lightening his official duties. After the death of Maurice in 1681 he retired to his estate, Meuselwitz in Altenburg, from nearly all public offices, and devoted himself to his intellectual labours. Although living in retirement, he kept up a correspondence with the principal learned men of the day. He was especially interested in the endeavours of the pietist Spener to effect a practical reform of the German church, although he was hardly himself a pietist. In 1692 he was appointed chancellor of the new university of Halle, but died a few weeks afterwards, on the 18th of December.

Seckendorf's principal works were the following:—*Deutscher Fürstenstaat* (1656 and often afterwards), a handbook of German public law; *Der Christenstaat* (1685), partly an apology for Christianity and partly suggestions for the reformation of the church, founded on Pascal's *Pensées* and embodying the fundamental ideas of Spener; *Commentarius historicus et apologeticus de Lutheranismosive de Reformatione* (3 vols., Leipsic, 1692) occasioned by the Jesuit Maimbourg's *Histoire du Luthérisme* (Paris, 1680), his most important work, and still indispensable to the historian of the Reformation as a rich storehouse of authentic materials.

See D. G. Schreiber's *Historia vitæ ac meritorum Viti Ludovici a Seckendorff* (Leipsic, 1733); Schröckh, *Lebensbeschreibungen berühmter Männer* (Leipsic, 1790); Nasemann, "Veit Ludwig von Seckendorf," in *Preussische Jahrbücher* (vol. xii., 1868, p. 257 sq.); W. Roscher, "Zwei sächsische Staatswirthe im 16ten und 17ten Jahrhundert," in *Weber's Archiv für die sächsische Geschichte* (vol. i., 1862); and Theodor Kolde, "Seckendorf," in *Herzog-Plitt's Realencyklopädie* (1884).

SECRETARY-BIRD, a very singular African animal first accurately made known, from an example living in the menagerie of the prince of Orange, in 1769 by Vosmaer,¹ in a treatise published simultaneously in Dutch and French, and afterwards included in his collected works issued, under the title of *Regnum Animale*, in 1804. He was told that at the Cape of Good Hope this bird was known as the "Sagittarius" or Archer, from its striding gait being thought to resemble that of a bowman advancing to shoot, but that this name had been corrupted into that of "Secretarius." In August 1770 Edwards saw an example (apparently alive, and the survivor of a pair which had been brought to England) in the possession of Mr

Raymond near Ilford in Essex; and, being unacquainted with Vosmaer's work, he figured and described it as "of a new genus" in the *Philosophical Transactions* for the following year (lxi. pp. 55, 56, pl. ii.). In 1776 Sonnerat (*Voy. Nouv. Guinée*, p. 87, pl. 50) again described and

Secretary-Bird.

figured, but not at all correctly, the species, saying (but no doubt wrongly) that he found it in 1771 in the Philippine Islands. A better representation was given by D'Aubenton in the *Planches Enluminées* (721); in 1780 Buffon (*Oiseaux*, vii. p. 330) published some additional information derived from Querhoent, saying also that it was to be seen in some English menageries; and the following year Latham (*Synopsis*, i. p. 20, pl. 2) described and figured it from three examples which he had seen alive in England. None of these authors, however, gave the bird a scientific name, and the first conferred upon it seems to have been that of *Falco serpentarius*, inscribed on a plate bearing date 1779, by John Frederick Miller (*Ill. Nat. History*, xxviii.), which plate appears also in Shaw's *Cimelia Physica* (No. 28) and is a misleading caricature. In 1786 Scopoli called it *Otis secretarius*—thus referring it to the Bustards,² and Cuvier in 1798 designated the genus to which it belonged, and of which it still remains the sole representative,³ *Serpentarius*. Succeding systematists have, however, encumbered it with many other names, among which the generic terms *Gypogeryan* and *Ophiotheres*, and the specific epithets *reptilivorus* and *cristatus*, require mention here.⁴ The Secretary-bird is of remarkable appearance, standing nearly 4 feet in height, the great length of its legs giving it a resemblance to a Crane or a Heron; but the expert will at once notice that, unlike those birds, its tibiae are feathered all the way down. From the back of the head and the nape hangs, loosely and in pairs, a series of black elongated feathers, capable of erection and dilation in periods of excitement.⁵

¹ Curiously enough, Boddaert in 1783 omitted to give it a scientific name.

² Ogilby's attempt to distinguish three species (*Proc. Zool. Society*, 1835, pp. 104, 105) has met with no encouragement; but examples from the north of the equator are somewhat smaller than those from the south.

³ The scientific synonymy of the species is given at great length by Drs Finsch and Hartlaub (*Vögel Ost-Afrikas*, p. 93) and by Mr Sharpe (*Cat. B. Brit. Museum*, i. p. 45); but each list has some errors in common.

⁴ It is from the fancied resemblance of these feathers to the pens which a clerk is supposed to stick above his ear that the bird's name of Secretary is really derived.

⁵ Le Vaillant (*Sec. Voy. Afrique*, ii. p. 273) truly states that Kolben in 1719 (*Caput Bonæ Spei hodiernum*, p. 182, French version, ii. p. 198) had mentioned this bird under its local name of "Snake-eater" (*Slangen-vreter*, Dutch translation, i. p. 214); but that author, who was a bad naturalist, thought it was a Pelican and also confounded it with the Spoonbill, which is figured to illustrate his account of it. Though he doubtless had seen, and perhaps tried to describe, the Secretary-bird, he certainly failed to convey any correct idea of it. Latham's suggestion (*loc. infra cit.*) that the figure of the "Grus Capensis cauda cristata" in Petiver's *Gazophylacium* (tab. xii. fig. 12) was meant for this bird is negated by his description of it (p. 20). The figure was probably copied from one of Sherard's paintings and is more likely to have had its origin in a Crane of some species. Vosmaer's plate is lettered "Amerikaanischen Roof-Vogel," of course by mistake for "Afrikaanischen."

The skin round the eyes is bare and of an orange colour. The head, neck, and upper parts of the body and wing-coverts are bluish-grey; but the carpal feathers, including the primaries, are black, as also are the feathers of the vent and tibiae,—the last being in some examples tipped with white. The tail-quills are grey for the greater part of their length, then barred with black and tipped with white; but the two middle feathers are more than twice as long as those next to them, and drooping downwards present a very unique appearance.

The habits of the Secretary-bird have been very frequently described, one of the best accounts of them being by Verreaux in the Zoological Society's *Proceedings* for 1856 (pp. 348-352). Its chief prey consists of insects and reptiles, and as a foe to snakes it is held in high esteem. Making every allowance for exaggeration, it seems to possess a strange partiality for the destruction of the latter, and successfully attacks the most venomous species, striking them with its knobbed wings and kicking forwards at them with its feet, until they are rendered incapable of offence, when it swallows them. The nest is a huge structure, placed in a bush or tree, and in it two white eggs, spotted with rust-colour, are laid. The young remain in the nest for a long while, and even when four months old are unable to stand upright. They are very frequently brought up tame, and become agreeable not to say useful pets about a house, the chief drawbacks to them being that when hungry they will help themselves to the small poultry, and the fragility of their legs, which follows on any sudden alarm, and ends in their death. The Secretary-bird is found, but not very abundantly and only in some localities, over the greater part of Africa, especially in the south, extending northwards on the west to the Gambia and in the interior to Khartum, where Von Heuglin observed it breeding.

The systematic position of the genus *Serpentarius* has long been a matter of discussion, and is still one of much interest, though of late classifiers have been pretty well agreed in placing it in the Order *Accipitres*. Most of them, however, have shown great want of perception by putting it in the Family *Falconidae*. No anatomist can doubt its forming a peculiar Family, *Serpentariidae*, differing more from the *Falconidae* than do the *Vulturidae*; and the fact of Prof. A. Milne-Edwards having recognized in the Miocene of the Allier the fossil bone of a species of this genus, *S. robustus* (*Ois. foss. France*, ii. pp. 465-468, pl. 186, figs. 1-6), proves that it is an ancient form, one possibly carrying on a direct and not much modified descent from a generalized form, whence may have sprung not only the *Falconidae* but perhaps the progenitors of the *Ardeidae* and *Ciconiidae*, as well as the puzzling *Cariacidae* (*SERIEMA*, q.v.). (A. N.)

SECULAR GAMES were celebrated at Rome for three days and nights with great ceremony to mark the commencement of a new *saeculum* or generation. Originally they were a propitiatory festival, imported from Etruria under the name of Ludi Terentini, and held at irregular intervals, in view of extraordinary prodigies; but in 249 B.C. it was decreed that they should be celebrated in every hundredth year after that date. This decree was frequently disregarded, partly for political reasons and partly because in Augustus's time and with his approval the quindecimviri, acting under Greek influence, sanctioned the longer period of 110 years.

The dates of the actual celebrations are as follows:—the first in 509 B.C., the second in 348, the third in 249, the fourth in 146, the fifth by Augustus in 17 (for this occasion Horace wrote his *Carmen Saeculare*), the sixth by Claudius in 47 A.D.=800 A.U.C., the seventh by Domitian in 88, the eighth by Antoninus Pius in 147=900 A.U.C., the ninth by Severus in 204 (220 years after the Augustan celebration), the tenth by Philip in 248, the eleventh and last by Gallienus c. 262. The projected celebration of Maximian in 304 did not take place.

Censorinus, *De Die Natali*, c. 17; Zosimus, ii. 1 sq.; Val. Max., ii. c. 5. The dates of the first two celebrations appear to rest only on the authority of Valerius Antias; the others are certain. The quindecimviral books assigned fictitious dates for the pre-Augustan celebrations. Comp. Marquardt, *Die römische Staatsverwaltung*, iii. p. 369 sq.

SECUNDERÁBÁD, one of the chief British military cantonments in India, is situated in the native state of Haidarábád (Hyderabad) or the Nizam's Dominions, in 17° 26' 30" N. lat. and 78° 33' E. long., 1830 feet above the level of the sea, and 6 miles north-east of Haidarábád city. Secunderábád is the largest military station in India and forms the headquarters of the Haidarábád subsidiary

force, which constitutes a division of the Madras army. The strength of the military force stationed at Secunderábád in 1883 was 5632, European troops numbering 2276 and native troops 3356. To the south-west of the cantonment there is a large reservoir or tank, known as the Husain Sagar, about 3 miles in circumference. Secunderábád town, which forms the cantonment bazaar, contains a population of over 30,000. Adjoining this cantonment to the north is the Boláram cantonment, one of the stations of the Haidarábád contingent, under the immediate command of the nizám; and 2 miles to the south of Secunderábád cantonment are the lines of the Haidarábád reformed troops, also belonging to the nizám. During the mutiny (1857-58) both the subsidiary force and the Haidarábád contingent rendered good service.

SECUNDUS, JOHANNES, or JOHANN EVERTS (1511-1536), Latin poet, was born at The Hague on 10th November 1511. He was descended from an ancient and honourable family in the Netherlands; his father, Nicholas Everts, or Everard, seems to have been high in the favour of the emperor Charles V. On what account the son was called Secundus is not known. His father intended him for the law; but though he took his degree at Bourges it does not appear that he devoted much time to legal pursuits. Poetry and the sister arts of painting and sculpture engaged his mind at a very early period. In 1533 he went to Spain, and soon afterwards became secretary to the cardinal-archbishop of Toledo, in a department of business which required no other qualification than that which he possessed in a very eminent degree,—a facility in writing with elegance the Latin language. It was during this period that he composed his most famous work, the *Basia*, a series of amatory poems, of which the fifth, seventh, and ninth *Carmina* of Catullus seem to have given the hint. In 1534 he accompanied Charles V. to the siege of Tunis, but gained few laurels as a soldier. After quitting the service of the archbishop, Secundus was employed as secretary by the bishop of Utrecht; and so much did he distinguish himself by the classical elegance of his compositions that he was called upon to fill the important post of private Latin secretary to the emperor, who was then in Italy. But, having arrived at St Amand, near Tournay, he was cut off by a violent fever on 8th October 1536.

SEDAINE, MICHEL JEAN (1719-1797), dramatist, was born at Paris on 4th July 1719. Few men of letters have risen from a lower station. Although his father was an architect, he died when Sedaine was quite young, leaving no fortune, and the boy began life as a mason's labourer. He worked himself up in his trade and was at last taken as pupil and partner by the builder who employed him. Meanwhile he had done his best to repair his deficiencies of education, and in 1753 he published a volume of poems of some merit. He then took to the theatre and after composing various vaudevilles and operettas attracted the attention of Diderot, and had two remarkable plays accepted and performed at the Théâtre Français. The first and longest, the *Philosophe sans le Savoir*, was acted in 1765; the second, a lively one-act piece, *La Gageure Imprévue*, in 1768. These two at once took their place as stock pieces and are still ranked among the best French plays, each of its class. Sedaine inclined somewhat to the school of *drame* or *tragédie bourgeoise*, but he was free from the excessive sentimentality which in the hands of Diderot and others marred the style, and he had a vein of singularly natural and original comedy. Indeed his originality is one of his chief points, though except the two pieces mentioned little or nothing of his has kept the stage or the shelves. Sedaine, who became a member of the Academy, secretary for architecture of the fine arts division, and a prosperous man generally, was personally

both popular and respected. He lived to a considerable age, dying at Paris on 17th May 1797.

SEDALIA, a city of the United States, county town of Pettis county, Missouri, lies 189 miles west of St Louis, on the highest swell of a rolling prairie, which drains by small streams north-east to the Missouri. It is a railroad centre, and, besides the machine-shops and carriage-factories of two railway companies (the Missouri, Kansas, and Texas, and the Missouri Pacific, Middle Division), it contains foundries, flour-mills, and establishments for the manufacture of furniture, woollen goods, soap, beer, &c. Among the public buildings are two opera-houses, a public library, a high school, and a gymnasium. Founded in 1860 by General George R. Smith, Sedalia had 4560 inhabitants in 1870, and 9561 in 1880.

SEDAN, a town of France, the chef-lieu of an arrondissement in the department of Ardennes, lies on the right bank of the Meuse, 13 miles east-south-east of Mézières by the railway to Thionville (Lorraine), and is surrounded by heights of about 1000 feet. Since its fortifications were *déclassés*, a process of embellishment has been going on. Place Turenne takes its name from the statue of the illustrious marshal, who was born in the town in 1611. The public buildings include a Protestant church, a synagogue, a museum, and a college. The manufacture of fine black cloth has long been, and still continues to be, the staple industry, employing in the town and neighbourhood more than 10,000 workmen, and producing to the value of 40,000,000 francs annually. Several spinning-mills have been erected by Alsatian refugees since 1871. Considerable activity is also displayed in various departments of metal-working, especially in the surrounding villages. The population was 13,807 in 1872, and 19,240 in 1881 (19,556 in the commune).

Sedan was in the 13th century a dependency of the abbey of Mouzon, the possession of which was disputed by the bishops of Liège and Rheims. United to the crown of France by Charles V., it was ceded by Charles VI. to Guillaume de Braquemont, who sold it to the La Marcks. For two centuries this powerful family managed to continue masters of the place in spite of the bishops of Liège and the dukes of Burgundy and Lorraine; and in the person of Henri Robert they adopted the title "prince of Sedan." In the 16th century the town was an asylum for many Protestant refugees, who laid the basis of its industrial prosperity, and it became the seat of a Protestant seminary. The last heiress of the La Marck family brought Sedan and the duchy of Bouillon to Henri de la Tour d'Auvergne, viscount of Turenne. When the new duke attempted to maintain his independence, Henry IV. captured Sedan in three days; and the second duke (eldest brother of the great marshal), who had several times revolted against Louis XIII., was at last, after his share in the conspiracy of Cinquars, obliged to surrender his principality. Sedan thus became part of the royal domain in 1641. On 1st September 1870 the fortress was the centre of the most disastrous conflict of the Franco-German War. Shut in by the Germans, who had occupied the surrounding heights, the whole French army, after a terrific contest, was obliged to capitulate,—the emperor, 39 generals, 230 staff-officers, 2600 officers, and 83,000 men becoming prisoners of war. The village of Bazeilles was the scene of the heroic stand made by the marines under Martin des Pallières. It now contains the great ossuary, and a monument to the memory of the marines; and the house which has been rendered famous by Neuville's painting, "Les Dernières Cartouches," is a museum of objects found on the battlefield.

SEDDON, THOMAS (1821-1856), landscape painter, was born in London on 28th August 1821. His father was a cabinetmaker, and the son for some time followed the same occupation; but in 1842 he was sent to Paris to study ornamental art. On his return he executed designs for furniture for his father, and in 1848 gained a silver medal from the Society of Arts. In the following year he made sketching expeditions in Wales and France, and in 1852 began to exhibit in the Royal Academy, sending a figure-piece, Penelope, and afterwards landscapes, deriving their subjects from Brittany. In the end of 1853 he started for the East and joined Mr Holman Hunt at Cairo. He worked

for a year in Egypt and Palestine, executing views which Mr Ruskin has pronounced to be "the first landscapes uniting perfect artistical skill with topographical accuracy; being directed, with stern self-restraint, to no other purpose than that of giving to persons who cannot travel trustworthy knowledge of the scenes which ought to be most interesting to them." Seddon's Eastern subjects were exhibited in Berners Street, London, in 1855, and in Conduit Street in 1856. In October 1856 Seddon again visited Cairo, where, after a very brief illness, he died on 23d November. In 1857 his works were collected and exhibited in the rooms of the Society of Arts, and his important and elaborately finished picture, Jerusalem and the Valley of Jehoshaphat, was purchased by subscription and presented to the National Gallery. A memoir of Seddon, by his brother, was published in 1859.

SEDGWICK, ADAM (1785-1873), geologist, was born in 1785 at Dent, Yorkshire, where his father was vicar of the parish. He was educated at Sedbergh school and at Trinity College, Cambridge, where he graduated as fifth wrangler in 1808, and was elected a fellow in 1809. For some years he devoted himself chiefly to the studies and duties of academic life, but gradually he acquired an absorbing interest in geology and natural science, which was fostered by long excursions into the country, rendered necessary by the state of his health. In 1818 he succeeded Professor Hailstone in the Woodwardian chair of geology. Among his principal discoveries, which appeared for the most part in the *Cambridge Transactions* and the *Transactions of the Geological Society*, were those of the true position and succession of the Palæozoic strata of Devonshire and Cornwall, of the geological relation of the beds afterwards named Permian in the north and north-west of England, and of the general structure of North Wales,—a subject which led him into controversy with Murchison. In 1834 he published a *Discourse on the Studies of the University of Cambridge*, which reached a fifth edition. By his generosity and energy he succeeded in rendering the geological collection of the Woodwardian Museum one of the most complete in the kingdom. He was one of the original secretaries of the Cambridge Philosophical Society established in 1819, and was president of the Geological Society of London from 1829 to 1831. Having taken holy orders, he was advanced to the dignity of canon of Norwich cathedral, and for some time also he was vice-master of Trinity College. Sedgwick died at Cambridge on 25th January 1873.

SEDITION in Roman law was considered as *majestas* or treason. In English law it is a very elastic term, including offences ranging from libel to TREASON (*q.v.*). It is rarely used except in its adjectival form, *e.g.*, seditious libel, seditious meeting, or seditious conspiracy. "As to sedition itself," says Mr Justice Stephen, "I do not think that any such offence is known to English law" (*Hist. Crim. Law*, vol. ii. chap. xxiv.).¹ The same high authority lays down the law in the following terms, which were substantially adopted by the Draft Criminal Code Commissioners.

"Every one commits a misdemeanour who publishes verbally or otherwise any words or any document with a seditious intention. If the matter so published consists of words spoken, the offence is called the speaking of seditious words. If the matter so published is contained in anything capable of being a libel, the offence is called the publication of a seditious libel. Every one commits a misdemeanour who agrees with any other person or persons to do any act for the furtherance of any seditious intention common to both or all of them. Such an offence is called a seditious conspiracy. A seditious intention is an intention to bring into hatred or contempt or to excite disaffection against the person of Her Majesty, her heirs and successors, or the Government and constitution of the

¹ The word "sedition" occurs, however, in 40 and 41 Vict. c. 21, s. 40.

United Kingdom, as by law established, or either House of Parliament, or the administration of justice, or to excite Her Majesty's subjects to attempt otherwise than by lawful means the alteration of any matter in church or state by law established, or to raise discontent or disaffection amongst Her Majesty's subjects, or to promote feelings of ill-will and hostility between different classes of Her Majesty's subjects. An intention to show that Her Majesty has been misled or mistaken in her measures, or to point out errors or defects in the Government or constitution as by law established, with a view to their reformation, or to excite Her Majesty's subjects to attempt by lawful means the alteration of any matter in church or state by law established, or to point out, in order to their removal, matters which are producing or have a tendency to produce feelings of hatred and ill-will between different classes of Her Majesty's subjects, is not a seditious intention. In determining whether the intention with which any words were spoken, any document was published, or any agreement was made, was or was not seditious, every person must be deemed to intend the consequences which would naturally follow from his conduct at the time and under the circumstances in which he so conducted himself" (*Digest of the Criminal Law*, §§ 91-94).

The principal enactments now in force dealing with seditious offences were all passed during the last twenty-five years of the reign of George III. They are 37 Geo. III. c. 123, prohibiting the administering or taking of unlawful oaths (see OATH) or the belonging to an unlawful confederacy; 60 Geo. III. and 1 Geo. IV. c. 1, prohibiting unlawful drilling and military exercises; and the Acts for the suppression of corresponding societies, 39 Geo. III. c. 79 and 57 Geo. III. c. 19. No proceedings can be instituted under these last two Acts without the authority of the law officers of the crown (9 and 10 Vict. c. 33). Under the head of statutes aimed at seditious offences may also be classed 2 Ric. II. st. 1, c. 5 and 12 Ric. II. c. 11, against *scandalum magnatum* or slander of great men, such as peers, judges, or great officers of state, whereby discord may arise within the realm, and 13 Car. II. c. 5, against tumultuous petitioning (see PETITION). There has been no prosecution in recent times for seditious words as distinguished from seditious libel, but such words have been admitted as evidence in proceedings for seditious CONSPIRACY (*q.v.*), as in the prosecution of O'Connell in 1844 and of Mr Parnell and others in 1880 (see *Reg. v. Parnell*, Cox's *Criminal Cases*, vol. xiv. 508). By the Prison Act, 1877, any prisoner under sentence for sedition or seditious libel is to be treated as a misdemeanant of the first division (40 and 41 Vict. c. 21, s. 40).

Scotland.—"All acts by which the minds of the people may be incited to defeat the Government or control legislation by violent or unconstitutional means are seditious" (Macdonald, *Criminal Law*, 229). Sedition is punishable by fine or imprisonment or both (6 Geo. IV. c. 47). A very large number of Acts of the Scottish Parliament dealt with sedition, beginning as early as 1184 with the assize of William the Lion, c. 29. Leasing-making is to be distinguished from sedition, as it attacked only the sovereign individually, not the Government.

United States.—In the Acts of Congress the word "sedition" appears to occur only in the army and navy articles. A soldier joining any sedition or who, being present at any sedition, does not use his utmost endeavour to suppress the same is punishable with death. A sailor uttering seditious words is punishable at the discretion of a court-martial. In 1798 an Act of Congress called the Sedition Act was passed, which expired by effluxion of time in 1801. Its constitutionality was violently assailed at the time. (See Story on the constitution of the United States, §§ 1293-4.) Several prosecutions under the Act will be found in Wharton's *State Trials*. Sedition is also dealt with by the State laws mostly in a very liberal spirit. Thus the Louisiana Code, § 394, enacts that "there is no such offence known to our law as defamation of the Government or either of its branches, either under the name of libel, slander, seditious writing, or other appellation." By § 111, to constitute the offence of sedition "there must be not only a design to dismember the State, or to subvert or change its constitution, but an attempt must be made to do it by force."

Continent of Europe.—The Continental codes as a rule are little more definite than English law in their treatment of sedition. In Germany a distinction is drawn between *Auflauf*, the remaining together of a mob after the authorities have thrice bid it disperse, and *Aufbruch* or *Aufstand*, an organized resistance to the authorities; but no definition is given of the terms. The Hungarian

penal code defines *Aufstand* to be an armed assembly which has the intention of attacking a class of citizens, a nationality, or a religious body. The French penal code recognizes a difference between *sédition* and *réunion séditieuse*. If carried out with sufficient numbers and sufficient force *sédition* becomes *rébellion*. Section 100 exempts from the penalties of sedition those who have merely been present at a seditious meeting without taking any active part therein, and have dispersed at the first warning of the military or civil authorities.

SEDLEY, SIR CHARLES (1639-1701), a noted "wit" and patron of literature in the Restoration period, the "Lisideius" of Dryden's *Essay of Dramatic Poesy*. He was born in 1639, the son of Sir John Sedley of Aylesford in Kent. Like many other men of rank and fashion at the court of "the merry monarch," Sedley had poetical ambition, and wrote comedies and songs. His most famous song, "Phyllis," is much more widely known now than the author's name. His first comedy, *The Mulberry Garden*, was published in 1668, but it does not sustain Sedley's contemporary reputation for wit in conversation. He was probably too indolent to master the art of providing continuous opportunities for brilliant sayings, although he continued to try, wrote two more comedies, and left a comedy and two tragedies behind him to be published after his death. An indecent frolic in Bow Street, for which he was heavily fined, made him notorious in his youth, but later on he sobered down, entered parliament for New Romney (Kent), and took an active part in politics. A speech of his on the civil list after the Revolution is cited by Macaulay as a proof (which his plays do not afford) that his reputation as a man of wit and ability was deserved. His *bon mot* at the expense of James II. is another well-known fragment of his wit. The king had seduced his daughter and created her countess of Dorchester, whereupon Sedley remarked that he hated ingratitude, and, as the king had made his daughter a countess, he would endeavour to make the king's daughter a queen. Sedley died on 20th August 1701.

SEDUCTION. The action for seduction of an unmarried woman in England stands in a somewhat anomalous position. The theory of English law is that the woman herself has suffered no wrong; the wrong has been suffered by the parent or person *in loco parentis*, who must sue for the damage arising from the loss of service caused by the seduction of the woman. Some evidence of service must be given, but very slight evidence will be sufficient. Although the action is nominally for loss of service, still exemplary damages may be given for the dishonour of the plaintiff's family beyond recompence for the mere loss of service. An action for seduction cannot be brought in the county court except by agreement of the parties. As to seduction of a married woman, the old action for criminal conversation was abolished by the Divorce Act, 1857, which substituted for it a claim for damages against the co-respondent in a divorce suit. Seduction in England is not as a rule a criminal offence. But a conspiracy to seduce is indictable at common law. And the Criminal Law Amendment Act, 1885 (which extends to the United Kingdom), makes it felony to seduce a girl under the age of thirteen, and misdemeanour to seduce a girl between thirteen and sixteen (48 and 49 Vict. c. 69, §§ 4, 5). The same Act also deals severely with the cognate offences of procuration, abduction, and unlawful detention with the intent to seduce a woman of any age. In Scotland the seduced woman may sue on her own account.

United States.—In the United States State legislation has generally modified the common law. In some States the father brings the action as the representative of the family whose purity has been invaded; in others the woman herself may bring the action. In many States there is a criminal as well as a civil remedy. The penal codes of New York, New Jersey, Louisiana, and other States make it a crime to seduce under promise of marriage an unmarried woman of good reputation. Subsequent intermarriage of the parties

is in most cases a bar to criminal proceedings. Massachusetts goes still further. By the law of that State if a man commits fornication with a single woman, each of them shall be punished by imprisonment not exceeding three months, or by fine not exceeding \$30. The seduction of a female passenger on a vessel of the United States is an offence punishable by fine or imprisonment. The fine may be ordered by the court to be paid to the person seduced or her child (Act of Congress of 24th March 1860). The State legislation of the United States is in remarkable opposition to the rule of the canon law, by which the seduction of a woman by her betrothed was not punishable on account of the inchoate right over her person given by the betrothal.

SEDULIUS, CÆLIUS, a Christian poet of the 5th century, was the author of an abecedarian *Hymnus de Christo* in iambic dimeters, portions of which maintain their ground in the offices of the Church of Rome, viz., in the Christmas hymn "A solis ortus cardine," and in that for Epiphany (altered from "Herodes hostis impie"). His other works are *Paschale Carmen s. Mirabilium Divinorum Libri V.*, originally in four or five books in hexameter verse and afterwards enlarged and turned into prose, and *Veteris et Novi Testamenti Collatio*, in elegiac verse. *De Verbi Incarnatione*, a Virgilian cento, has also been ascribed to him, but on insufficient grounds. Of his personal history nothing is known, except that he is called a presbyter by Isidore of Seville; by some other writers of less authority he is designated "antistes" or "episcopus." A Scot-Irish origin has sometimes been claimed for him; but at all events he must not be confounded with Sedulius the grammarian, an Irish Scot who lived in the 9th century. The best edition of his works is that of Arevalus (4to, Rome, 1794).

SEDUM. About 120 species are enumerated in this genus of *Crassulaceæ*, mostly perennial herbs with succulent leaves of varied form, but never compound. The individual flowers are usually small and grouped in cymes. In colour they range from white and yellow to pink. They have a calyx of five sepals, as many petals, usually ten stamens, and five distinct carpels, which have as many glands at their base and ripen into as many dry seed-pods. Several species are British, including some with tuberous roots and large leaves (*Telephium*), and others of smaller size, chiefly found on rocks, walls, and dry banks. Many are cultivated for the beauty of their flowers, and many are remarkable for their prolonged vitality under adverse circumstances. Sedums are very closely allied to *Semprevivum* (see **HOUSELEEK**).

SEELAND. See **ZEALAND**.

SÉES, a town of France and a bishop's see, in the department of Orne, is situated on the Orne, 4 miles from its source and 13 miles north of Alençon by the railway from Le Mans to Caen. The very fine cathedral, dating to a large extent from the 13th and 14th centuries, occupies the site of churches founded in 440, 996, and 1053. The west front has two stately spires of open work 230 feet high, which have been restored more than once in the 19th century. The nave, built in the beginning of the 13th century, was remodelled in its upper portion fifty or sixty years after its erection; the choir, built about 1230 and restored in 1260 after a great fire, is remarkable for the lightness of its construction,—the inner galleries of the presbytery being the boldest venture ever made in this kind. In the choir are four bas-reliefs of great beauty and delicacy representing scenes in the life of the Virgin; and the altar is adorned with another depicting the removal of the relics of St Gervais and St Protas. Most of the stained windows are good. Around the cathedral are the cloisters of the canons; the episcopal palace (1778), with a pretty chapel; the great seminary, located in the old abbey of St Martin (supposed to be one of the fourteen or fifteen monasteries founded in the 6th century by St Evroult); the hôtel de ville; and the statue of Conté, a member of

the Egyptian expedition of 1798. The population of Sées was 3483 in 1881, and that of the commune 4687.

The first bishop of Sées (*Sagium*) was St Lain, who lived at the close of the 3d or beginning of the 4th century. In the 9th century it was a fortified town and fell a prey to the Normans; and the stones from its ruined ramparts were used for the erection of a church in the close of the 10th century. In the 12th century Sées belonged to the count of Alençon and consisted of two distinct parts, separated by the Orne,—the bishop's burgh, and to the south the new or count's burgh (*Bourg le Comte*). Captured in 1154 by Henry II. of England, it was recovered in the following year by Guillaume de Bellême; and in 1136 it was partly burned by the count of Anjou. After being taken by Philip Augustus it enjoyed some years of peace, during which a hospital and a Franciscan monastery were built; but it was one of the first towns of Normandy to fall into the hands of the English (1417), who retained possession until their final expulsion from France. Pillaged by the Protestants during the Wars of Religion, Sées attached itself to the League in 1589, but voluntarily surrendered to Henry IV. in 1590.

SEETZEN, ULRICH JASPER (1767-1811), one of the most distinguished of modern travellers in the East, was born the son of a yeoman, in the little lordship of Jever in German Frisia, on 30th January 1767. His father, who was a man of substance, sent him to the university of Göttingen, where he graduated in medicine. His chief interests, however, were in natural history and technology; he wrote a number of papers on both these subjects which gained him some reputation, and had both in view in a series of journeys which he made from time to time through various parts of Holland and Germany. He also engaged practically in various small manufactures, and in 1802 obtained a Government post in Jever. In 1801, however, the interest which he had long felt in geographical exploration had culminated in a resolution to travel by Constantinople to Syria and Arabia, and then, when familiarized with Mohammedan ways, to try to penetrate into Central Africa. He relied mainly on his own resources, but received a small subvention from Gotha, where also he learned from Zach to make astronomical observations. In the summer of 1802 he started down the Danube with a companion Jacobsen, who broke down at Smyrna a year later. His journey was by Constantinople, where he stayed six months, thence through Asia Minor to Smyrna, then again through the heart of Asia Minor to Aleppo, where he remained from November 1803 to April 1805, and made himself sufficiently at home with Arabic speech and ways to travel as a native and without an interpreter. Now began the part of his travels of which a full journal has been published (April 1805 to March 1809), a series of most instructive journeys in eastern and western Palestine and the wilderness of Sinai, and so on to Cairo and the Fayyûm. His chief exploit was a tour round the Dead Sea, which he made without a companion and in the disguise of a beggar. From Egypt he went by sea to Jeddah and reached Mecca as a pilgrim in October 1809. In Arabia he made extensive journeys, ranging from Medina to Lahak and returning to Mocha, from which place his last letters to Europe were written in November 1810. In September of the following year he left Mocha with the hope of reaching Muscat, and was found dead two days later, having, it is believed, been poisoned by the command of the imâm of Sana'a. For the parts of Seetzen's journeys not covered by the published journal (*Reisen*, ed. Kruse, 4 vols., Berlin, 1854) the only printed records are a series of letters and papers in Zach's *Monatliche Correspondenz* and Hammer's *Fundgruben*. Many papers and collections were lost through his death or never reached Europe. The collections that were saved form the Oriental museum and the chief part of the Oriental MSS. of the ducal library in Gotha.

SE-GAN FOO, the capital of the province of Shen-se in north-western China, is situated in 34° 17' N. lat. and 108° 58' E. long. Like most Chinese cities, Se-gan Foo has repeatedly changed its name during its history, which dates

back to the time of Che Hwang-te (246-210 B.C.), the first universal emperor, whose name will be ever notorious as that of the monarch who built the Great Wall, burnt the books, and established his capital at Kwan-chung, the site of the modern Se-gan Foo. Under the succeeding Han dynasty (206 B.C.-25 A.D.) this city was called Wei-nan and Nuy-she; under the Eastern Han (25-221 A.D.) it was known as Yung Chow; under the Tang (618-907) as Kwan-nuy; under the Sung (960-1127) as Yung-hing; under the Yuen and Ming (1260-1644) as Gan-se; and under the present dynasty as Se-gan. During the Ts'in, Han, and Tang dynasties it was the capital of the empire, and is at the present time second only to Peking in size, population, and importance. The city, which is a square, measuring 10 Chinese miles each way, is prettily situated on ground rising from the river Wei, and includes within its limits the two district cities of Ch'ang-gan and Hien-ning. Its walls are little inferior in height and massiveness to those of Peking, while its gates are handsomer and better defended than any of which the capital can boast. The population is said to be 1,000,000, of whom 50,000 are Mohammedans. Situated in the basin of the Wei river, along which runs the great road which connects northern China with Central Asia, at a point where the valley opens out on the plains of China, Se-gan Foo occupies a strategical position of great importance, and repeatedly in the annals of the empire has history been made around and within its walls. During the late Mohammedan rebellion it was besieged by the rebels for two years (1868-70), but owing to the strength of the fortifications it defied the efforts of its assailants. From its eastern side three great roads radiate, one reaching to Shan-se, one to Ho-nan, and one to Hoo-pih; while from it runs in a south-westerly direction the great highway into Sze-chuen. It is thus admirably situated as a trade centre and serves as a depôt for the silk from Che-keang and Sze-chuen, the tea from Hoo-pih and Ho-nan, and the sugar from Sze-chuen destined for the markets of Kansuh, Turkistan, Ili, and Russia. Marco Polo speaking of Kenjanfu, as the city was then also called, says that it was a place "of great trade and industry. They have great abundance of silk, from which they weave cloths of silk, and gold of divers kinds, and they also manufacture all sorts of equipments for an army. They have every necessary of man's life very cheap." Many of the temples and public buildings are very fine, and not a few historical monuments are found within and about the walls. Of these the most notable is a Nestorian tablet,¹ which was accidentally discovered in 1625 in the Ch'ang-gan suburb.

¹ The contents of this Nestorian inscription, which consists of 1780 characters, may be described as follows. (1) An abstract of Christian doctrine of a vague and figurative kind. (2) An account of the arrival of the missionary Olopun (probably a Chinese form of Rabban = Monk), from Tats'in in the year 635, bringing sacred books and images; of the translation of the said books; of the imperial approval of the doctrine and permission to teach it publicly. Then follows a decree of the emperor (T'ait-sung, a very famous prince), issued in 638, in favour of the new doctrine, and ordering a church to be built in the square of justice and peace (*Ying fang*) in the capital. The emperor's portrait was to be placed in this church. After this comes a description of Tats'in, and then some account of the fortunes of the church in China. Kaoutsung (650-683, the devout patron also of the Buddhist traveller and doctor, Hwen Ts'ang), it is added, continued to favour the new faith. In the end of the century Buddhism got the upper hand, but under Yuen-tsung (713-755) the church recovered its prestige, and Kihō, a new missionary, arrived. Under Tih-tsung (780-783) the monument was erected, and this part of the inscription ends with a eulogy of I-sze, a statesman and benefactor of the church. (3) Then follows a recapitulation of the above in octosyllabic verse. The Chinese inscription, which concludes with the date of erection, viz., 781, is followed by a series of short inscriptions in Syriac and the *Estrangelo* character, containing the date of the erection, the name of the reigning Nestorian patriarch, Mar Hanan Ishua, that of Adam, bishop and pope of China, and those of the clerical staff of the capital. Then follow

The stone slab which bears the inscription is 7½ feet high by 3 wide, and at present stands embedded in a brick wall, which forms part of a dilapidated temple.² From a Chinese point of view, however, the Pei Lin or "forest of tablets" is a place of even greater interest than the above-mentioned temple. For there are collected tablets of the Han, Tang, Sung, Yuen, and Ming dynasties, some of which bear historical legends, notably a set of stone tablets having the thirteen classics inscribed upon them, while others are symbolical or pictorial; among these last is a full-sized likeness of Confucius. As might be expected on a site which has played so prominent a part in Chinese history, antiquities are constantly being discovered in the neighbourhood of the city, e.g., rich stores of coins and bronzes, bearing dates ranging from 200 B.C. onwards.

SEGESTA, a very ancient city near the north-western extremity of Sicily, so named by the natives and by the Romans, while the Greeks called it Egesta or Ægesta. Its origin was ascribed by tradition sometimes to Trojan refugees and sometimes to Phocians, followers of Philoctetes; the accounts agree only in making Segesta older than the Greek colonization of Sicily in the 7th century B.C. A tribe named Elymi, distinct from both the Siculi and the Greeks, occupied the country round the city. The scanty references to the history of Segesta show it in continual warfare with the Greek city Selinus from the year 580 B.C. downwards. As early as 426 B.C. it concluded an alliance with Athens; and in 416 a great Athenian fleet sailed to Sicily, ostensibly to aid Segesta against its enemies Selinus and Syracuse, but really to attempt the conquest of the island. After the destruction of the Athenian fleet and army, the Segestans turned to the Carthaginians. But, when Hannibal destroyed Selinus (see SELINUS) in 409 B.C. and Himera, and established the Carthaginian power firmly in the western part of Sicily, Segesta sank to the position of a dependent ally. In 397 it suffered a long siege from Dionysius of Syracuse, but at last was relieved by Himilco. In 307, however, the Greek arms had better success; Agathocles of Syracuse sold the inhabitants into slavery, after massacring 10,000 men, and changed the name of the city to Diceopolis. But it soon recovered its old name and passed again to the Carthaginians. In the beginning of the First Punic War the Segestans murdered the Carthaginian garrison and became allies of Rome. Being soon after besieged by the Carthaginians, they were relieved by the great naval victory of Duilius, 260 B.C. Segesta was always highly favoured by the Romans, both on account of its early adhesion to their cause and from its supposed Trojan origin. Its site is now deserted, having been exposed to the Saracen depredations in the 10th century; but the ruins are very fine. Segesta was about 6 miles from the sea, and the modern town of Castellamare probably occupies the site of the ancient harbour. The Crimisus, which is represented on coins of Segesta, is probably the river S. Bartolommeo, about 6 miles to the south. There were hot springs and baths not far from the city.

SEGOVIA, a province of Spain, formerly part of Old Castile, is bounded on the N. and N.E. by the provinces of Burgos and Soria, on the S.E. by those of Guadalajara and Madrid, on the S.W. by Avila, and on the N.W. by Valladolid. It has an area of 2670 square miles, and the population in 1877 was 149,961. The greater portion of the country consists of a dry arable tableland, lifted some

sixty-seven names of persons in Syriac characters, most of whom are characterized as priests, and sixty-one names of persons in Chinese, all priests but one.

2500 feet above the sea, monotonous enough in appearance, and burnt to a dull brown during summer, but yet producing some of the finest corn in the Peninsula. Along the whole south-eastern boundary the Guadarrama range of mountains rises up suddenly, like a huge barrier, separating Old from New Castile and the basin of the Douro from that of the Tagus,—affording, too, among its ravines and upon its slopes some remarkably fine scenery. There are two well-known passes or “puertos” over the sierra, those of the Nava Cerrada and of Somosierra. The former has been, until quite a recent date, the chief means of communication with the outer world, save when blocked by winter snows. It winds round the lower southern slope of the Peñalara (8500 feet). The Puerto de Somosierra lies north of the Peñalara. By it in 1808 Napoleon descended upon Madrid. Though to the eye of the stranger almost desert-like in appearance, the province of Segovia is well watered by the streams which rise in the Guadarrama range and flow northwards to the Douro, and by careful methods of irrigation. The Eresma, Cega, Duraton, and Riaza are the principal watercourses. With the exception of Segovia and Sepulveda, there is no town of any importance,—the inhabitants being for the most part employed in agricultural and pastoral pursuits and backward in civilization. Since the completion (1883) of the railway from Medina del Campo to the city of Segovia, however, the towns *en route* have begun to show signs of animation; and, as the province contains monuments of deepest interest to the historian and ecclesiologist, it bids fair to receive its due measure of attention and enlightenment. At the foot of the Nava Cerrada pass lies the royal demesne and summer residence of La Granja, or San Ildefonso, one of the great show places of the Peninsula. The chief trades and manufactures formerly carried on in the province— weaving, tanning, making of earthenware, &c.—have been drawn away to more commercial centres. Paper-making holds its own to some extent, owing to the excellence of the water; and for the same reason, together with the superior quality of the breed of sheep, the picturesque scenes attendant upon the preparation of the fleeces may still be witnessed. Such prosperity, however, as Segovia retains is dependent upon its agricultural produce—wheat, rye, barley, peas, hemp, flax, &c.—together with the rearing of sheep, cattle, mules, and pigs. The sierras yield excellent granite, marble, and limestone; but hitherto the difficulty of transport has prevented any development of mineral wealth.

SEGOVIA, the capital of the above province, clusters upon a narrow ridge of rock which rises in the valley of the Eresma, where this river is joined by its turbulent little tributary the Clamores, and is one of the best specimens extant of the Gotho-Castilian cities. Founded originally as a Roman pleasure resort, it became in the Middle Ages a great royal and religious centre, and was surrounded by Alphonso VI. with the walls and towers which still give to it, even in their dilapidation, the air of a military stronghold. The streets are steep, irregular, and narrow, and are lined with quaint old-fashioned houses as irregular and forbidding, built for the most part of granite from the neighbouring sierra. The place teems with records and monuments of the many vicissitudes of fortune and art through which it has passed, foremost among the latter being the ancient Alcázar, the cathedral, the aqueduct of Trajan, and a notable array of churches and other ecclesiastical edifices. The Alcázar is perched upon the western tip of the long tongue of rock upon which the city is built, and which at this point has a sheer descent upon three sides into the valley. Of the original Middle-Age fortress but little remains save the noble façade,—the building having been wantonly fired in 1862 by the students of the artillery school then domiciled within its walls, and all but destroyed. It

is now in course of slow but praiseworthy restoration. The work is Gotho-Moorish, with an admixture of Renaissance in the decoration. Some of the rooms deserve notice, especially the Sala del Trono and the Sala de Recibimiento. The views obtained over the outlying *vega* from the towers and windows are superb. The 16th-century cathedral (1521-1577), the work of Juan Gil de Ontañón and his son Rodrigo, occupies the site of a former church of the 11th century, of which the present cloisters, rebuilt in 1524, formed part. It is a well-proportioned and delicate piece of Late Gothic—the latest of its kind in Spain—317 feet long by 177 wide. The central nave rises 99 feet and the tower 330. The exterior is the least satisfactory portion, at once bald and over-decorated; the interior is light and pure, with an effectiveness greatly enhanced by some very fine stained glass. The churches of Segovia are legion, though many of them are closed and fast falling into disrepair. The most remarkable are those of La Vera Cruz (Knights Templar, Romanesque of the early 13th century), San Millan and San Juan (both Romanesque of second half of 13th century), El Parral (Gothic of early 16th century), and Corpus Christi, an ancient Jewish sanctuary and an interesting specimen of Moorish work. The towers and external cloistering, or *corredores*, of several of the later churches—especially those of San Estéban and San Martin—are fine. The great aqueduct, however, called El Puente del Diablo, ranks usually as the glory of Segovia, and is remarkable alike for its colossal proportions, its history, its picturesqueness, and the art with which it is put together. Erected first, according to fairly reliable tradition, in the time of the emperor Trajan, and several times barely escaping destruction, it is now, after nearly eighteen hundred years, in perfect working order, bringing the pure waters of the Rio Frio down from the Sierra Fonfria, distant 10 miles to the south. The bridge portion striding across the valley into the city is 847 yards long, and consists of a double tier of superimposed arches, built of rough-hewn granite blocks, laid without lime or cement. The three centre arches are 102 feet in height. Segovia finally lost its ancient prosperity when it was taken and sacked by the French in 1808. Some insignificant manufactories of cloth, leather, paper, and rude earthenware still exist in the suburb of San Lorenzo, but the trade of the place languishes year by year. The city is the see of a bishop, suffragan to Valladolid. The population in 1877 was 11,318.

SEIGNORY, or SEIGNIORY, is the relation of the lord of a fee or a manor to his tenant. There is no land in England without its lord: “Nulle terre sans seigneur” is the old feudal maxim. Where no other lord can be discovered the crown is lord as lord paramount. The principal incidents of a seignory were fealty and rent-service. In return for these privileges the lord was liable to forfeit his rights if he neglected to protect and defend the tenant or did anything injurious to the feudal relation. Every seignory now existing must have been created before the Statute of *Quia Emptores*, which forbade the future creation of estates in fee-simple by subinfeudation (see REAL ESTATE). The only seignories of any importance at present are the lordships of manors. They are regarded as incorporeal hereditaments, and are either appendant or in gross. A seignory appendant passes with the grant of the manor; a seignory in gross—that is, a seignory which has been severed from the demesne lands of the manor to which it was originally appendant—must be specially conveyed by deed of grant.

SEINE. This, one of the chief rivers of France (Lat. *Sequana*), rises on the eastern slope of the plateau of Langres, 18 miles to the north-west of Dijon. It keeps the same general direction (north-westwards) throughout its entire course, but has numerous windings: between its

source and its mouth in the English Channel the air distance is only 250 miles, but that actually traversed (through the departments of Côte-d'Or, Aube, Seine-et-Marne, Seine-et-Oise, Seine, Eure, and Seine-Inférieure) is 482. Though shorter than the Loire and inferior in volume to the streams of the Rhone system when these are at their fullest, the Seine derives an exceptional importance from the regularity of its flow. This feature is due to the geological character of its basin, an area of 19,400,000 acres, entirely belonging to France (with the exception of a few communes in Belgium), and formed in three-fourths of its extent of permeable strata, which absorb the atmospheric precipitation to restore it gently to the river by perennial springs. It is believed that the Seine never attains a volume so high as 90,000 cubic feet per second. At Paris its average per second is 9000, and after it has received all its tributaries it ranges between 24,000 and 25,000 cubic feet. At Paris it falls as low as 2650 cubic feet and in exceptional droughts the figure of 1200 has been reached. During the flood of 1876, which lasted fifty-five days, the volume between the quays at Paris rose to 58,600 cubic feet per second.

Rising at a height of 1545 feet above sea-level, at the base of the statue of a nymph erected on the spot by the city of Paris, the Seine is at first such an insignificant streamlet that it is often dry in summer as far as to Chatillon (722 feet). At Bar (531 feet) its waters feed the Haute-Seine Canal, so that there is uninterrupted navigation from this point to the sea (395 miles). At Troyes it has descended to 331 feet. It next passes Méry, and at Marcilly receives the Aube (right), from which point it becomes navigable; here it is deflected in a south-westerly direction by the heights of La Brie, the base of which it skirts past Nogent and Montereau, at the latter point receiving the Yonne, its most important left-hand tributary. It then resumes its general north-westerly direction, receiving the Loing (left) at Moret, then passing Melun (121 feet), being joined at Corbeil by the Essonne (left), and after its junction with the Marne (right), a tributary longer than itself by 31 miles, reaches Paris. From this point to the sea its channel has been so deepened by recent works that vessels of 9 to 10 feet draught can reach the capital. The river then winds through a pleasant champagne country past St Cloud, St Denis, Argenteuil, St Germain, Conflans (where it is joined from the right by the Oise, 56 feet above the sea), Poissy, Mantes, Les Andelys, and Poses, where the tide first begins to be perceptible. It next receives the Eure (left), and passes Pont de l'Arche, Elbeuf, and Rouen, where the sea navigation commences. The river has been dyked to Rouen so as to admit vessels of 20 feet draught, and large areas have thus been reclaimed for cultivation.¹ At every tide there is a "bore" (*barre* or *marcarré*), ranging usually from 8 to 10 feet. Between Rouen and the sea there are numerous windings, as in the neighbourhood of Paris; after Caudebec and Quillebeuf (where the Rille is received from the left) the estuary begins, set with extensive sandbanks, between which flows a narrow navigable channel. At Tancarville (right) is the commencement of a canal to enable river boats for Havre to avoid the sea passage. The river finally falls into the English Channel between Honfleur on the left and Havre on the right. The Marne brings to the Seine the waters of the Ormain, the Ourcq, and the Morin; the Oise those of the Aisne; the Yonne those of the Armançon. The low elevation of the bounding hills has rendered it comparatively easy to connect the Seine and its affluents with adjoining river basins by means of canals. The Oise and Somme are connected by the Picardy or Crozat Canal, which in turn is continued to the Scheldt by means of the St Quentin Canal and the Oise, and to the Sambre by that of Oise and Sambre. Between the Aisne and the Meuse is the Ardennes Canal, and the Aisne and the Marne are united by a canal which passes Rheims. The Marne has similar communication with the Meuse and the Rhine, the Yonne with the Saône (by the Burgundy Canal) and with the Loire (by that of Neversais). The Seine itself is connected with the Loire by the Loing Canal dividing at Montargis into two branches,—those of Orleans and Briare.

SEINE, the department of France which has Paris as its chief town, was formed in 1790 of part of the province of Île-de-France. It lies between 48° 44' and 48° 58' N. lat. and 2° 10' and 2° 34' E. long. and is entirely surrounded by the department of Seine-et-Oise, from which it is separated at certain parts by the Seine, the Marne, and the Bièvre. The area of the department is only 118,306

acres, and of this surface a seventh or a sixth is occupied by Paris; the suburban villages also are close together and very populous. In actual population (2,799,329 in 1881) as well as in density (23·7 persons per acre) it holds the first place. Flowing from south-east to north-west through the department, the Seine forms three links: on the right it receives above Paris the Marne, and below Paris the Rouillon, and on the left hand the Bièvre within the precincts of the city. The left bank of the Seine is in general higher than the right and consists of the Villejuif and Chatillon plateaus separated by the Bièvre; the highest point (568 feet) is above Chatillon and the lowest (105) at the exit of the Seine. Below Paris the river flows between the plain of Gennevilliers and Nanterre (commanded by Mont Valérien) on the left and the plain of St Denis on the right. On the right side, to the east of Paris, are the heights of Avron and Vincennes commanding the course of the Marne. Communication is further facilitated by various canals (see PARIS).

Market gardens occupy about 3700 acres within and without the city, and by means of irrigation and manuring are made to yield from ten to eleven crops per annum (see PARIS). Some districts are specially celebrated,—Montreuil for its peaches, Fontenay-aux-Roses for its strawberries and roses, and other places for flowers and nurseries. The department produced in 1883 326,326 bushels of wheat, 4042 of meslin, 75,003 of rye, 3415 of barley, 337,837 of oats, 1,656,009 of potatoes, 14,650 of pulse, and 15,400 tons of beetroot. Altogether, 60,000 persons are engaged in agriculture. The live stock in 1881 comprised 95,796 horses (70,296 in Paris), 4174 cattle, 280 calves, 8159 sheep, 3626 pigs, and 660 goats. Vineyards, producing 366,748 gallons of wine annually, cover 2460 acres. The principal woods (Boulogne and Vincennes) belong to Paris. It is partly owing to the number of quarries in the district that Paris owes its origin: Chatillon and Montrouge in the south yield freestone, and Bagneux and Clamart in the south and Montreuil and Romainville in the east possess the richest plaster quarries in France. Within the circuit of Paris are certain old quarries now forming the catacombs. Most of the industrial establishments in the department are situated in Paris or at St Denis. Pantin (17,857 inhabitants in 1881) on the Ourcq Canal is the seat of a national factory of tobacco, and also of glass-works, and Aubervilliers (19,437) on the St Denis Canal is the seat of great chemical works. Along the Seine, below Paris, Boulogne (25,615) is partly occupied by laundry establishments; Puteaux (15,586) manufactures woollen goods, and has dye-works, printing works, cloth-dressing works, and engineering works of considerable importance; Clichy (24,320) manufactures crystal and has a large gaswork, &c. Above Paris, Ivry (18,442) has iron-works and engineering works; Choisy-le-Roi (6978) has factories for the making of porcelain, glass, soda, chemicals, morocco, and waxcloth; Montreuil (18,693), near Vincennes, makes patent leather, porcelain, &c. The department is of course traversed by all the railway lines which converge in Paris, and also contains the inner circuit railway and part of the outer circuit,—making a total of 122 miles of railway, to which are to be added numerous tramways, 72 miles of national roads, and 458 of other roads. There are 3 arrondissements (Paris, St Denis, and Sceaux), 28 cantons (20 in Paris), and 72 communes. The department forms the archiepiscopal diocese of Paris, falls within the jurisdiction of the Paris court of appeal, and is divided between the four *corps d'armée* of Amiens, Rouen, Le Mans, and Orleans. Among the important institutions in the department are the lycées of Vanves and Sceaux, the lunatic asylum at Charenton, the veterinary college of Maisons-Alfort, and the great Bicêtre hospital at Gentilly.

SEINE-ET-MARNE, a department of northern France, was formed in 1790 of almost the entire district of Brie (half of which belonged to Champagne and half to Île-de-France) and a portion of Gâtinais (from Île-de-France and Orléanais). Lying between 48° 7' and 49° 6' N. lat. and 2° 23' and 3° 13' E. long., it is bounded N. by the departments of Oise and Aisne, E. by Marne and Aube, S. by Yonne and Loiret, and W. by Seine-et-Oise. The whole department belongs to the basin of the Seine, and is drained partly by that river and partly by its tributaries the Yonne and the Loing from the left, and from the right the Voulzie, the Yères, and the Marne, with its affluents the Ourcq, the Petit Morin, and the Grand Morin. With the exception of the Loing, flowing from south to north, all these streams cross the department from east to west,

¹ Comp. RIVER ENGINEERING, vol. xx. p. 579; see also the valuable paper "The River Seine," in *Proc. Inst. Civ. Eng.*, vol. lxxiv., 1886, by L. F. Vernon-Harcourt.

following the general slope of the surface, which is broken up into several plateaus from 300 to 500 feet in height (highest point, in the north-east, 705 feet, lowest 105), and separated from each other by deep valleys. Most of the plateaus belong to the Brie, a fertile and well-wooded district of a clayey character. In the south-west lies the dry sandy district of the Fontainebleau sandstones. The climate is rather more "continental" than that of Paris, —the summers warmer, the winters colder; the annual rainfall does not exceed 16 inches. There is a striking difference between the south of the department, where the famous white grape (*chasselas*) of Fontainebleau ripens, and the country to the north of the Marne,—this river marking pretty exactly the northern limit of the vine.

With a total area of 1,417,534 acres, Seine-et-Marne had in 1879 261,074 under wheat, 274,808 under oats, 53,362 under beetroot, 51,180 under vines. Besides these, meslin, rye, barley, pulse, potatoes are the principal crops grown. In 1884 the yield was 6,567,547 bushels of wheat, 231,959 of meslin, 665,505 of rye, 471,251 of barley, 9,104,254 of oats, 3,035,167 of potatoes, 924,210 tons of beetroot, and 401,427 tons of green fodder (lucerne, clover, sainfoin, &c.). The live stock in 1879 included 40,400 horses, 5190 asses, 522,700 sheep (173,290 superior breed), 101,100 cattle, 16,840 pigs, 3714 goats, and 11,440 beehives (75 tons of honey, 15 of wax). Cereals occupy two-fifths of the department and yield an annual value of £2,400,000, while all other products of the soil do not reach £1,600,000. The wheat and oats of Brie are especially esteemed, as are also the white grapes of Fontainebleau and the roses of Provins (see vol. xix. p. 886). Thousands of the well-known Brie cheeses are manufactured, and large numbers of calves and poultry are reared. The forests (covering a fifth of the surface) are planted with oak, beech, chestnut, hornbeam, birch, wild cherry, linden, willow, poplar, and conifers. Best known and most important is the forest of Fontainebleau, the annual product of which is worth £14,000. Excellent freestone is quarried in the department, especially in the valley of the Loing, mill-stones at La Ferté-sous-Jourarre; the Fontainebleau sandstone, used extensively for pavements, gives employment to 300 establishments, and the white sand which is found along with it is in great request for the manufacture of glass. Along the Marne are numerous plaster-quarries; lime-kilns occur throughout the department; and peat is found in the valleys of the Ourcq and the Voulzie. Beds of common clay and porcelain clay supply the potteries of Fontainebleau, and especially those of Montereau, where upwards of 700 hands are employed. Other industrial establishments are the numerous large flour-mills, the sugar-factories, beetroot distilleries, paper-mills (the Marais paper-mill manufactures bank-notes, &c., both for France and foreign markets), saw-mills, foundries, printing works, tanneries, tawing works, glove factories, chemical works, &c. Most of the motive-power used in these establishments is supplied by the streams. The Seine, the Yonne, the Marne, and the Grand Morin are navigable, and, with the canals of the Loing and the Ourcq and those of Chalifert, Cornillon, and Chelles, which cut off the windings of the Marne, form a total waterway of 219 miles. There are 242 miles of railway. With its 348,991 inhabitants in 1881, Seine-et-Marne is in density of population slightly below the average of France. It has 5 arrondissements, 29 cantons, 530 communes, forms the diocese of Meaux, belongs to the jurisdiction of the Paris court of appeal, and to the district of the Orleans *corps d'armée*. Among the places of note in the department, Montereau (7107 inhabitants in 1881), distinguished as Montereau-faut-Yonne because of its situation at the confluence of the Yonne with the Seine, deserves to be mentioned not only for its porcelain manufacture but also as a great railway station on the route from Paris to Lyons at the junction of the Troyes line, as the scene of the assassination of John the Bold, duke of Burgundy, and as one of the battlefields of Napoleon I. in the campaign of 1814. Its church is an historical monument of the 13th, 14th, 15th, and 16th centuries. A statue of Napoleon stands between the two bridges.

SEINE-ET-OISE, a department of northern France, formed in 1790 of part of the old province of Île-de-France, and traversed from south-east to north-west by the Seine, which is joined by the Oise from the right. Lying between 48° 17' and 49° 14' N. lat. and 1° 27' and 2° 37' E. long., it is surrounded by the departments of Seine-et-Marne on the east, Loiret on the south, Eure-et-Loir on the west, Eure on the north-west, and Oise on the north. It encloses the department of Seine. The Epte on the north-west is almost the only natural boundary of the department. The streams (all belonging to the basin of

the Seine) are, on the right the Yères, the Marne, the Oise, and the Epte, and on the left the Essonne (joined by the Juine, which passes by Étampes), the Orge, the Bièvre, and the Mauldre. Seine-et-Oise belongs in part to the tableland of Beauce in the south and to that of Brie in the east. In the centre are the high wooded hills which make the charm of Versailles, Marly, and St Germain. But it is in the north-west, in the Vexin, that the culminating point of 690 feet is reached, while the lowest point, where the Seine leaves the department, is hardly 40 feet above the sea. The mean temperature is 51° Fahr.

Of the 1,384,695 acres 912,205 are arable soil, 50,330 meadows, 42,852 vineyards, and 199,864 woods. In 1881 the live stock comprised 48,540 horses, 5626 asses, 162 mules, 70,600 cattle, 341,600 sheep (wool-clip, 1110 tons), 16,200 pigs, 4500 goats, and 13,500 beehives. Seine-et-Oise is a great agricultural and horticultural department. The crops in 1883 were—wheat, 5,817,858 bushels; meslin, 353,127; rye, 1,034,572; barley, 641,894; oats, 8,705,193; buckwheat, 3800; potatoes, 6,479,000; beetroot for sugar 206,645 tons, and for fodder 237,915; colza seed, 415 tons; hay, 48,242; clover, 13,505; lucerne, 140,354; sainfoin, 57,283. Oaks, hornbeams, birch, chestnuts are the prevailing trees in the forests, most of which belong to the state. Building, paving, and mill stones (1978 workmen), lime, plaster, marl, chalk, sand, clay, and peat (along the Essonne) are all found in the department. At Enghien are cold mineral springs, and Forges has a hydropathic establishment, where the town of Paris maintains a hospital for scrofulous children. The most important industrial establishments are the national porcelain factory at Sèvres; the Government powder-mills of Sevran and Bouchet; the paper-mills and cardboard mills (1570 workmen) of Corbeil (population 6566 in 1881), Étampes (7465), and Pontoise (6675), but by far the largest is at Essonne (4999); the flax-spinning mills (6368 spindles), cotton-mills (17,830 spindles), silk-mills (5726), wool-mills (8890); the foundries and boat and bridge building yards at Argenteuil (10,167); the engineering and railway works at Corbeil, &c.; the agricultural implement factories at Dourdan (2819); the sugar-refineries with thousands of workmen; distilleries on most of the large farms; starch-works, laundries, large printing establishments close to Paris; factories for chemical products, candles, embroidery, hosiery, perfumery, shoes, and buttons; one of the finest zinc-works in France; saw-mills, &c. Besides the navigation of the Seine, the Marne, the Oise, and the Canal d'Ourcq, the department has 420 miles of railroad, 457 of national roads, and 3958 of other roads. The population of the department in 1881 was 577,798 inhabitants (one and a half times the average density of the French departments). There are 6 arrondissements, 37 cantons, and 686 communes; the department forms the diocese of Versailles, is divided between the *corps d'armée* of Amiens, Rouen, Le Mans, and Orleans, and has its court of appeal at Paris. The commune of Argenteuil (11,849 inhabitants) is not only important for its manufactures but also for its market gardens (asparagus, figs, grapes, &c.); and its church, rebuilt in the 19th century in the Romanesque style, is a fashionable place of pilgrimage.

SEINE INFÉRIEURE, a department of the north of France, formed in 1790 of four districts (Norman Vexin, Bray, Caux, and Roumois) belonging to the province of Normandy. Lying between 49° 15' and 50° 4' N. lat. and 1° 52' and 0° 4' E. long., it is bounded N.W. and N. by the English Channel for a distance of 80 miles, N.E. by Somme, from which it is separated by the Bresle, E. by Oise, S. by Eure and the estuary of the Seine, which separates the department from Calvados. It is divided almost equally between the basin of the Seine in the south and the basins of certain coast streams in the north. The Seine receives from the right hand before it reaches the department the Epte and the Andelle from the Bray district, and then the Darnétal, the Cailly, the Austreberte, the Bolbec, and the Lézarde. The main coast streams are the Bresle (which forms the ports of Eu and Tréport), the Yères, the Arques or Dieppe stream (formed by the junction of the Varennes, the Béthune, and the Eaulne), the Scie, the Saane, the Durdent. As a whole the department may be described as an elevated plateau culminating towards the east in a point 807 feet above the sea and terminating along the Seine in high bluffs and towards the sea in steep chalk cliffs 300 to 400 feet high, which are continually being eaten away and transformed into beds of shingle. There is no striking line of parting between the basins of

the Seine and the Channel, but deep valleys have been hollowed out by the streams. The Bray district in the south-east is a broad valley of denudation formed by the sea as it retired, and it is traversed by smaller valleys and covered with excellent pasture. In the comparatively regular outline of the coast there are a few breaks, as at Tréport, Dieppe, St Valéry-en-Caux, Fécamp, and Havre, the Cap de la Hève, which commands this last port, and Cape Antifer, 12 or 13 miles farther north. Tréport, Dieppe, Veules, St Valéry, Fécamp, Yport, Etretat, and Ste Adresse (to mention only the more important) are fashionable watering-places with the Parisians. The winters are not quite so cold nor is the summer so hot as in Paris, and the average temperature of the year is higher. The rainfall is 24 inches per annum, increasing from Rouen to Dieppe as the sea is approached.

With a total area of 1,491,458 acres, Seine Inférieure has 911,938 acres of arable ground, 151,125 of wood, 99,703 grass, 32,977 moorland and pasturage. Out of a total population of 814,068 in 1881 those dependent on agriculture numbered 233,536. The live stock in the same year comprised 81,561 horses of good breeds, 1421 asses, 125 mules, 236,493 cattle, 259,677 sheep of ordinary kinds and 27,523 of special breeds (wool-clip, 560 tons), 78,186 pigs, 3341 goats, 13,202 beehives (54 tons of honey and 13 of wax). Milch cows are kept in great numbers, and Gournay butter and Gournay and Neufchâtel cheese are in repute. The farms of the Caux plateau are each surrounded by an earthen dyke, on which are planted forest trees, generally beech and oak. Within the shelter thus provided apple and pear trees grow, which produce the cider generally drunk by the inhabitants (38,602,036 gallons in 1883). The other crops in 1883 were—wheat, 6,667,650 bushels; meslin, 59,950; rye, 654,489; barley, 443,751; oats, 7,017,609; potatoes, 2,954,457; pulse, 98,736; beetroot for sugar 28,837 tons, and for fodder 118,099; colza seed, 29,076 tons; and 457,047 tons of ordinary fodder. In general the department is fertile and well cultivated. Along the Seine fine meadow-land has been reclaimed by dyking; and sandy and barren districts have been planted with trees, mostly with oaks and beeches, and they often attain magnificent dimensions, especially in the forest of Arques and along the railway from Rouen to Dieppe; *Pinus sylvestris* is the principal component of the forest of Rouvray opposite Rouen. With the exception of a little peat and a number of quarries, employing 745 workmen, Seine Inférieure has no mineral source of wealth; but manufacturing industry is well developed. Rouen is the chief centre of the cotton-trade, which is in the department represented by 190 spinning and weaving factories, employing 22,947 hands, 1,400,000 spindles, 14,000 power-looms, and 4000 hand-looms, and working up 30,000 tons of cotton annually. Hand-loom weaving, carried on throughout the country districts, employs 18,000 looms; in the branch of the cotton trade known as *rouennerie* 190 manufacturers are employed, producing to the value of £2,400,000 per annum; in that of the *indiennes* 20 establishments with 5000 workpeople turn out yearly 1,000,000 pieces of 115 yards each. There are 22 establishments for dyeing cotton cloth with 700 workmen, and for dyeing cotton yarn 32 establishments with 1200 workmen. The woollen manufacture, of which Elbeuf is the centre, employs 24,000 workmen and produces goods valued at about £3,500,000, with raw material valued at £1,720,000, mainly imported from Australia and partly from the La Plata ports. The wool-spinning mills (at Elbeuf and Darnétal) have 92,000 spindles, and there are 650 power-looms and 3800 hand-looms. At Elbeuf (22,883 inhabitants in 1881) there are 17 dyeworks, 50 twist factories, a manufactory of carding machines, and 45 cloth-dressing factories. About 18,000 spindles are employed in flax-spinning, an industry more widely distributed throughout the department. Engineering works, foundries, and iron shipbuilding yards occur at Havre (population 105,540 in 1881) and Rouen (105,860). Wooden ships are also built at Havre, Rouen, Dieppe (21,585), and Fécamp (11,919). Other establishments of importance are the national tobacco-factories at Dieppe (1100 hands) and Havre (580 hands), sugar-refineries (£1,440,000 worth of sugar in 1881), glass-works (873 workmen), soap-works, chemical works, candle-factories, flour-mills, oil-factories, ivory-works, lace-works, clock-factories, &c. The total number of industrial establishments in the department is 975; and it is estimated that 305,460 persons depend on industrial pursuits. The fisheries are a great resource for the inhabitants of the seaboard. Fécamp sends yearly £100,000 worth of cod and £80,000 worth of herrings, mackerel, &c., into the market; Dieppe has the supplying of Paris with fresh fish; St Valéry sends its boats as far as Iceland. The principal ports for foreign trade are Havre, Rouen, and Dieppe. There are 364 miles of railway, 370 of national roads, 6543 of other roads, 98 of Seine navigation, and the Bresle is canalized for 2 miles. In population Seine Inférieure stands fourth in the list of French departments;

it has consequently been proposed to divide it into the two departments of Seine Inférieure and Seine Maritime. The density of population is double the average of France. There are 5 arrondissements, 51 cantons (of which 3 are in Havre and 6 in Rouen), and 759 communes. The department forms the archbishopric of Rouen; the court of appeal and the headquarters of the *corps d'armée* are also in that city. Places of importance are Elbeuf; Fécamp, a fishing port, with sea-bathing, distilling, &c.; Bolbec (10,226 inhabitants), with weaving and spinning factories; and Eu (4827 inhabitants), with a celebrated castle belonging to Louis Philippe and the Orleans family.

SEISIN. "Seisin of the freehold may be defined to be the possession of such an estate in land as was anciently thought worthy to be held by a free man" (Williams, *On Seisin*, p. 2). Seisin is now confined to possession of the freehold, though at one time it appears to have been used for simple possession without regard to the estate of the possessor. (See POSSESSION.) Its importance is considerably less than it was at one time owing to the old form of conveyance by feoffment with livery of seisin having been superseded by a deed of grant (see REAL ESTATE), and the old rule of descent from the person last seised having been abolished in favour of descent from the purchaser. (See INHERITANCE.) At one time the right of the wife to dower and of the husband to an estate by curtesy depended upon the doctrine of seisin. The Dower Act, 3 and 4 Will. IV. c. 105, has, however, rendered the fact of the seisin of the husband of no importance, and the Married Women's Property Act, 1882, appears to have practically abolished the old law of curtesy. In the case of a conveyance operating under the Statute of Uses, seisin is deemed to be given by the effect of the statute. This constructive seisin may still be of importance where the question arises how long a person has been in actual possession. Thus in *Orme's Case* (Law Rep., 8 Common Pleas, 281) the right to a county vote depended upon the form of the conveyance of a rent-charge to the voter. If the conveyance had been under the statute, the claimant would have been seised for a sufficient time; the court, however, held that the conveyance was a common law grant, and that the grantee must have been in actual receipt of the rent in order to entitle him to be registered.

Primer seisin was a feudal burden at one time incident to the king's tenants *in capite*, whether by knight service or in socage. It was the right of the crown to receive of the heir, after the death of a tenant *in capite*, one year's profits of lands in possession and half a year's profits of lands in reversion. The right was abandoned by the Act abolishing feudal tenures (12 Car. II. c. 24).

In Scotch law the corresponding term is "sasine." Like seisin in England, sasine has become of little legal importance owing to recent legislation. By 8 and 9 Vict. c. 35 actual sasine on the lands was made unnecessary. By 21 and 22 Vict. c. 76 the instrument of sasine was superseded by the recording of the conveyance with a warrant of registration thereon. For the register of sasines, see REGISTRATION.

SEISMOMETER. This name was originally given to instruments designed to measure the movement of the ground during earthquakes. Recent observations have shown that, in addition to the comparatively great and sudden displacements which occur in earthquakes, the ground is subject to other movements. Some of these, which may be called "earth-tremors," resemble earthquakes in the rapidity with which they occur, but differ from earthquakes in being imperceptible (owing to the smallness of the motion) until instrumental means are used to detect them. Others, which may be called "earth-tiltings," show themselves by a slow bending and unbending of the surface, so that a post stuck in the ground, vertical to begin with, does not remain vertical, but inclines now to one side and now to another, the plane of the ground in which it stands shifting relatively to the horizon. No sharp distinction can be drawn between these classes

of movements. Earthquakes and earth-tremors grade into one another, and in almost every earthquake there is some tilting of the surface. The term "seismometer" may conveniently be extended (and will here be understood) to cover all instruments which are designed to measure movements of the ground.

Measurements of earth-movements are of two distinct types. In one type, which is applicable to ordinary earthquakes and earth-tremors, the thing measured is the displacement of a point in the earth's crust. In the second type, which is applicable to slow tiltings, the thing measured is any change in the plane of the earth's surface relatively to the vertical. Under EARTHQUAKE mention is made of instruments designed by Palmieri and others to register the occurrence of earthquakes, and in some cases to give a general idea of their severity. While some of those instruments act well as seismoscopes, none of them serve to determine with precision the character or the magnitude of the motion. In this article notice will be taken only of instruments intended for exact measurement.

Earthquake displacements are in general vertical as well as horizontal. For the purpose of measurement it is convenient to treat the vertical component separately, and in some cases to resolve the horizontal motion into two components at right angles to each other.

Inertia Method.—In the first type of measurements what may be called the "inertia" method is followed. A mass is suspended with freedom to move in the direction of that component of the earth's motion which is to be measured. When an impulse occurs the supports move, but the mass is prevented by its inertia from accompanying them. It supplies a steady point, to be used as a standard of reference in determining the extent through which the ground has moved in the direction in question. But, in order that the suspended mass shall not acquire motion when its supports move, one essential condition must be satisfied. Its equilibrium must be neutral, or nearly so, in order that, when the supports are displaced, little or no force may be brought into operation tending to bring the mass into the same position relative to the supports as it occupied before disturbance. This can be made plain by considering the case of a common pendulum hung from a support which is rigidly fixed to the ground. When the ground moves in any horizontal direction the pendulum's inertia causes a certain point in it (the centre of percussion) to remain for the instant at rest. But this contrivance does not yield a steady point, because the stability of the pendulum makes the bob swing down to recover its place directly under the support; and in fact, if a succession of oscillations of the ground occur, the bob acquires a motion often much greater than the motion of the support itself. This tendency may be corrected, and the pendulum made fit to act as a seismometer, by any contrivance which (without introducing friction) will reduce its stability so much as to make the equilibrium of the bob very nearly neutral. In all instruments designed to furnish a steady point the suspended mass must have some small stability,

FIG. 1.—Duplex pendulum seismograph.

else it would be unmanageable; but its period of free oscillation must be much greater than that of the earthquake-motions which it is employed to measure. Even a simple pendulum can have its stability reduced sufficiently to fit it for seismometric work by making it very long. The same result is, however, much more conveniently achieved by combining a common pendulum with an inverted pendulum placed just beneath it. The common pendulum being stable and the inverted pendulum unstable, if the bobs are joined so that they must move together, the combination can be made as nearly astatic as may be desired.¹ Figs. 1 and 2 illustrate how this combination is applied in seismometry.

The stable bob *a*, hung from a fixed support above by three parallel wires, is connected with the inverted pendulum *b* by a ball-and-tube joint. A lever *c*, carried by a gimbal joint in the fixed bracket *d*, is geared also by a ball-and-tube joint to the upper bob. Its long arm carries a jointed index *e*, which projects out and touches a smoked-glass plate *f*, held on a fixed shelf. Any horizontal motion of the ground acts on the lever by the bracket *d*, and causes the index to trace a magnified record on the smoked-glass plate. Fig. 1 is taken from a photograph of an instrument of this kind, constructed to give a much magnified record of small movements. When large earthquakes are to be recorded the multiplying lever is dispensed with, and the index is attached directly to one of the bobs. Observations with instruments of this class exhibit well the very complicated motion which the earth's surface undergoes during an earthquake. In small earthquakes (such as are only slightly or not at all destructive) the greatest amplitude of motion is often less than a millimetre, and rarely more than a centimetre; the disturbance nevertheless consists of a multitude of successive movements, quite irregular in amplitude, period, and direction. Fig. 3 is a facsimile of the record given by a duplex pendulum seismograph during one of the earthquakes which occur frequently in the plain of Yedo, Japan. The record, as engraved, is three and a half times the earth's actual motion. Instead of two pendulums, a single inverted pendulum has been used, with a spring stretched between it and a fixed support above. By adjusting the spring so that a proper proportion of the weight is borne by it and the remainder by the rigid stem of the pendulum, an approach to neutral equilibrium can be made.² In Forbes's inverted pendulum seismometer³ a somewhat similar plan was adopted: the foot of the pendulum was attached to an elastic wire which tended to restore it to its normal vertical position when displaced.

FIG. 2.—Duplex pendulum showing details.

Another group of instruments designed to furnish two degrees of freedom for the purpose of recording all motions in a horizontal plane, but much less satisfactory on account of their friction, is that in which a rolling sphere either itself supplies inertia or forms a support for a second inertia-giving mass. Probably the earliest was one used in Japan by Dr G. F. Verbeek in 1876 (see fig. 4). On a marble table, ground plane and carefully levelled, four balls of rock-crystal were placed, carrying a massive block of hard wood. A pencil, sliding in a hole in the block, registered the relative motion of the table and the block on a sheet of paper fixed below. The motion registered is (or would be, if there were no friction) somewhat larger than the true motion of the table, for the system is kinetically equivalent to four upright pieces whose centres of percussion lie in a plane nearly, but not quite, as high as the tops of the balls. This forms what may be called the steady plane; its position depends on the relative masses of block and balls, and is easily calculated. When the ground moves in any direction the block moves through a short distance in the opposite direction, and the record is magnified in a fixed ratio. Various forms of rolling-sphere seismometers have been

proposed by Mr. T. Gray,¹ Mr. C. A. Stevenson,² and others. Probably the best form would be that of a light spherical segment rolling on a level plane base and carrying a heavy bob fixed to it. To give some stability the bob should be placed so as to bring the centre of gravity a little under the centre of curvature. The centre of percussion, somewhat higher than this, would of course be the steady point, and a multiplying pointer might take the motion either from it or from any other convenient part of the rolling piece. All rolling seismometers—including rolling cylinders, which have been proposed by Mr Gray as single-freedom instruments, to register one component of horizontal motion—fail to act well, partly because of the comparatively great frictional or quasi-frictional resistance which is presented to the motion of the free mass, and partly because, owing to imperfections in the construction and want of perfect rigidity in the materials, the ball or cylinder takes up a position in which there is an objectionably great stability as regards very small displacements. These objections make the use of rolling seismometers unadvisable, except perhaps for the rough measurement of violent earthquakes.

The seismographs which have been described draw a horizontal plan of the path pursued during an earthquake by a point on the earth's surface. They take no note of the relation of the displacement to time,—an element which is required if we are to form any estimate of the violence of an earthquake from the record. With this view a different method of registration is also followed. The whole movement is resolved into rectilinear components, and these are separately recorded (by single-freedom seismometers) on a plate or drum which is kept in continuous movement, so that the record of each component takes the form of an undulating line, from which the number, succession, amplitude, velocity, and acceleration of the component movements can be deduced and the resultant motion determined. A single steady mass with two degrees of freedom may still be employed to record, separately, two components of horizontal motion; but it is generally preferable to provide two distinct masses, each with one degree of freedom. The principal instrument of this class is the horizontal pendulum seismograph,³ which has been used to record Japanese earthquakes since 1880. It consists of two horizontal pendulums, set at right angles to each other, each supplying a steady point with respect to horizontal motions transverse to its own length. Each pendulum is pivoted about two points, on an axis which is nearly vertical, but inclined slightly forwards to give a suitable degree of stability. In some forms of the instrument the pivoted frame of the pendulum is light, and the inertia is practically all furnished by a second piece or bob pivoted on the frame about a vertical axis through the centre of percussion of the frame. This construction has the advantage of compactness and of making the position of the steady point at once determinate. But a simpler construction is to attach the bob rigidly to the frame. This shifts the steady point a little way outwards from the position it would have if the bob were pivoted. In either construction a prolongation of the pendulum beyond the bob forms a convenient multiplying index. Fig.

Fig. 5.—Horizontal pendulum seismograph.

5 shows a complete horizontal pendulum seismograph (with pivoted bobs). Two rectangular components of earthquake motion are recorded radially on a revolving plate of smoked glass, which receives its motion through a friction roller from a clock furnished with a fluid-friction centrifugal governor. The clock may either be kept going continuously, in expectation of an earthquake at any moment,

or be started into motion by an electric seismoscope when the earliest indications of an earthquake are felt. The former plan is practicable only when the instrument can receive careful attendance and where earthquakes occur often. It has the drawback that the circle which is drawn by each pointer as the plate revolves below it gradually broadens, partly because of warping and temperature changes in the supports and partly because of actual tilting of the ground. As an earthquake generally begins with comparatively insignificant movements, there is not much to object to in having the plate at rest to begin with, provided a sufficiently sensitive starting seismoscope be used. A suitable arrangement for this purpose is one due to Palmieri: a short pendulum hangs over a cup of mercury, in the centre of which a depression is formed by an iron pin, whose top is a little lower than the surface of the mercury. The pendulum ends in a platinum point, which stands clear in the centre of this depression, but touches the edge whenever a horizontal movement of the ground takes place, thereby closing the circuit of an electro-magnet, which starts the clock. In the most recent form of the horizontal pendulum seismograph the bobs are fixed to the pivoted frames, and the pointers are arranged to trace their records side by side. Records with instruments of this class, besides giving much additional information, agree with those of the duplex pendulum in showing that earthquake motion is a tangle of waves in all azimuths. This will be seen by reference to fig. 6, which shows a small portion of an earthquake registered by a pair of horizontal pendu-

Fig. 6.—Record of earthquake by horizontal pendulum seismograph; one-third full size.

lums. Contemporary parts of the two records are shown together, the straight radial lines marking seconds of time. The phases of the two components are continually changing, and when the two are compounded the result is a path having the same characteristics as those of the diagram in fig. 3. Fig. 7 gives the result of compounding⁴ the records of fig. 6 during three seconds, while the range of movement was a maximum.

Fig. 7.—Result of compounding the record of fig. 6.

To register the vertical component of earthquake motions we require to suspend a mass with vertical freedom. Most ways of doing this give too much stability, as, for instance, when a weight is hung from a spiral spring or carried by a horizontal bar that is fixed to a wall or table by a flexible spring joint. This last is the vertical motion seismometer which was used by the British Association Committee at Comrie in 1842. Another form, mechanically equivalent to this, is a weighted horizontal bar, pivoted on a fixed horizontal fulcrum, and held up by a spiral spring, stretched from a point near the fulcrum to a fixed support above. This mode of suspension is still too stable, though less so than if the spring were directly loaded. To make it nearly astatic Mr T. Gray⁴ proposed the use

Fig. 8.—Principle of vertical motion seismograph.

of a tube containing mercury, connected with the bar in such a manner that when the bar goes down the mercury, running towards one end of the tube, has the effect of increasing the weight, and when the bar goes up an opposite effect occurs. This plan is open to the objection that the mercury is disturbed by horizontal movements of the ground. A simpler plan is shown in fig. 8.⁵ There the pull of the spring is applied at a short distance v below the plane of the bar. Hence when the weight goes down the spring,

⁴ Gray, *Trans. Seis. Soc. Jap.*, vol. iii. p. 187.

⁵ Ewing, *Trans. Seis. Soc. Jap.*, vol. iii. p. 140.

which then pulls with more force, pulls with a smaller leverage, and it is easy to adjust the distance v so that the moment of the pull of the spring remains sensibly equal to the moment of the weight,—the condition necessary to make the bar astatic. This is secured when $v = \frac{h^2}{l}$, h being the horizontal distance from the ful-

crum to the point at which the spring acts, and l the length by which the spring is stretched when the bar is undeflected. Stability is given by making v somewhat less than this. A vertical-motion seismograph, constructed on the principle which fig. 8 illustrates diagrammatically, is arranged to trace its record on a revolving glass plate. This, along with a pair of horizontal pendulums recording on the same plate, completes a three-component seismograph.

An interesting mode of suspension, by which a mass is hung in neutral or nearly neutral equilibrium, with one degree of horizontal freedom, is shown in fig. 9. It is based on the approximate straight line linkwork of Tchebicheff. When a bar is hung from fixed supports by crossed ties, at a distance below the supports equal to the distance between the supports, the length of the bar being equal to half that distance, its middle point moves in very nearly a straight line. By fixing a weight at the centre of the bar and adding a suitable recording apparatus, we have a very frictionless form of one-component horizontal seismometer.¹ When a displacement of the ground occurs in the line of the bar, the bar is tilted through an angle which is proportional to the linear displacement, and the centre of the bar consequently shares, in a small and definite proportion, the motion of the ground,—a fact which is to be borne in mind in estimating the degree of multiplication given by the recording apparatus.

Fig. 9.—Astatic suspension.

The instruments which have been described afford complete and satisfactory means of determining the motion which a point of the ground undergoes during any disturbance which would be recognized as an earthquake. For minute earth-tremors, however, a larger multiplication is necessary, and the absence of friction is of even more importance than in the measurement of earthquakes proper. Optical methods of magnifying the motion are accordingly resorted to. In the "normal tromometer" of Bertelli, used in Italy to detect earth-tremors, the bob of a pendulum, suspended by a fine wire from a fixed support, is viewed through a reflecting prism and its motion in any azimuth measured by a micrometer microscope. The great stability of the pendulum, which is only $1\frac{1}{2}$ metres long, prevents it from behaving as a steady-point seismometer; and, if successive earth-movements were by chance to occur with a period equal or nearly equal to its own free period, its acquired swing would altogether mask the legitimate indications. This kind of action has, in fact, been turned to account as a means of detecting very minute earth-tremors by Rossi, who has devised a micro-seismoscope, consisting of a number of pendulums of various lengths, one or other of which is likely to be set swinging when the ground shakes to and fro repeatedly, through even the minutest range. To measure tremors, however, the instruments of Bertelli and Rossi are inappropriate; for that purpose, just as for the purpose of measuring larger motions, the suspended mass must be in nearly neutral equilibrium. To find a mode of suspension which is at once astatic and extremely frictionless is a matter of some difficulty; the crossed-link suspension, which has been already described, is probably the most satisfactory means hitherto suggested. It has been adopted in the micro-seismometer sketched in section in fig. 10.

Fig. 10.—Microseismometer.

Two bobs are separately suspended, in the manner shown by fig. 9, at right angles to each other, one above the other, in a cast-iron case. A microscope, fixed to the top of the case and furnished with a micrometer eye-piece, is focused on a hair, which

is stretched transversely across a vertical tube in the upper bob a . This serves to measure horizontal motion in the plane of the drawing. Motion at right angles to this is shown by the lower bob c (drawn in section), which carries a similar transverse hair. A fixed lens b between the bobs gives an image of the lower hair in the plane of the upper hair, so that both appear crossed in the field of the microscope, thereby allowing both components of horizontal motion to be observed together.

Equilibrium Method.—In observing slow earth-tiltings an entirely different process is followed. The problem then is, not to measure displacements by aid of the inertia of a body which tends to preserve its original position, but to compare the direction of a line or plane fixed to the earth with the direction of the vertical. The earliest observations of earth-tiltings were made by the aid of spirit-levels. If a level be set on a table fixed to the rock, its bubble, watched through a microscope, will be seen to move slowly now to one side and now to another. The movements are so slow that the inertia of the fluid is unimportant. Observations with pairs of levels, set at right angles to each other, have been carried on systematically for some years by M. P. Plantamour.² This is the simplest method of measuring earth-tiltings, but it is liable to errors which are not easily excluded. Another method of investigating changes in the direction of the vertical was initiated in 1868 by M. A. d'Abbadie,³ who had before that observed the movements of level-bubbles. Light from a fixed source is made to fall on a reflecting basin of mercury about 10 metres below it. Above the basin is a large lens of long focus, which brings the rays into parallelism during their passage to the mercury, and causes them to converge after reflexion, so that an image of the source is formed at a convenient distance from it, and in the same horizontal plane. The interval between the source and the image is measured (in amount and azimuth) at least twice a day by a micrometer microscope. The accuracy of the method depends on the fixity of the source of light relatively to the lens and to the surface of the ground, and to secure this M. d'Abbadie built a massive hollow cone of concrete for the support of his apparatus. His observations have shown that the earth's surface undergoes almost incessant slow tilting through angles which, in the course of a year, have been found to range over four seconds. He has also noticed the occurrence of earth-tremors by the occasional blurring of the image through agitation of the mercury. An improvement on his apparatus suggested by M. Wolf⁴ is shown in fig. 11.

Fig. 11.

The light, instead of being all reflected from the free surface of mercury (a), is partly reflected from that and partly from a plane mirror (b) fixed to the rock. Two images are therefore formed, whose relative position measures the tilting of the surface. The advantage of this is that the position of the source of light need no longer be fixed, and the accuracy of the method depends only on the fixity of the mirror b with respect to the rock. Further, to avoid having the source and image at a great height above the surface, M. Wolf allows the light to reach and leave the apparatus horizontally, in the manner indicated in the sketch, by using a plane mirror inclined at 45° to the horizon. Still another mode of investigating slow changes of the vertical was followed (at the suggestion of Sir William Thomson) by Messrs G. H. and H. Darwin, in observations made by them with the view of measuring the lunar disturbance of gravity. The Reports of the British Association for 1881 and 1882 contain a full account of their apparatus, as well as notices of the work of other observers and a discussion of the cause of earth-tiltings. Their instrument was a short pendulum hung in a viscous fluid, from a fixed support, by two wires arranged V-wise to leave the pendulum only one degree of freedom. Below the bob was a small mirror hung by two threads, one of which was attached to the pendulum bob and the other to a fixed support. The pendulum was free to swing at right angles to the plane of the threads, and any movement of this kind caused the mirror to rotate through an angle which was measured in the usual way by a telescope and scale. The method is susceptible of very great delicacy, but Messrs Darwin found that when the instrument was adjusted to be specially sensitive its manipulation became extremely difficult. Wolf's modification of D'Abbadie's method appears to furnish, on the whole, the most promising apparatus for measurements of this type. The apparatus represented in fig. 10 is also applicable. The method of measurement employed in the case of slow tiltings may be called the equilibrium method in contradistinction to the inertia method, which is used to measure comparatively sudden displacements. The

two methods are applicable to two widely different classes of movements. It is at least possible that between these classes there may be other modes of motion,—displacements which are too slow for the inertia method, and which give rise to too little change of slope for the equilibrium method. How to measure them is, and must apparently remain, an unsolved problem in seismometry.

References.—The *Report of the British Association for 1858* contains an account by Mallet of some of the older and now obsolete forms of seismometers (see also *EARTHQUAKE*). For accounts of modern instruments of the inertia class, see the *Transactions of the Seismological Society of Japan* from 1880, also Prof. Ewing's *Memoir on Earthquake Measurement*, published by the university of Tokio (1888). References to papers on the equilibrium method of measurement have been made in the text. (J. A. E.)

SEISTAN. See SISTAN.

SEJANUS, ÆLIUS (executed 31 A.D.), the famous minister of TIBERIUS (q.v.).

SELBY, a market town of the West Riding of Yorkshire, England, is situated on the navigable river Ouse and on the main line of the Great Northern Railway, 15 miles south of York and 20 east of Leeds. Of the ancient abbey for Benedictines, founded by William the Conqueror in 1069 and raised to the dignity of a mitred abbey by Pope Alexander II., there still remains the church of St Mary and St German, although it has been much changed by alterations and additions, the more ancient and notable features being the nave, transept, and west front. The church was made parochial in 1618. In the market-place there is a modern Gothic market cross. Among the public buildings are the drill hall and the mechanics' institute and public rooms. Flax-scutching, seed-crushing, brick and tile making, boat-building, tanning, and brewing are the principal industries. There is a large trade in potatoes, flax, and mustard, and a considerable cattle-market. The town receives its water-supply from artesian wells. A local board of health was established in 1851, consisting of nine members. The population of the urban sanitary district (6193 in 1871), extended in 1881 from 514 to 3760 acres, was in that year 6057.

Henry I. of England was born in the abbey, a fact which probably accounts for the special privileges conferred on it. In the early part of the Civil War it was held by the Parliament, and after being taken by the Royalists was recaptured by Fairfax.

SELDEN, JOHN (1584-1654), jurist, legal antiquary, and Oriental scholar, was born on 16th December 1584 at Salvington, in the parish of West Tarring, near Worthing, Sussex. His father, also named John Selden, held a small farm, and seems to have occasionally added to his livelihood by his labour as a wheelwright and his skill as a musician. It is said that his accomplishments as a violin-player gained him his wife, whose social position was somewhat superior to his own. She was Margaret, the only child of Thomas Baker of Rustington, a village in the vicinity of West Tarring, and was more or less remotely descended from a knightly family of the same name in Kent. John Selden commenced his education at the free grammar-school at Chichester, whence he proceeded in his sixteenth year with an exhibition to Hart Hall at Oxford. In 1603 he was admitted a member of Clifford's Inn, London, and in 1604 migrated to the Inner Temple, and in due course he was called to the bar. While still a student he appears to have been on terms of friendship with Ben Jonson, Drayton, and Camden; and among his more intimate companions were Edward Littleton, afterwards lord keeper; Henry Rolle, afterwards lord chief-justice; Edward Herbert, afterwards solicitor-general; and Thomas Gardener, afterwards recorder of London. His earliest patron was Sir Robert Cotton, the antiquary, by whom he seems to have been employed in copying and abridging certain of the parliamentary records then preserved in the Tower. For some reason which has not been explained, Selden never went into court as an advocate, save on rare and exceptional occasions. But his practice in chambers as a conveyancer and consulting counsel is stated to have been large, and, if we may judge

from the considerable fortune he accumulated, it must also have been lucrative.

It was, however, as a scholar and writer that Selden won his reputation both amongst his contemporaries and with posterity. His first work, an account of the civil administration of England before the Norman Conquest, is said to have been completed when he was only two- or three-and-twenty years of age. But if this was the *Analecton Anglo-Britannicon*, as is generally supposed, he withheld it from the world until 1615. In 1610 appeared his *England's Epinomis* and *Janus Anglorum, Facies Altera*, which dealt with the progress of English law down to Henry II., and *The Duello, or Single Combat*, in which he traced the history of trial by battle in England from the Norman Conquest. In 1613 he supplied a series of notes, enriched by an immense number of quotations and references, to the first eighteen cantos of Drayton's *Polyolbion*. In 1614 he published *Titles of Honour*, which, in spite of some obvious defects and omissions, has remained to the present day the most comprehensive and trustworthy work of its kind that we possess; and in 1616 his notes on Fortescue's *De Laudibus Legum Angliæ* and Hengham's *Summæ Magnæ et Parvæ*. In 1617 his *De Diis Syriis* was issued from the press, and immediately established his fame as an Oriental scholar among the learned in all parts of Europe. After two centuries and a half, indeed, it is still not only the fundamental but also in many respects the best book which has been written on Semitic mythology. In 1618 his *History of Tithes*, although only published after it had been submitted to the censorship and duly licensed, nevertheless aroused the apprehension of the bishops and provoked the intervention of the king. The author was summoned before the privy council and compelled to retract his opinions, or at any rate what were held to be his opinions. Moreover, his work was suppressed and himself forbidden to reply to any of the controversialists who had come or might come forward to answer it.

This seems to have introduced Selden to the practical side of political affairs. The discontents which a few years later broke out into civil war were already forcing themselves on public attention, and it is pretty certain that, although he was not in parliament, he was the instigator and perhaps the draftsman of the memorable protestation on the rights and privileges of the House affirmed by the Commons on the 18th of December 1621. He was with several of the members committed to prison, at first in the Tower and subsequently under the charge of Sir Robert Ducie, sheriff of London. During his detention, which only lasted a short time, he occupied himself in preparing an edition of Eadmer's *History* from a manuscript lent to him by his host or jailor, which he published two years afterwards. In 1623 he was returned to the House of Commons for the borough of Lancaster, and sat with Coke, Noy, and Pym on Sergeant Glanville's election committee. He was also nominated reader of Lyon's Inn, an office which he declined to undertake. For this the benchers of the Inner Temple, by whom he had been appointed, fined him £20 and disqualified him from being chosen one of their number. But he was relieved from this incapacity after a few years, and became a master of the bench. In the first parliament of Charles I. (1625), it appears from the "returns of members" printed in 1878 that, contrary to the assertion of all his biographers, he had no seat. In Charles's second parliament (1626) he was elected for Great Bedwin in Wiltshire, and took a prominent part in the impeachment of George Villiers, duke of Buckingham. In the following year, in the "benevolence" case, he was counsel for Sir Edmund Hampden in the Court of King's Bench. In 1628 he was returned to the third parliament of Charles for Ludgers-

hall in Wiltshire, and had a large and important share in drawing up and carrying the Petition of Right. In the session of 1629 he was one of the members mainly responsible for the tumultuous passage in the House of Commons of the resolution against the illegal levy of tonnage and poundage, and, along with Eliot, Holles, Long, Valentine, Strode, and the rest, he was sent once more to the Tower. There he remained for eight months, deprived for a part of the time of the use of books and writing materials. He was then removed, under less rigorous conditions, to the Marshalsea, until not long afterwards owing to the good offices of Archbishop Laud he was liberated. Some years before he had been appointed steward to the earl of Kent, to whose seat, Wrest in Bedfordshire, he now retired. In 1628 at the suggestion of Sir Robert Cotton he had compiled, with the assistance of two learned coadjutors, Patrick Young and Richard James, a catalogue of the Arundel marbles. He employed his leisure at Wrest in writing *De Successionibus in Bona Defuncti secundum Leges Ebræorum* and *De Successione in Pontificatum Ebræorum*, published in 1631. About this period he seems to have inclined towards the court rather than the popular party, and even to have secured the personal favour of the king. To him in 1635 he dedicated his *Mare Clausum*, and under the royal patronage it was put forth as a kind of state paper. It had been written sixteen or seventeen years before; but James I. had prohibited its publication for political reasons; hence it appeared a quarter of a century after Grotius's *Mare Liberum*, to which it was intended to be a rejoinder, and the pretensions advanced in which on behalf of the Dutch fishermen to poach in the waters off the British coasts it was its purpose to explode. The fact that Selden was not retained in the great case of ship money in 1637 by John Hampden, the cousin of his former client, may be accepted as additional evidence that his zeal in the popular cause was not so warm and unsuspected as it had once been. During the progress of this momentous constitutional conflict, indeed, he seems to have been absorbed in his Oriental researches, publishing *De Jure Naturali et Gentium juxta Disciplinam Ebræorum* in 1640. He was not elected to the Short Parliament of 1640; but to the Long Parliament, summoned in the autumn, he was returned without opposition for the university of Oxford. Immediately after the opening of the session he was nominated a member of the committee of twenty-four appointed to draw up a remonstrance on the state of the nation. He was also a member of the committees entrusted with the preliminary arrangements for the impeachment of Strafford. But he was not one of the managers at the trial, and he voted against the Bill for his attainder. He was, moreover, a member of the committees nominated to search for precedents and frame the articles of impeachment against Archbishop Laud, although it does not appear that he was implicated in the later stages of the prosecution against him. He opposed the resolution against Episcopacy which led to the exclusion of the bishops from the House of Lords, and printed an answer to the arguments used by Sir Harbottle Grimston on that occasion. He joined in the protestation of the Commons for the maintenance of the Protestant religion according to the doctrines of the Church of England, the authority of the crown, and the liberty of the subject. He was equally opposed to the court on the question of the commissions of lieutenancy of array and to the parliament on the question of the militia ordinance. In 1643, however, he became a member and participated in the discussions of the assembly of divines at Westminster, and was appointed shortly afterwards keeper of the rolls and records in the Tower. In 1645 he was named one of the parliamentary commissioners of the admiralty, and was

elected master of Trinity Hall in Cambridge,—an office he declined to accept. In 1646 he subscribed the Solemn League and Covenant, and in 1647 was voted £5000 by the parliament as compensation for his sufferings in the evil days of the monarchy. He had not, however, relaxed his literary exertions during these years. He published in 1642 *Privileges of the Baronage of England when they sit in Parliament and Discourse concerning the Rights and Privileges of the Subject*; in 1644 *Dissertatio de Anno Civili et Calendario Reipublicæ Judaicæ*; in 1646 his treatise on marriage and divorce among the Jews entitled *Uxor Ebraica*; and in 1647 the earliest printed edition of the old and curious English law-book *Fleta*. What course he adopted with regard to the trial and execution of the king is unknown; but it is said that he refused to answer the *Eikon Basilike*, although Cromwell was anxious he should do so, the task which he declined being afterwards performed by Milton in his *Iconoclastes*. In 1650 Selden passed the first part of *De Synedrion et Prefectura Juridicis Veterum Ebræorum* through the press, the second and third parts being severally published in 1653 and 1655, and in 1652 he wrote a preface and collated some of the manuscripts for Sir Roger Twysden's *Historiæ Anglicæ Scriptores Decem*. His last publication was a vindication of himself from certain charges advanced against him and his *Mare Clausum* in 1653 by Theodore Graswinckel, a Dutch jurist.

After the death of the earl of Kent in 1639 Selden lived permanently under the same roof with his widow. It is believed that he was married to her, although their marriage does not seem to have ever been publicly acknowledged. He died at Friary House in Whitefriars on 30th November 1654, and was buried in the Temple Church, London. Within the last few years a brass tablet has been erected to his memory by the benchers of the Inner Temple in the parish church of West Tarring.

Several of Selden's minor productions were printed for the first time after his death, and a collective edition of his writings was published by Archdeacon Wilkins in 3 vols. folio in 1725, and again in 1726. His *Table Talk*, by which he is perhaps best known, did not appear until 1689. It was edited by his amanuensis, Richard Milward, who affirms that "the sense and notion is wholly Selden's," and that "most of the words" are his also. Its genuineness has sometimes been questioned, although on insufficient grounds. In Hallam's opinion it "gives perhaps a more exalted notion of Selden's natural talents than any of his learned writings," and in Coleridge's it contains "more weighty bullion sense" than he had "ever found in the same number of pages of any uninspired writer."

SELECTION AND VARIATION. See VARIATION AND SELECTION.

SELENIUM AND TELLURIUM¹ are two rather rare chemical elements discovered, the latter by Müller von Reichenstein in 1782, the former by Berzelius in 1817. Both occur only in the mineral kingdom as components of very rare minerals, most of which are compounds of one or the other or of both and sulphur with silver, lead, bismuth, antimony, gold, and other metals.

Elementary Selenium.—This, like elementary sulphur, exists in a variety of forms, which are conveniently considered as modifications of the two genera now to be described. (1) *Non-metallic selenium* includes the flocculent scarlet precipitate produced by the reduction of solution of selenium by sulphurous acid in the cold. The scarlet flocks when dried without the aid of heat assume the form of a brown-red powder of sp. gr. 4.26, which dissolves in 1000 times its weight of boiling bisulphide of carbon (at 46°·6 C.). The solution on cooling deposits most of its selenium in the form of minute monoclinic crystals of sp.

¹ Comp. CHEMISTRY, vol. v. pp. 498, 499, 501-503, 506, 508.

gr. 4·5 (isomorphous with monoclinic sulphur), which retain their solubility in bisulphide of carbon up to 100° C. At 110° C. or higher temperatures they pass into the metallic modification (see below) with evolution of heat. With the amorphous kind a similar change sets in at or above 80° C. and attains its maximum of rapidity at a point between 125° and 180° C. Fused selenium when cooled down suddenly hardens into a very dark-coloured glass of 4·28 sp. gr., soluble in bisulphide of carbon; on gradual cooling it becomes more or less completely "metallic." (2) *Metallic selenium* is a dark grey or black solid of 4·8 sp. gr.; it exhibits metallic lustre, stretches perceptibly under the hammer, and its fracture is similar to that of grey cast iron. It is insoluble in bisulphide of carbon. Its fusing point is sharply defined and lies at 217° C. At the ordinary temperature it conducts electricity, while the non-metallic modification does not; at higher temperatures, or after temporary exposure to higher temperatures, the conductivity on either side becomes an eminently variable quantity. According to Draper and Moss, glassy selenium begins to conduct electricity at 165° to 175° C., and the conductivity increases regularly as the temperature rises to near the boiling-point. With metallic selenium, which behaves similarly, the increase of conductivity is proportional to the increase of temperature to near the fusing point (217° C.); but from this point upwards it decreases rapidly and attains its minimum at 250° C. According to W. Siemens, however, selenium by long exposure to 200° C. becomes what one may call electrically metallic; the conductivity then decreases when the temperature rises, just as it does with ordinary metals. But this electrometallicity is not permanent; on continued exposure to a lower temperature it vanishes gradually, until the proportion of quasi-metal has fallen to a limit-value depending on that temperature. Very surprising is the observation of Sale that the electric conductivity of metallic selenium increases on exposure to the light; the red and ultra-red rays, as he found, act most powerfully. The effect of insolation is almost instantaneous, but on re-exposure to darkness the original condition is re-established only very gradually. W. Siemens found that his electro-metallic selenium (as produced at 200° C.) is more sensitive to light than any other kind. The conductivity of such selenium starting from darkness is raised twofold by diffuse and tenfold by direct sunlight. The specific heat of selenium, according to Regnault, is 0·0746 both in the glassy and in the metallic modification. Selenium (of any kind) boils at 700° C. (Mitscherlich). The vapour has an intense colour intermediate between that of chlorine and that of sulphur. According to Deville and Troost, at 880° C. it is 7·67 times, and at 1420° is 5·68 times, as heavy as air; theory, for $\text{Se}_2 = 1$ molecule, demands 5·47.

Elementary Tellurium.—This, the compact form, is a silver-white resplendent metal of markedly crystalline structure; the crystals are rhombohedra, and the ingot consequently is very brittle. Specific gravity 6·2. The metal fuses at about 500° C., and is distillable at very high temperatures. Its vapour is golden yellow and has a very brilliant absorption-spectrum. The vapour density, according to Deville and Troost, is 9·08 at 1439° C. (air = 1), corresponding to $\text{Te}_2 = 1$ molecule. A bar of tellurium becomes feebly electrical when rubbed with a woollen cloth. The electric conductivity, like that of selenium, is largely influenced by the temperature and previous exposure to heat, and it increases after exposure to light, though not to the same extent as selenium does. Starting from the ordinary temperature the conductivity decreases up to some point between 90° and 145° C.; it then increases up to 200° C. (the highest temperature tried); on cooling it decreases steadily, and finally is only one-fifth or one-sixth of

what it was at 200°. The numerical value at 200° (silver = 100) was found equal to 0·0035 to 0·0031 (F. Exner).

Extraction of the Elementary Substances.—If seleniferous sulphur or pyrites is used for the manufacture of oil of vitriol by the chamber process, most of the selenium accumulates as such in the "chamber mud," from which it may be extracted by the following method of Wöhler's. The mud, after having been thoroughly washed and dried, is fused with alkaline nitrate and carbonate, to convert the selenium into selenate (SeO_4K_2 or Na_2), which is extracted by means of water. The filtered solution is boiled with hydrochloric acid to convert the selenic into selenium acid ($\text{SeO}_3 + 2\text{HCl} = \text{Cl}_2 + \text{H}_2\text{O} + \text{SeO}_2$), and this last is then reduced by addition of sulphurous acid and heating, when the selenium comes down as a red precipitate ($\text{SeO}_2 + 2\text{SO}_2 = 2\text{SO}_3 + \text{Se}$). A richer material than chamber mud is seleniferous ore-smoke as produced in Mansfeld, which likewise contains free selenium. Its extraction, according to O. Pettersen and F. Nilson, is best effected by digestion with concentrated solution of cyanide of potassium at 80° C., which converts the selenium into selenocyanide (SeNCK), easily extractable by water. The filtered solution is acidified with hydrochloric acid and allowed to stand, when the selenium (through the spontaneous decomposition of the SeNC into NCH and Se) comes down as a precipitate.

Tellurium is generally prepared from Transylvanian gold ore. The powdered ore is oxidized by means of hot nitric acid and the least sufficiency of hydrochloric acid, the excess of nitric acid being chased away by evaporation, and the residue mixed with sulphuric acid (to convert the lead into insoluble sulphate), and with some tartaric acid to prevent precipitation of tellurous acid (TeO_2) in the subsequent treatment with water. From the filtered aqueous solution the gold is removed by addition of ferrous sulphate and by filtration. The filtrate is treated with sulphurous acid to reduce the tellurous acid to tellurium, which separates out as a black precipitate. The precipitated metal is fused down and then sublimed at a very high temperature, in a porcelain tube, in a current of hydrogen, to remove non-volatile impurities and eliminate the last trace of selenium (SeH_2).

Chemical Relations.—Selenium and tellurium are similar in their chemical character to sulphur; the gradation of properties within the triad is in the order of the atomic weights, which are $\text{S} = 32\cdot06$, $\text{Se} = 79\cdot07$, $\text{Te} = 128$ ($\text{O} = 16$). In oxygen or air the elementary substances burn readily into (solid) dioxides (SeO_2 , TeO_2), in the case of selenium with production of a characteristic stench of putrid radish, owing probably to the formation of a trace of hydride, SeH_2 . Nitric acid, in the heat, converts sulphur directly into sulphuric acid. In the case of the two rare elements the oxidation stops at the stage corresponding to sulphurous acid. The acids SeO_3H_2 and TeO_3H_2 are not liable to further oxidation by any of the wet-way reagents (HNO_3 , H_2O and Cl_2 , Br_2 , I_2 , &c.) which convert sulphurous into sulphuric acid.

By fusion with nitre and alkaline carbonate the three elements, in their elementary or less oxygenated forms, are readily converted into salts, R_2SeO_4 (sulphates, &c., $\text{Z} = \text{S}$, Se , or Te). Selenic and telluric acids (H_2SeO_4), unlike sulphuric, when boiled with aqueous hydrochloric acid, are gradually reduced to the lower acids (Se or Te) O_3H_2 , with evolution of chlorine; and the lower acids are readily reduced to (precipitates of) elementary selenium and tellurium respectively by the action of sulphurous acid in the heat. Chlorine combines readily with elementary selenium and tellurium into dichlorides (Se or Te) Cl_2 , which, however, on continued chlorination are at last completely converted into the tetrachlorides (Se or Te) Cl_4 . These last, unlike the corresponding sulphur compound, are distillable without decomposition. Metals capable of uniting directly with sulphur as a rule unite also with selenium and tellurium into corresponding compounds. Hydrogen unites with elementary selenium and tellurium in the heat into gaseous hydrides (Se or Te) H_2 , closely similar to sulphuretted hydrogen. But, as these hydrides are liable to dissociation, the pure compounds must be prepared by the decomposition of the zinc compounds ZnZ with hydrochloric acid. For the description of individual compounds reference must be made to the handbooks of chemistry. (W. D.)

SELEUCIA, or **SELEUCIA** (Σελεύκεια). Of the numerous ancient towns of this name the most famous are—(1) the great city on the Tigris founded by Seleucus I. Nicator (see vol. xviii. p. 587), of the greatness and decay of which an account has been given in vol. xviii. p. 601; (2) a city on the northern frontier of Syria towards Cilicia, some miles north of the mouth of the Orontes, also founded by Seleucus I., and forming with Antioch, Apamea, and Laodicea the Syrian Tetrapolis. It served as the port of Antioch (Acts xiii. 4). Considerable ruins are still visible, especially a great cutting through solid rock, about two-thirds of a mile long, which Polybius speaks of as the road from the city to the sea.

SELEUCIDS. See **MACEDONIAN EMPIRE**, vol. xv. p. 142, and **PERSIA**, vol. xviii. p. 585 *sq.*

SELIM or **SALIM**, the title borne by three emperors of the Ottoman Turks. For **SELIM I.**, emperor from 1512 to 1520, see **PERSIA**, vol. xviii. pp. 635-636, and **TURKEY**. **SELIM II.**, grandson of the preceding, was sultan from 1566 to 1574. See **TURKEY**. **SELIM III.**, son of Sultan Mustafa III., succeeded his father in 1789 and was deposed in 1807. See **TURKEY**.

SELIMNIA. See **SLIVEN**.

SELINUS (Σελινούς), one of the most important of the Greek colonies in Sicily, near the rivers Hypsas and Selinus on the south-west coast, was founded, probably about 628 B.C., by colonists from Megara Hyblaea in the east of Sicily and others from the parent city of Megara on the Saronic Gulf of Greece (see Thuc., vi. 4, vii. 57, and Strabo, vi. p. 272). The name of the city and the little river (see H in fig.) on which it stands was derived from the wild parsley (σέλινον) which grew there in abundance (comp. vol. xvii. p. 639). Many autonomous coins of Selinus exist, dating from the 5th and 4th centuries B.C. The tetradrachms have on the obverse a youth, representing the river Selinus, sacrificing at an altar,¹ and, in the field, a parsley leaf,—legend, ΣΕΛΙΝΟΣ; on the reverse, Apollo and Artemis in a biga,—legend, ΣΕΛΙΝΟΝΤΙΟΝ (retrograde). Didrachms have a similar obverse with the river Hypsas,—legend, ΗΥΨΑΣ; reverse, Heracles slaying a bull,—legend, ΣΕΛΙΝΟΝΤΙΟΝ. As early as 580 B.C. the citizens of Selinus were at war with the adjoining people of Segesta, a non-Hellenic race who occupied the province north of Selinus; the success of the Segestans on this occasion was mainly owing to aid given them by colonists from Rhodes and Cnidus. Little is known about the early history of Selinus; but the city evidently grew rapidly in wealth and importance, and soon extended its borders 15 miles westwards to the river Mazarus and eastwards as far as the Halycus (Diod., xiii. 54; Herod., v. 46). Thucydides (vi. 20) mentions its power and wealth and especially the rich treasures in its temples. From its early oligarchical form of government Selinus passed to a short-lived despotism under the tyrant Pithagoras, who was deposed soon after 510 B.C. In 480 B.C., when the Carthaginian Hamilcar invaded Sicily, the city took his side against their fellow Hellenes. In 416 B.C. a new dispute between Selinus and Segesta was eventually the cause of the fatal Athenian expedition against Sicily, the Athenians acting as allies of Segesta and the Syracusans as allies of Selinus. The conclusion of this expedition (see **SYRACUSE**) left Segesta at the mercy of the Selinuntines, whose rapacity and cruelty soon brought about their own destruction, through the aid which the Segestans obtained from Carthage. In 409 B.C. Hannibal, with an overwhelming force, took and destroyed the city, the walls of which were razed to the ground. He killed about 16,000 of the inhabitants, took 5000 prisoners, and only a remnant of 2600 escaped to Agrigentum (Diod., xiii. 54-59). The survivors were afterwards allowed to return and to rebuild Selinus as a city subject to the Carthaginians, under whose yoke, in spite of their attempts to regain freedom, the Selinuntines remained till c. 250, the close of the First Punic War; after this the Carthaginians transferred the inhabitants of Selinus to Lilybæum, and completely destroyed the city (Diod. xxiv.). It was never rebuilt, and is mentioned by Strabo (vi. p. 272) as being one of the extinct cities of Sicily.²

The ancient city occupied two elevated plateaus at the edge of the sea and also part of the surrounding plain. The western of these elevations formed the acropolis; on the other was the agora. The walls of the acropolis can still be traced round the whole circuit; the only entrance was on the north-east. Remains also exist of long walls connecting the city and its port. The chief glory of Selinus was its double group of great temples,—three on the acropolis and three in the agora, one of which was the largest peripteral temple in the world. All are completely ruined, but the materials of each still remain almost perfect, though scattered in confused heaps of stone; the extraordinary completeness of these fragments is owing to the fact that the site has never been occupied since the final transference of the inhabitants in 250 B.C., and thus the scattered blocks have never been taken as materials for later structures. Of all the six temples³ none are later than the 5th century B.C., and those on the acropolis probably date from about 628 B.C., soon after the first settlement. The sculptured metopes from three of the temples are among the most important examples of early Hellenic art (see **ARCHAEOLOGY**, vol. ii. p. 349, and Bendorff, *Die Metopen von Selinunt*). The buildings themselves are of the highest interest, being the earliest known examples of the Doric style, and differing in many important details from all other examples, even such early ones as the temples at Corinth and Syracuse.

The three temples on the acropolis (A, C, D in fig.) stand side by side, with their axes north-west to south-east; all are hexastyle and peripteral, with either thirteen or fourteen columns on the sides.

Their stylobates have four high steps along the sides, with an easier approach of more steps at the north-west fronts. To the middle one of the three belong the very archaic metopes described in vol. ii. p. 349. All have a rather narrow cella with pronaos and opisthodomus. Their archaic peculiarities are the rapid diminution of the columns, the absence of entasis, the narrow mutules over the metopes, and especially a curious cavetto or necking under the usual hypotrachelia. No other example of this feature was

Selinus.

A, C, D, Temples on acropolis. B, Small prostyle tetrastyle aedícula. E, F, G, Temples on eastern hill. a, a, Remains of buildings outside acropolis walls. H, River Selinus.

Dr Schliemann and Dr Dörpfeld discovered a similar Doric capital among the ruins of the citadel of Tiryns. The Tiryns capital dates probably from a little before 600 B.C. and appears to be nearly contemporary with that at Selinus. Between temples A and C are remains of a small prostyle tetrastyle aedícula (B) of the Doric order.⁴ The second group of three Doric temples (E, F, G) belongs to a rather later date,—probably 500 to 440 B.C. The first two (E and F) have very narrow cella, so that they are pseudo-dipteral. They also are hexastyle, with fourteen columns on the sides. Though still early in detail, they are without the curious necking of the acropolis temples. The sculptured metopes of temple E are of extraordinary beauty and interest, and appear to date from the finest period of Greek art—the age of Phidias or perhaps that of Myron. The chief subjects are Zeus and Hera on Mount Olympus, Artemis and Actæon, and Heracles defeating an Amazon. They are of the noblest style, simple and highly sculptural in treatment, and full of grace and expression. One remarkable peculiarity in their technique is that the nude parts of the female figures (heads, feet, and hands) are executed in white marble, while the rest of the reliefs are in the native grey tufa, which originally was covered with marble-dust stucco and then painted. The whole of the stonework of all the temples was treated in a similar way, and gives most valuable examples of early Greek coloured decoration. Recent excavations at Selinus have shown that in many cases the cornices and other architectural features were covered with moulded slabs of terra cotta, all richly coloured

³ The stone of which all these temples were built came from a quarry a few miles north-west of Selinus (mod. Campobello). The ancient workings are very visible, and unfinished drums of columns and other blocks still exist in the quarry. It is a brown tufa-like stone.

⁴ Strange to say, Hittorff and Zanth (*Architectur Antiqua de Sicile*, Paris, 1870), in their elaborate work on this subject, restore this aedícula with a Doric entablature on Ionic columns; a good many other similar absurdities occur in this richly illustrated work. More judgment is shown in Serradifallo's *Antica Selinunt* (Palermo, 1831-42), though it is not always accurate in measurements.

¹ Sculptured on the altar is a cock, in allusion to the aid given by Æsculapius against the fever which was caused by the marshy site. Drainage works directed by Empedocles are said to have rendered the site healthy (Diog. Laër., viii. 2, 11).

² Roman sulphur baths existed under the name Thermæ Selinuntiae, but these were about 20 miles east of the site of the ancient Selinus.

(see Dürpfeld, *Die Verwendung von Terracotten*, Berlin, 1881, and TERRACOTTA). The great temple of Zeus¹ (G in fig.) was the largest peripteral temple of the whole Hellenic world, being almost exactly the same size as the enormous pseudo-peripteral Olympæum at the neighbouring Agrigento. It was octastyle, pseudodipteral, with seventeen columns on the sides, and measures 360 by 162 feet; the columns are 10 feet 7½ inches at the base and were 48 feet 7 inches high. This gigantic building was never quite completed, though the whole of the main structure was built. Most of the columns still remain unfluted. In spite of the proportional narrowness of its cella, it had an internal range of columns, probably two orders high, like those within the cella at Pæstum. The axes of these last three temples have exactly the same inclination as those on the acropolis. The great temple of Zeus possesses some of the curious archaisms of the acropolis temples, and, though never completed, it was probably designed and begun at an earlier date than the two adjacent buildings. These peculiarities are the ungracefully rapid diminution of the shaft and the cavetto under the necking of the capitals. The whole of these six massive buildings now lie in a complete state of ruin, a work of evidently wilful destruction on the part of the Carthaginians, as the temple at Segesta, not many miles distant, has still every column and its whole entablature quite perfect; so it is impossible to suppose that an earthquake was the cause of the utter ruin at Selinus. Few or no marks of fire are visible on the stone blocks. (J. H. M.)

SELJUKS is the name of several Turkish dynasties, issued from one family, which reigned over large parts of Asia in the 11th, 12th, and 13th centuries of our era. The history of the Seljûks forms the first part of the history of the Turkish empire. Proceeding from the deserts of Turkestan, the Seljûks reached the Hellespont; but this barrier was crossed and a European power founded by the Ottomans (Osmanli). The Seljûks inherited the traditions and at the same time the power of the previous Arabian empire, of which, when they made their appearance, only the shadow remained in the person of the 'Abbâsid caliph of Baghdâd. It is their merit from a Mohammedan point of view to have re-established the power of orthodox Islam and delivered the Moslem world from the supremacy of the caliph's Shî'ite competitors, the Fâtimites of Egypt, and from the subversive influence of ultra-Shî'ite tenets, which constituted a serious danger to the duration of Islam itself. Neither had civilization anything to fear from them, since they represented a strong neutral power, which made the intimate union of Persian and Arabian elements possible, almost at the expense of the national Turkish,—literary monuments in that language being during the whole period of the Seljûk rule exceedingly rare.

The first Seljûk rulers were Toghrul Beg, Chaqir Beg, and Ibrahim Niyâl, the sons of Mikail, the son of Seljûk, the son of Tukâk (also styled Timûryâlik, "iron bow"). They belonged to the Turkish tribe of the Ghuzz (Οἱ ζοι of Const. Porphy. and the Byzantine writers), which traced its lineage to Oghuz, the famous eponymic hero not only of this but of all Turkish tribes. There arose, however, at some undefined epoch a strife on the part of this tribe and some others with the rest of the Turks, because, as the latter allege, Ghuzz, the son (or grandson) of Yafeth (Japhet), the son of Nûh (Noah), had stolen the genuine rain-stone, which Turk, also a son of Yafeth, had inherited from his father. By this party, as appears from this tradition, the Ghuzz were not considered to be genuine Turks, but to be Turkmans (that is, according to a popular etymology, resembling Turks). But the native tradition of the Ghuzz was unquestionably right, as they spoke a pure Turkish dialect. The fact, however, remains that there existed a certain animosity between the Ghuzz and their allies and the rest of the Turks, which increased as the former became converted to Islam (in the course of the 4th century of the Flight). The Ghuzz were settled at that time in Transoxiana, especially at Jand, a well-

known city on the banks of the Jaxartes, not far from its mouth. Some of them served in the armies of the Ghaznavids Sebuktegin and Mahmûd (997-1030); but the Seljûks, a royal family among them, had various relations with the reigning princes of Transoxiana and Khârizm, which cannot be narrated here.² But, friends or foes, the Ghuzz became a serious danger to the adjoining Mohammedan provinces from their predatory habits and continual raids, and the more so as they were very numerous. It may suffice to mention that, under the leadership of Israil or Pîgu Arslân, they crossed the Oxus and spread over the eastern provinces of Persia, everywhere plundering and destroying. The imprisonment of this chieftain by Mas'ûd, the son and successor of Mahmûd, was of no avail: it only furnished his nephews with a ready pretext to cross the Oxus likewise in arms against the Ghaznavids. We pass over their first conflicts and the unsuccessful agreements that were attempted, to mention the decisive battle near Merv (1040), in which Mas'ûd was totally defeated and driven back to Ghazna (Ghazni). Persia now lay open to the victors, who proclaimed themselves independent at Merv (which became from that time the official capital of the principal branch of the Seljûks), and acknowledged Toghrul Beg as chief of the whole family. After this victory the three princes Toghrul Beg, Chaqir Beg, and Ibrahim Niyâl separated in different directions and conquered the Mohammedan provinces east of the Tigris; the last-named, after conquering Hamadân and the province of Jebel, penetrated as early as 1048, with fresh Ghuzz troops, into Armenia and reached Melazkerd, Erzerûm (Erzeroum), and Trebizond. This excited the jealousy of Toghrul Beg, who summoned him to give up Hamadân and the fortresses of Jebel; but Ibrahim refused, and the progress of the Seljûkian arms was for some time checked by internal discord,—an ever-recurring event in their history. Ibrahim was, however, compelled to submit.

At this time the power of the 'Abbâsid caliph of Baghdâd (Al-Kâim bi-amr illâh) was reduced to a mere shadow, as the Shî'ite dynasty of the Bûyids and afterwards his more formidable Fâtimite rivals had left him almost wholly destitute of authority. The real ruler at Baghdâd was a Turk named Basâsîrî, lieutenant of the last Bûyid, Al-Malik ar-Rahîm. Nothing could, therefore, be more acceptable to the caliph than the protection of the orthodox Toghrul Beg, whose name was read in the official prayer (khotba) as early as 1050. At the end of the same year the Seljûk entered the city and after a tumult seized the person of Malik ar-Rahîm. Basâsîrî had the good fortune to be out of his reach; after acknowledging the right of the Fâtimites, he gathered fresh troops and incited Ibrahim Niyâl to rebel again, and he succeeded so far that he re-entered Baghdâd at the close of 1058. The next year, however, Toghrul Beg got rid of both his antagonists, Ibrahim being taken prisoner and strangled with the bowstring, while Basâsîrî fell in battle. Toghrul Beg now re-entered Baghdâd, re-established the caliph, and was betrothed to his daughter, but died before the consummation of the nuptials (September 1063). Alp Arslân, the son of Chaqir Beg, succeeded his uncle and extended the rule of his family beyond the former frontiers. He made himself master, e.g., of the important city of Aleppo; and during his reign a Turkish emir, Atsiz, wrested Palestine and Syria from the hands of the Fâtimites. Nothing, however, added more to his fame than his successful expeditions against the Greeks, especially that of 1071, in which the Greek emperor Romanus Diogenes was taken prisoner and forced to ransom himself for a

¹ The dedication of the five smaller temples is unknown; some were probably consecrated to Poseidon, Apollo, and Artemis. The existing metope reliefs are preserved in the museum at Palermo.

² Comp. Sachau, "Zur Geschichte und Chronologie von Khwârizm," in *Sitzungsberichte* of the Vienna Acad., lxxiv. 304 sq.

large sum. The foundation of the Seljūk empire of Rūm (Asia Minor, see below) was the immediate result of this great victory. Alp Arslán afterwards undertook an expedition against Turkestan, and met with his death at the hands of a captured chief, Jusof Barzami, whom he had intended to shoot with his own hand.

Malik Sháh, the son and successor of Alp Arslán, had to encounter his uncle Káwurd, founder of the Seljūkian empire of Kermán (see below), who claimed to succeed Alp Arslán in accordance with the Turkish laws, and led his troops towards Hamadán. However, he lost the battle that ensued, and the bowstring put an end to his life (1073). Malik Sháh regulated also the affairs of Asia Minor and Syria, conceding the latter province as an hereditary fief to his brother Tutush, who established himself at Damascus and killed Atsiz. He, however, like his father Alp Arslán, was indebted for his greatest fame to the wise and salutary measures of their vizier, Nizám al-Mulk. This extraordinary man, associated by tradition with 'OMAR KHAYYÁM (*q.v.*), the well-known mathematician and free-thinking poet, and with Hasan b. Sabbáh, afterwards the founder of the Ismaelites or Assassins, was a renowned author and statesman of the first rank, and immortalized his name by the foundation of several universities (the Nizámiyah at Baghdád), observatories, mosques, hospitals, and other institutions of public utility. At his instigation the calendar was revised and a new era, dating from the reign of Malik Sháh and known as the Jelalian, was introduced. Not quite forty days before the death of his master this great man was murdered by the Ismaelites. He had fallen into disfavour shortly before because of his unwillingness to join in the intrigues of the princess Turkán Khátún, who wished to secure the succession to the throne for her infant son Mahmúd at the expense of the elder sons of Malik Sháh.

Constitution and Government of the Seljūk Empire.—It has been already observed that the Seljūks considered themselves the defenders of the orthodox faith and of the Abbásid caliphate, while they on their side represented the temporal power which received its titles and sanction from the successor of the Prophet. All the members of the Seljūk house had the same obligations in this respect, but they had not the same rights, as one of them occupied relatively to the others a place almost analogous to that of the great khán of the Mongols in later times. This position was inherited from father to son, though the old Turkish idea of the rights of the elder brother often caused rebellions and violent family disputes. After the death of Malik Sháh the head of the family was not strong enough to enforce obedience, and consequently the central government broke up into several independent dynasties. Within the limits of these minor dynasties the same rules were observed, and the same may be said of the hereditary fiefs of Turkish emirs not belonging to the royal family, who bore ordinarily the title of *atabek* (properly "father bey"), *e.g.*, the atabeks of Fars, of Adharbaiján (Azerbaijan), of Syria, &c. The title was first given to Nizám al-Mulk and expressed the relation in which he stood to the prince,—as *lala*, "tutor." The affairs of state were managed by the diván under the presidency of the vizier; but in the empire of Rūm its authority was inferior to that of the *perwāneh*, whom we may name "lord chancellor." In Rūm the feudal system was extended to Christian princes, who were acknowledged by the sultan on condition of paying tribute and serving in the armies. The court dignitaries and their titles were manifold; not less manifold were the royal prerogatives, in which the sultans followed the example set by their predecessors, the Búyids.

Notwithstanding the intrigues of Turkán Khátún, Malik Sháh was succeeded by his elder son Barkiyárok (1092-1104), whose short reign was a series of rebellions and strange adventures such as one may imagine in the story of a youth who is by turns a powerful prince and a miserable fugitive.¹ Like his brother Mohammed (1104-1118), who successfully rebelled against him, his most dangerous enemies were the Ismaelites, who had succeeded in taking the fortress of Alamut (north of Kazvín) and become a

formidable political power by the organization of bands of *fidáwís*, who were always ready, even at the sacrifice of their own lives, to murder any one whom they were commanded to slay (see ASSASSINS).

Mohammed had been successful by the aid of his brother Sinjar, who from the year 1097 held the province of Khorásan with the capital Merv. After the death of Mohammed Sinjar became the real head of the family, though 'Irák acknowledged Mahmúd, the son of Mohammed. Thus there originated a separate dynasty of 'Irák with its capital at Hamadán; but Sinjar during his long reign often interfered in the affairs of the new dynasty, and every occupant of the throne had to acknowledge his supremacy. In 1117 he led an expedition against Ghazna and bestowed the throne upon Behráam Sháh, who was also obliged to mention Sinjar's name first in the official prayer at the Ghaznavid capital,—a prerogative that neither Alp Arslán nor Malik Sháh had attained. In 1134 Behráam Sháh failed in this obligation and brought on himself a fresh invasion by Sinjar in the midst of winter; a third one took place in 1152, caused by the doings of the Ghurids (Hosain Jihánsúz, or "world-burner"). Other expeditions were undertaken by him against Khárizm and Turkestan; the government of the former had been given by Barkiyárok to Mohammed b. Anushtegin, who was succeeded in 1128 by his son Atsiz, and against him Sinjar marched in 1138. Though victorious in this war, Sinjar could not hinder Atsiz from afterwards joining the gurkhán (great khán) of the then rapidly rising empire of the Karachitai, at whose hands the Seljūk suffered a terrible defeat at Samarkand in 1141. By the invasion of these hordes several Turkish tribes, the Ghuzz and others, were driven beyond the Oxus, where they killed the Seljūk governor of Balkh, though they professed to be loyal to Sinjar. Sinjar resolved to punish this crime; but his troops deserted and he himself was taken prisoner by the Ghuzz, who kept him in strict confinement during two years (1153-55), though treating him with all outward marks of respect. In the meantime they plundered and destroyed the flourishing cities of Merv and Nishápúr; and when Sinjar, after his escape from captivity, revisited the site of his capital he fell sick of sorrow and grief and died soon afterwards (1157). His empire fell to the Karachitai and afterwards to the sháh of Khárizm. Of the successors of Mohammed in 'Irák we give only the names with the date of the death of each:—Mahmúd (1131); Toghrul, son of Mohammed, proclaimed by Sinjar (1134); Mas'úd (1152); Malik Sháh and Mohammed (1159), sons of Mahmúd; Sulaimán Sháh, their brother (1161); Arslán, son of Toghrul (1175); and Toghrul, son of Arslán, killed in 1194 by Inánej, son of his atabek, Mohammed, who was in confederation with the Khárizm sháh of the epoch, Takash. This chief inherited his possessions; Toghrul was the last representative of the Seljūks of 'Irák.

The province of Kermán was one of the first conquests of the Seljūks, and became the hereditary fief of Káwurd, the son of Chaqir Beg. Mention has been made of his war with Malik Sháh and of his ensuing death (1073). Nevertheless his descendants were left in possession of their ancestor's dominions; and till 1170 Kermán, to which belonged also the opposite coast of 'Omán, enjoyed a well-ordered government, except for a short interruption caused by the deposition of Irán Sháh, who had embraced the tenets of the Ismaelites, and was put to death (1101) in accordance with a fatwa of the ulema. But after the death of Toghrul Sháh (1170) his three sons disputed with each other for the possession of the throne, and implored foreign assistance, till the country became utterly devastated and fell an easy prey to some bands of Ghuzz, who, under the leadership of Malik Dinár (1185), marched into

¹ A sketch of his reign has been given by Defrémery, *Journ. Asiatique*, 1853, i. 425 sq., ii. 217 sq.

Kermán after harassing Sinjar's dominions. Afterwards the sháhs of Khárizm took this province.¹

The Seljúkian dynasty of Syria came to an end after three generations, and its later history is interwoven with that of the crusaders. The first prince was Tutush, mentioned above, who perished, after a reign of continuous fighting, in battle against Barkiyárok near Rai (1095). Of his two sons, the elder, Ridhwán, established himself at Aleppo (died 1113); the younger, Duḡak, took possession of Damascus, and died in 1103. The sons of the former, Alp Arslán and Sultán Sháh, reigned a short time nominally, though the real power was exercised by Lúlú till 1117. We cannot, however, enter here into the very complicated history of these two cities, which changed their masters almost every year till the time of Zengi and Núr ed-dín.

After the great victory of Alp Arslán in which the Greek emperor was taken prisoner (1071), Asia Minor lay open to the inroads of the Turks. Hence it was easy for Sulaimán, the son of Kutulmish,² the son of Arslán Pígu (Israil), to penetrate as far as the Hellespont, the more so as after the captivity of Romanus, two rivals, Nicephorus Bryennius in Asia and another Nicephorus named Botoniatas in Europe, disputed the throne with one another. The former appealed to Sulaimán for assistance, and was by his aid brought to Constantinople and seated on the imperial throne. But the possession of Asia Minor was insecure to the Seljúks as long as the important city of Antioch belonged to the Greeks, so that we may date the real foundation of this Seljúk empire from the taking of that city by the treason of its commander Philaretus in 1084, who afterwards became a vassal of the Seljúks. The conquest involved Sulaimán in war with the neighbouring Mohammedan princes, and he met his death soon afterwards (1086), near Shaizar, in a battle against Tutush. Owing to these family discords the decision of Malik Sháh was necessary to settle the affairs of Asia Minor and Syria; he kept the sons of Sulaimán in captivity, and committed the war against the unbelieving Greeks to his generals Bursuk (Προσούχ) and Buzán (Πουζανος). Barkiyárok, however, on his accession (1092), allowed Kilig Arslán, the son of Sulaimán, to return to the dominions of his father. Acknowledged by the Turkish emirs of Asia Minor, he took up his residence in Nicæa, and defeated the first bands of crusaders under Walter the Penniless and others (1096); but, on the arrival of Godfrey of Bouillon and his companions, he was prudent enough to leave his capital in order to attack them as they were besieging Nicæa. He suffered, however, two defeats in the vicinity, and Nicæa surrendered on 23d June 1097. As the crusaders marched by way of Dorylæum and Iconium towards Antioch, the Greeks subdued the Turkish emirs residing at Smyrna, Ephesus, Sardis, Philadelphia, Laodicea, Lampes, and Polybotus;³ and Kilig Arslán, with his Turks, retired to the north-eastern parts of Asia Minor, to act with the Turkish emirs of Sívás (Sebaste), known under the name of the Danishmand.

The history of the dynasty of the Danishmand is still very obscure, notwithstanding the efforts of Mordtmann, Schlumberger, Karabacek, Sallet, and others to fix some chronological details, and it is almost impossible to harmonize the different statements of the Armenian, Syriac, Greek, and Western chronicles with those of the Arabic, Persian, and Turkish. The coins are few in number, very difficult to decipher, and often without date. The founder of the dynasty was a certain Tailu, who is said to have been a schoolmaster (danishmand), probably because he understood Arabic and Persian. His descendants, therefore, took the style of "Ibn Danishmand," often without their own name. They took posses-

sion of Sívás, Tokát, Nicsár, Ablastán, Malatiah, probably after the death of Sulaimán, though they may have established themselves in one or more of these cities much earlier, perhaps in 1071, after the defeat of Romanus Diogenes. During the first crusade the reigning prince was Kumushtegin (Ahmed Gházi), who defeated the Franks and took prisoner the prince of Antioch, Bohemond, afterwards ransomed. He died probably in 1106, and was succeeded by his son Mohammed (d. 1143), after whom reigned Jaghi Basán; but it is very probable that other members of the same dynasty reigned at the same time in the cities already named, and in some others, e.g., Kastamuni.

Afterwards there arose a natural rivalry between the Seljúks and the Danishmand, which ended with the extinction of the latter about 1175. Kilig Arslán took possession of Mosul in 1107, and declared himself independent of the Seljúks of 'Irák; but in the same year he was drowned in the Chaboras through the treachery of his own emirs, and the dynasty seemed again destined to decay, as his sons were in the power of his enemies. The sultan Mohammed, however, set at liberty his eldest son Malik Sháh, who reigned for some time, until he was treacherously murdered (it is not quite certain by whom), being succeeded by his brother Mas'úd, who established himself at Konieh (Iconium), from that time the residence of the Seljúks of Rúm. During his reign—he died in 1155—the Greek emperors undertook various expeditions in Asia Minor and Armenia; but the Seljúk was cunning enough to profess himself their ally and to direct them against his own enemies. Nevertheless the Seljúkian dominion was petty and unimportant and did not rise to significance till his son and successor, Kilig Arslán II., had subdued the Danishmands and appropriated their possessions, though he thereby risked the wrath of the powerful atabek of Syria, Nur ed-dín, and afterwards that of the still more powerful Saladin. But as the sultan grew old his numerous sons, who held each the command of a city of the empire, embittered his old age by their mutual rivalry, and the eldest, Ḳotb ed-dín, tyrannized over his father in his own capital, exactly at the time that Frederick I. (Barbarossa) entered his dominions on his way to the Holy Sepulchre (1190). Konieh itself was taken and the sultan forced to provide guides and provisions for the crusaders. Kilig Arslán lived two years longer, finally under the protection of his youngest son, Kaikhosrau, who held the capital after him (till 1199) until his elder brother, Rokn ed-dín Sulaimán, after having vanquished his other brothers, ascended the throne and obliged Kaikhosrau to seek refuge at the Greek emperor's court. This valiant prince saved the empire from destruction and conquered Erzerúm, which had been ruled during a considerable time by a separate dynasty, and was now given in fief to his brother, Mughít ed-dín Toghrul Sháh. But, marching thence against the Georgians, Sulaimán's troops suffered a terrible defeat; after this Sulaimán set out to subdue his brother Mas'úd Sháh, at Angora, who was finally taken prisoner and treacherously murdered. This crime is regarded by Oriental authors as the reason of the premature death of the sultan (in 1204); but it is more probable that he was murdered because he displeased the Mohammedan clergy, who accused him of atheism. His son, Kilig Arslán III., was soon deposed by Kaikhosrau (who returned), assisted by the Greek Maurozomes, whose daughter he had married in exile. He ascended the throne the same year in which the Latin empire was established in Constantinople, a circumstance highly favourable to the Turks, who were the natural allies of the Greeks (Theodore Lascaris) and the enemies of the crusaders and their allies, the Armenians. Kaikhosrau, therefore, took in 1207 from the Italian Aldobrandini the important harbour of Attalia (Adalia); but his conquests in this direction were put an end to by his attack upon Lascaris, for in the battle that ensued he perished in single combat with his royal antagonist (1211).

¹ An outline of the history of this branch of the Seljúks is given in *Z.D.M.G.*, 1885, pp. 362-401.

² This prince rebelled against Alp Arslán in 1064, and was found dead after a battle.

³ The Turkmans who dwelt in these western parts of Asia Minor, which were never regained by the Seljúks, were called Utch (Outsiders).

His son and successor, Kaikávús, made peace with Lascaris and extended his frontiers to the Black Sea by the conquest of Sinope (1214). On this occasion he was fortunate enough to take prisoner the Comnenian prince (Alexis) who ruled the independent empire of Trebizond, and he compelled him to purchase his liberty by acknowledging the supremacy of the Seljúks, by paying tribute, and by serving in the armies of the sultan. Elated by this great success and by his victories over the Armenians, Kaikávús was induced to attempt the capture of the important city of Aleppo, at this time governed by the descendants of Saladin; but the affair miscarried. Soon afterwards the sultan died (1219) and was succeeded by his brother, Alá ed-dín Kaikobád, the most powerful and illustrious prince of this branch of the Seljúks, renowned not only for his successful wars but also for his magnificent structures at Konieh, Alaja, Sívás, and elsewhere, which belong to the best specimens of Saracenic architecture. The town of Alaja was the creation of this sultan, as previously there existed on that site only the fortress of Candelor, at that epoch in the possession of an Armenian chief, who was expelled by Kaikobád, and shared the fate of the Armenian and Frankish knights who possessed the fortresses along the coast of the Mediterranean as far as Selefké (Seleucia). Kaikobád extended his rule as far as this city, and desisted from further conquest only on condition that the Armenian princes would enter into the same kind of relation to the Seljúks as had been imposed on the Comnenians of Trebizond. But his greatest military fame was won by a war which, however glorious, was to prove fatal to the Seljúk empire in the future: in conjunction with his ally, the Eyyúbid prince Al-Ashraf, he defeated the Khárizm sháh Jelál ed-dín near Arzengán (1230). This victory removed the only barrier that checked the progress of the Mongols. During this war Kaikobád put an end to the collateral dynasty of the Seljúks of Erzerúm and annexed its possessions. He also gained the city of Khelát with dependencies that in former times had belonged to the Sháh-i-Armen, but shortly before had been taken by Jelál ed-dín; this aggression was the cause of the war just mentioned. The acquisition of Khelát led, however, to a new war, as Kaikobád's ally, the Eyyúbid prince, envied him this conquest. Sixteen Mohammedan princes, mostly Eyyúbids, of Syria and Mesopotamia, under the leadership of Al-Malik al-Kámil, prince of Egypt, marched with considerable forces into Asia Minor against him. Happily for Kaikobád, the princes mistrusted the power of the Egyptian, and it proved a difficult task to penetrate through the mountainous well-fortified accesses to the interior of Asia Minor, so that the advantage rested with Kaikobád, who took Kharput, and for some time even held Harrán, Ar-Roha, and Rakka (1232). The latter conquests were, however, soon lost, and Kaikobád himself died in 1234 of poison administered to him by his son and successor, Ghiyáts ed-dín Kaikhosrau II. This unworthy son inherited from his father an empire embracing almost the whole of Asia Minor, with the exception of the countries governed by Vatatés (Vataces) and the Christian princes of Trebizond and Lesser Armenia, who, however, were bound to pay tribute and to serve in the armies,—an empire celebrated by contemporary reports for its wealth.¹ But the Turkish soldiers were of little use in a regular battle, and the sultan relied mainly on his Christian troops, so much so that an insurrection of dervishes which occurred at this period could only be put down by their assistance. It was at this epoch also that there flourished at Konieh the greatest mystical poet of Islam, and the founder of the order of the Mawlawis, Jelál ed-dín Rúmí

(d. 1273; see RÚMÍ), and that the dervish fraternities spread throughout the whole country and became powerful bodies, often discontented with the liberal principles of the sultans, who granted privileges to the Christian merchants and held frequent intercourse with them. Notwithstanding all this, the strength and reputation of the empire were so great that the Mongols hesitated to invade it, although standing at its frontiers. But, as they crossed the border, Kaikhosrau marched against them, and suffered a formidable defeat at Kuzadág (between Arzengán and Sívás) in 1243, which forced him to purchase peace by the promise of a heavy tribute. The independence of the Seljúks was now for ever lost. The Mongols retired for some years; but, Kaikhosrau dying in 1245, the joint government of his three sons gave occasion to fresh inroads, till one of them died and Hulagu divided the empire between the other two, 'Izz ed-dín ruling the districts west of the Halys and Rokn ed-dín the eastern provinces (1259). But the former, intriguing with the Mameluke sultans of Egypt to expel his brother and gain his independence, was defeated by a Mongol army and obliged to flee to the imperial court. Here he was imprisoned, but afterwards released by the Tatars of the Crimea, who took him with them to Sarai, where he died. Rokn ed-dín was only a nominal ruler, the real power being in the hands of his perváneh, Muín ed-dín Sulaimán, who in 1267 procured an order of the Mongol Khán Abaka for his execution. The minister raised his infant son, Ghiyáts ed-dín Kaikhosrau III., to the throne, and governed the country for ten years longer, till he was entangled in a conspiracy of several emirs, who proposed to expel the Mongols with the aid of the Mameluke sultan of Egypt (Beybars or Bibars). The latter marched into Asia Minor and defeated the Mongols in the bloody battle of Ablastán (1277); but, when he advanced farther to Cæsarea, the perváneh retired, hesitating to join him at the very moment of action. Beybars, therefore, in his turn fell back, leaving the perváneh to the vengeance of the khán, who soon discovered his treason and ordered a barbarous execution. Ghiyáts ed-dín continued to reign in name till 1284, though the country was in reality governed by a Mongol viceroy. Mas'úd, the son of 'Izz ed-dín, who on the death of his father had fled from the Crimea to the Mongol khán and had received from him the government of Sívás, Arzengán, and Erzerúm during the lifetime of Ghiyáts ed-dín, ascended the Seljúk throne on the death of Ghiyáts. But his authority was scarcely respected in his own residence, for several Turkish emirs assumed independence and could only be subdued by Mongol aid, when they retired to the mountains, to reappear as soon as the Mongols were gone. Mas'úd fell, probably about 1295, a victim to the vengeance of one of the emirs, whose father he had ordered to be put to death. After him Kaikobád, son of his brother Farámarz, entered Konieh as sultan in 1298, but his reign is so obscure that nothing can be said of it; some authors assert that he governed only till 1300, others till 1315. With him ended the dynasty of the Seljúks; but the Turkish empire founded by them continued to exist under the rising dynasty of the Ottomans. (See TURKEY.)

Bibliography.—The best, though insufficient, account of the Seljúks is still De Guignes, *Histoire Générale des Huns*, bks. x.-xii., from whom Gibbon borrowed his dates. Among translations from original sources (of which the most trustworthy are yet unedited), comp. Mirkhond's *Geschichte der Seldschuken* (ed. Vullers), Giessen, 1838; *Tarikh-i-Guzideh*, French translation by Defrémery in the *Journal Asiatique*, 1848, i. 417 sq., ii. 259 sq., 334 sq.; *Seid Loemani ex Libro Turcico qui Oghuznomen inscribitur Excerpta* (ed. J. H. W. Lagus), Helsingfors, 1854 (on the Seljúks of Asia Minor exclusively, but of little value). Information respecting certain periods is given incidentally in the well-known works of Von Hammer and D'Ohsson. (M. T. H.)

¹ See the details in Vincent of Beauvais, *Speculum Historiale*, bk. xxx. chaps. 143, 144.

SELKIRK, a lowland county of Scotland, of tortuous outline, is bounded by Midlothian on the N., by Peebles on the N. and W., by Dumfries on the S., and by Roxburgh on the E. Its extreme length from south-west to north-east is 28 miles, its greatest breadth from east to west 17, and its total area 260 square miles or 166,524 acres, of which 1997 are water. This includes two detached portions, one to the north-west, surrounded by Peebles, and another on the east, the estate and barony of Sinton, separated from Roxburgh in the reign of William the Lion on the appointment of Andrew de Synton to the sheriffship of Selkirk. From its lowest altitude (300 feet) at the junction of the Gala and the Tweed the surface rises to 2433 feet at Dun Rigg, a wild and desolate summit on the western boundary. Level haughs, beds of ancient lakes, occur in the courses of the rivers; but the county is otherwise wholly mountainous and only a small proportion of it arable. Of its principal summits, Ettrick Pen (2269), Capel Fell (2223), Deer Law (2064), Herman Law (2014), are in the south, and Windlestrae Law (2161) in the north, about a mile from the borders of Midlothian. Broadly speaking, Selkirk may be said to consist of the two entire valleys of Ettrick and Yarrow and a section of the valley of Tweed, the first two sloping from the south until they merge in the last, which forms the northern portion of the county. Besides St Mary's Loch and its adjunct the Loch of the Lowes, together about $4\frac{1}{2}$ miles long, there are several others of considerable size, mostly in the eastern uplands between Ettrick and Teviotdale—the two lochs of Shaws, Clearburn Loch, Kingside Loch, Hellmuir Loch, Alemuir Loch, and Akermuir Loch. These, with the larger rivers and the mountain "burns," attract anglers to Selkirk from all parts of the kingdom.

Geologically, the Selkirk rocks are a portion of that great Silurian mass which occupies the south of Scotland from Wigtown to the north-east coast of Berwick. At no part are they known to be covered by rocks of later formation; but here and there (at Windlestrae Law and Priesthope, for example) igneous rocks protrude in massive outcrops, almost granitic, one measuring over 100 feet in thickness. The hillsides yield inexhaustible supplies of blue-grey whinstone, suitable for building; but repeated efforts to establish slate-quarries and lead-mines have ended in failure. According to records of the 16th century, gold was found at Mount Benger, Douglas Craig, and Linglie Burn,—“an ingenious gentleman” named Bevis Bulmer having been “most successful upon Henderland Moor in Ettrick Forest, where he got the greatest gold—the like to it in no other place before of Scotland.”

Corresponding with the high average altitude, the prevailing climate is cold and wet, and, as the soil is mostly thin, over a close subsoil of clayey “till,” agriculture is carried on at a disadvantage. About the middle of the 19th century large areas of virgin soil were brought under tillage; but the prudence of the “improvement” is now greatly doubted, in regard to a large proportion at least,—its restoration to permanent pasture being now found almost impracticable.

In 1884 23,263 acres, or nearly a seventh of the whole, were under cultivation and 3228 under wood. The rotation of crops most commonly followed is a six-course shift of (1) turnips, (2) barley or oats, (3), (4), (5) grass or pasture, and (6) oats. Horses in 1884 numbered 580, cattle 2657, sheep 165,061. Till about a century ago the upper farms of the county were stocked exclusively with sheep of the blackfaced breed, and in high heathery tracts these still predominate. But as altitude diminishes sheep improve in quality, from pure Cheviot to half-bred and three-quarters-bred Leicester-Cheviot. Upwards of 60,000 acres, more than a third of the county, belong to the duke of Buccleuch, whose title is derived from an ancient possession of his family in the vale of Rankleburn. Other principal landowners are Mr Maxwell-Stuart of Traquair (9765 acres) and Lord Napier and Ettrick (6988 acres).

Manufactures.—So early as the beginning of the 17th century

the village of Galashiels did a considerable local trade in woollen cloth, then or shortly afterwards known as “Galashiels grey,” and towards the end of the 18th century this industry was greatly stimulated by judicious grants from “the equivalent” paid by England at the Union. About the end of the first quarter of the 19th century a few novelties in pattern (mostly accidental) led to the opening up of what has now become a vast industry—the Tweed trade, which still has its acknowledged centre in Selkirk.

Administration and Population.—Selkirkshire with Peeblesshire forms one parliamentary constituency. Of entire civil parishes it contains only two, with parts of nine others; there are also, taken from these, three *quoad sacra* parishes and part of a fourth. The population, 4937 in 1755 and 9809 in 1851, was in 1881 returned at 25,564,—an increase partly due to the annexation of a portion of Galashiels formerly reckoned in Roxburgh. Outside the two towns of Galashiels (population 9140 in 1881) and Selkirk population has been almost stationary for more than a century, that of the landward parishes in 1755 and 1881 being respectively as follows:—Ashkirk, 200 and 138; Innerleithen, 60 and 61; Ettrick, 397 and 397; Stow, 280 and 441; Yarrow, 1180 and 611; Robertson, 250 and 250.

Antiquities and History.—The shire is not rich in antiquities, although its hillsides here and there reveal earthen enclosures known as “British camps,” as well as tumuli yielding human remains and the usual fragments of rude pottery. A mysterious ditch, known as “the Catrail,” beginning at the north end of the county, traverses its entire extent before entering Roxburgh on its way to the English border. Besides smaller redoubts, there is on its line, at Rink in Galashiels parish, a well-preserved circular fort of formidable strength and dimensions. Near Minchmoor the Catrail is crossed by “Wallace's trench,” where, according to an historical document recently published, the Scottish patriot defied for a while the generals of Edward I. Close by is the hill-track by which Montrose escaped from the disastrous field of Philiphaugh in 1645. Newark Castle, built by James II., still stands in fair preservation, notable enough historically, but more familiar as the recital-hall of the “last minstrel's” immortal lay. The county is dotted over with other towers of smaller size, in various stages of decay. Around them cluster those traditions which, sung in ballads full of simple force and tenderness, have made Selkirk the poet's chosen haunt. Yarrow, “garlanded with rhyme,” has, without hyperbole, been termed “the Tempe of the West.” Selkirk was long known officially as the “shire of the Forest,” an appellation its famous sheriff Sir Walter Scott loved to recall. Except the burgh of Selkirk, its lands, and a large tract in upper Ettrick belonging to Melrose Abbey, the county remained long under the jurisdiction of a forest court, and its forest-steadings were held by tack from the crown till the time of Queen Mary. It was a favourite hunting-ground of Scottish monarchs and formed the dowry-land of at least two foreign princesses who became queens of Scotland.

See T. Craig-Brown, *Hist. of Selkirkshire*.

SELKIRK, the county town of Selkirkshire, is on the river Ettrick, between its absorption of the Yarrow and its junction with the Tweed, and is connected by a branch railway with the Waverley line from Scotland to England. Although almost entirely a manufacturing town, having several large mills for woollen cloth and yarn, it is not without importance as the centre of an extensive pastoral area. The county offices and prison excepted, the public buildings of Selkirk are not striking. The population of the burgh was 1053 in 1735, 1800 in 1831, and 6090 in 1881.

From the charter by which David I., while prince of Northumbria, established in Selkirk the Benedictine abbey afterwards removed to Kelso, it appears that even at that remote period (1119-24) it was an old town and the prince's residence. David's castle continued to be a frequent resort of his successors on the throne, particularly of William the Lion, many of whose charters were signed “in plena curia apud Selchircham.” Enlarged and strengthened by Edward I., the fortress was captured by the patriotic party soon after Wallace's return from France. Nothing now remains of it but green mounds and the name “Peel Hill.” It is significant of the destruction wrought by repeated conquests and reconquests that Selkirk, notwithstanding its antiquity and early importance, boasts not one building a century and a half old. As its early name (Scheleschyrche) implies, it was originally a collection of forest “shiels” beside which an early church was planted, probably by the Culdees of Old Melrose. Clear light is thrown upon the manners and customs of old border towns by the ancient records of this burgh, still extant (with gaps) from 1503. A minute of 1513 mentions the steps taken to comply with the king's letter ordering the levy before Flodden, where, according to tradition, the burgesses of Selkirk fought with stubborn valour. James V. granted the community right to enclose 1000 acres from the common and gave them leave to elect a provost, the first to fill that office being slain

in defence of the burgh lands. From an early period shoemakers were a numerous craft in Selkirk, and in 1715 and 1745 they were forced to furnish several thousand pairs of shoes to the Jacobite armies. "Souters of Selkirk" is still a synonym for the inhabitants.

SELKIRK, or SELCRAIG, ALEXANDER (1676-1723), a sailor who is supposed to have been the prototype of Defoe's "Robinson Crusoe," was the son of a shoemaker and tanner in Largo, Fifeshire, and was born in 1676. In his youth he displayed a quarrelsome and unruly disposition, and, having been summoned on 27th August 1695 before the kirk-session for his indecent behaviour in church, "did not compare, being gone away to the seas." At an early period he was engaged in buccaneer expeditions to the South Seas, and in 1703 joined the "Cinque Ports" galley as sailing master. The following year he had a dispute with the captain, and at his own request was in October put ashore on the island of Juan Fernandez, where, after a solitary residence of four years and four months, he was taken off by Captain Woods Rogers, commander of a privateer, who made him his mate and afterwards gave him the independent command of one of his prizes. He returned home in 1712; but in 1717 he eloped with a country girl and again went to sea. He died in 1723 while lieutenant on board the royal ship "Weymouth."

See Howell, *Life and Adventures of Alexander Selkirk*, 1829.

SELMA, a city of the United States, in Dallas county, Alabama, at the head of steamboat navigation of the Alabama river, occupies a plateau on the bluff of the right bank, 95 miles below Montgomery. It has cotton warehouses, railroad machine-shops, and various factories. The population was 6484 (3660 coloured) in 1870 and 7529 (4184 coloured) in 1880. Selma, which was strongly fortified during the Civil War and the seat of a Confederate arsenal (where 1800 men were employed), was captured by the Federal major-general J. H. Wilson on 2d April 1865.

SEMPALATINSK, an extensive province (*oblast*) of the Russian dominions in Central Asia; administratively it forms a part of the general-governorship of the Steppes, although its northern portions really belong to the Irtysh plains of West Siberia. It has an area of 188,300 square miles, and is bounded on the N. by Tobolsk and Tomsk, on the S.E. by China, on the S. by Semirychensk, and on the W. by Akmolinsk. As regards configuration, it differs widely in its northern and southern parts. The snowclad ridges (9000 to 10,000 feet) of the great Altai and Naryn enter its south-eastern portion, stretching southwards to Lake Zaisan. Another complex of mountains, Kandygatai and Kaibinsk, rising to 5000 and 6000 feet above the sea, continues them towards the west; a broad valley intervenes, through which the Irtysh finds its way from the Zaisan terrace to the lowlands of Siberia. Many extensions of these mountains and subordinate ridges stretch towards the north. The still lower but wild Jinghiz-tau mountains fill the south-western part of Semipalatinsk, sending out their rocky spurs into the steppe region. In the south, the Tarbagatai (Marmots') range (9000 to 10,000 feet) separates Semipalatinsk from Semirychensk and the Chinese province of Jugutchak. Wide steppes fill up the spaces between the mountains: such are the Zaisan steppe (1200 to 1500 feet), between the Tarbagatai and the Altai ranges; the plains of Lake Balkash, some 300 feet lower, to the south of the Jinghiz-tau; and the plains of the Irtysh, which hardly rise 600 feet above the sea. All kinds of crystalline rocks—granites, syenites, diorites, and porphyries, as also crystalline slates of all descriptions—are met with in the mountain tracts, which contain also rich gold-bearing sands, silver and lead mines, graphite, coal, and the less valuable precious stones. The geology of the region and even its

topography are still but imperfectly known. Numerous boulders widely scattered around the mountains testify to a much wider extension of glaciers in former times. The chief river of the province, the Irtysh, which issues from Lake Zaisan, flows north and north-west and waters Semipalatinsk for more than 760 miles. Between Bukhtarma and Ust-Kamenogorsk it crosses the Altai by a wild gorge, with dangerous rapids, through which, however, boats are floated. Lake Zaisan, 80 miles long and from 10 to 20 wide, has depth sufficient for steamboat navigation; steamers traverse also for some 100 miles the lower course of the Black Irtysh, which flows from Kuldja to Lake Zaisan. The Kurtchum, the Naryn, and the Bukhtarma are the chief right-hand tributaries of the Irtysh, while the Bukoñ, the Kizil-su, and many smaller ones join it from the left; none are navigable, neither are the Kokbekty and Bugaz, which enter Lake Zaisan on the west. Lake Balkash, which borders Semipalatinsk in the south-west, formerly received several tributaries from the Jinghiz-tau. Many smaller lakes (some of them merely temporary) occur on the Irtysh plain, and yield salt. The whole of the country is rapidly drying up. The climate is severe. The average yearly temperature reaches 43° in the south and 34° in the north; the winter is very cold, and frosts of -44° Fahr. are not uncommon, while heats raising the thermometer to 122° in the shade are experienced in the summer. The yearly amount of rain and snow is trifling, although snowstorms are very common; strong winds prevail. Forests are plentiful in the hilly districts and on the Irtysh plain, the flora being Siberian in the north and more Central Asiatic towards Lakes Balkash and Zaisan.

The chief inhabitants are Kirghiz-kazaks, who acknowledged the supremacy of Russia in 1732 and may number now (1886) nearly half a million (479,750 in 1876, of whom 10,950 were settled in towns). The Russian population, which in the same year amounted to nearly 50,000 Cossacks and peasants, has slowly increased since. The aggregate population was in 1882 estimated at 538,400, of whom 34,550 lived in towns. The Russians are chiefly agriculturists, and have wealthy settlements on the right bank of the Irtysh, as well as a few patches in the south, at the foot of the mountains. The Kirghizes are almost exclusively cattle-breeders and keep large flocks of sheep, horses, and horned cattle, as also camels. Hunting and fishing (in Lake Zaisan) are favourite and profitable occupations with the Cossacks and the Kirghizes. Industries are of course insignificant, except that of mining,—gold being obtained within the province to the amount of from 300 to 400 lb every year; the extraction of silver and lead is very limited. Trade is of some importance, and is increasing,—Russian manufactured articles being exchanged for the raw produce (hides, tallow, cattle) of the region. The province is divided into four districts, the chief towns of which are Semipalatinsk (17,820 inhabitants in 1881), Pavlodar (2260), Kokbekty (3680), and Karkaralinsk (2030). All these towns, lost amidst the sandy steppes, are mere administrative centres. Bukhtarma and Ust-Kamenogorsk (3400), among the mountains, are also worthy of mention.

SEMPALATINSK, capital of the above province, is situated on the right bank of the Irtysh, on the highway from Central Asia to northern Europe. At the end of the 18th century it began to be a centre for trade, reaching its greatest development in 1850-60. Kazan and Turkestan Tatars formed the bulk of its population. The town still remains, however, a collection of old wooden houses scattered among unfenced spaces of sand. The Tatar town has a somewhat better aspect than the Russian. The inhabitants (17,820 in 1881) consist of officials, merchants, and agriculturists.

SEMPALATINSK. According to the legend which the Greeks received from Ctesias, and which is most fully preserved by Diodorus (book ii.) in a form that, according to the researches of C. Jacoby (*Rhein. Museum*, 1875, p. 555 sq.), is not taken direct from Ctesias but comes through Clitarchus, and has been modified by traits borrowed from the history of Alexander the Great, the Assyrian empire over all Asia as far as the borders of India was created by

Ninus, the founder of Nineveh, and his greater spouse Semiramis, who was first the wife of his captain, Onnes, but won the king's love by an heroic exploit, the capture of Bactra, which had defied the royal forces. Ninus died, and Semiramis, succeeding to his power, traversed all parts of the empire, erecting great cities (especially Babylon) and stupendous monuments or opening roads through savage mountains. She was unsuccessful only in an attack on India. At length, after a reign of forty-two years, she delivered up the kingdom to her son Ninyas and disappeared, or, according to what seems to be the original form of the story, was turned into a dove and was thenceforth worshipped as a deity. This legend is certainly not Assyrian or Babylonian; Ctesias must have had it from Persians or Medes, and the fulness of detail, the multitude of proper names, favour the conjecture that Ninus and Semiramis were celebrated in some Median epic tale which went on to tell of the fall of Assyria before the Medes (Duncker, *Gesch. d. Alt.*, 5th ed., ii. 18 sq.). In this legend all the conquests of Assyria were crowded together into one lifetime, and King Ninus and his son Ninyas are mere eponyms of Nineveh, personifications of the Assyrian monarchy. But it is round the figure of Semiramis that all the real interest of the legend gathers; nor can she be the arbitrary creation of a poet, for it is certain that her name was popularly connected with many famous places and monuments. "The works of Semiramis," says Strabo (xvi. 1, 2), "are pointed out through almost the whole continent, earthworks bearing her name, walls and strongholds, aqueducts, and stair-like roads over mountains, canals, roads, and bridges." Ultimately every stupendous work of antiquity by the Euphrates or in Iran seems to have been ascribed to her,—even the Behistun inscriptions of Darius (Diod., ii. 13). Of this we already have evidence in Herodotus, who, though he does not know the legend afterwards told by Ctesias, ascribes to her the banks that confined the Euphrates (i. 184) and knows her name as borne by a gate of Babylon (iii. 155). Various places in Media bore the name of Semiramis, but slightly changed, even in the Middle Ages (Hoffmann, *Syrische Akten*, p. 137), and the old name of Van was Shamiramagerd, Armenian tradition regarding her as its founder (St Martin, *Mém. sur l'Arménie*, i. 138). These facts are to be explained by observing that in her birth as well as in her disappearance from earth Semiramis clearly appears not as a mere woman but as a great goddess. In Diodorus's account she is the daughter of the Derceto of Ascalon and miraculously brought up by doves, and again she is finally transformed into a dove, and therefore the Assyrians pay divine honours to this bird. Semiramis, therefore, is a dove-goddess associated with Derceto the fish-goddess. The same association of the fish and dove goddesses appears at Hierapolis (Bambyce, Mabbug), the great temple at which according to one legend was founded by Semiramis (*De Dea Syria*, 14), and where her statue was shown with a golden dove on her head (*ibid.*, 33, comp. 39).¹ But the Semitic dove-goddess is Ishtar or Astarte, the great goddess of Assyria and Babylon, and the irresistible charms of Semiramis, her sexual excesses (see especially Dinon in *Ælian*, *V. H.*, vii. 1), and other features of the legend all bear out the view that she is primarily a form of Astarte, and so fittingly conceived as the great queen of Assyria. The word Semiramis in Semitic form, as the Syrians write it, is Shēmīrām (Hoffmann, *ut supra*), an epithet rather than a proper name, which may be rendered "the highly celebrated," or perhaps rather "name [manifestation] of [the god] Rām."² The historical inference

¹ It is noteworthy in this connexion that Mabbug is the *Ninus vetus* of Ammianus and Philostratus.

² Cp. the Phœnician "Astarte שֶׁמֶרַם" (*C. I. S.*, i. 1, No. 3, 1. 18).

from all this is that Semitic worship was carried by the Assyrians far into Media and Armenia.

On an Assyrian inscription the name Sammuramat appears as borne by the "lady of the palace" of Rammannivar (812-783 B.C.); see Schrader, *K. A. T.*, 2d ed., p. 366. E. Meyer (*Gesch. des Alterth.*, p. 409) combines this with the statement of Herodotus that Semiramis lived five generations before Nitocris, which would make her date 766 B.C. Possibly Herodotus identified the two names, but it is very doubtful whether they are really connected. Shemiramoth (1 Chron. xv. 18) perhaps means "statues of Semiramis," and, if so, was originally a place-name (Ewald, *a. l.*).

SEMI-RYETCHENSK, a province of Russian Turkestan, including the steppes south of Lake Balkash and parts of the Tian-Shan Mountains around Lake Issik-kul. It has an area of 155,300 square miles and is bounded by Semipalatinsk on the N., by China (Jugutchak, Kuldja, Aksu, and Kashgaria) on the E. and S., and by the Russian provinces of Ferganah, Syr-Daria, and Akmolinsk on the W. It owes its name (*Jity-su*, *Semi-ryetchie*, i.e., "Seven Rivers") to the rivers which flow from the south-east into Lake Balkash. The Jungarian Ala-tau, which separates it from north-western Kuldja, penetrates into its central portions, extending south-west towards the river Ili, with an average height of 6000 feet above the sea, several isolated snow-clad peaks reaching about 12,000 feet. In the south Semiryetchensk embraces the intricate systems of the Trans-Ili Ala-tau and the Tian-Shan (see TURKESTAN). Two ranges of the former, connected about their middle by a single mountain-mass, extend east-north-eastwards along the northern shore of Lake Issik-kul, both ranging from 10,000 to about 15,000 feet and both partially snow-clad. To the south of the lake two immense ranges of the Tian-Shan, separated by the valley of the Naryn, stretch in the same direction, raising their icy peaks to above 15,000 and 16,000 feet; while westwards from the lake the vast walls of the Alexandrovskiy ridge, 9000 to 10,000 feet high, with peaks rising some 2000 feet higher, extend to the province of Syr-Daria. Another mountain complex of much lower elevation runs north-westwards from the Trans-Ili Ala-tau towards the southern extremity of Lake Balkash. In the north, where the province borders Semipalatinsk, it includes the western parts of the Tarbagatai range, the summits of which (10,000 feet) do not reach the limit of perpetual snow. The remainder of the province consists of a rich steppe in the north-east (Serghiopol), and vast uninhabitable sand-steppes on the south-east of Lake Balkash. Southwards from the last-named, however, at the foot of the mountains and at the entrance to the valleys, there are rich areas of fertile land, which are rapidly being colonized by Russian immigrants, who have also spread into the Tian-Shan, to the east of Lake Issik-kul. The climate is relatively temperate (average yearly temperature 44° Fahr. at Vyernyi, 2500 feet above the sea) and the vegetation rich.

The chief river is the Ili, which enters the province from Kuldja, makes its way through the spurs of the Trans-Ili Ala-tau, flows north-west in a bed varying from 200 to 1000 yards in width, and waters the province for 250 miles before it enters Lake Balkash by several mouths forming a wide delta. Its tributaries from the left are the Naryn, the Tchilik, and the Kurtu; several others become lost in the sands. The Karatal, the Aksu, and the Lepsa likewise fall into Lake Balkash. The Tchu rises in the Tian-Shan Mountains and flows north-westwards to Lake Saumal-kul; and the Naryn flows south-westwards along a longitudinal valley of the Tian-Shan, and enters Ferganah to join the Syr-Daria. The province contains several important lakes. Lake Balkash, or Dzhiz, in the north (8880 square miles), is crescent-shaped, 400 miles long and 55 wide in its broader part; but its area is much less than it formerly was, and it is rapidly drying up,—notably since 1853. Lake Ala-kul, which was connected with Balkash in the Post-Pliocene period, now stands some hundred feet higher, and is connected by a chain of smaller lakes with Sisik-kul. Lake Issik-kul (2260 square miles) is a deep mountain lake, 120 miles long and 37 wide, 5300 feet above the sea. The alpine lakes Son-kul (9400 feet) and Tchatyr-kul (11,100) lie south-west of Issik-kul.

The population, which was estimated at 748,800 by M. Kostenko in 1880 (189,660 being in the Kuldja region), has since increased,

the latest official figures (1882) giving 685,950 for the province, exclusive of the Kuldja region. Of these Russians numbered, according to Kostenko, 44,585, 20,640 being Cossacks, who are very poor as compared with the free Russian emigrants. The majority of the population are Kirghiz (595,237); next come Tarantchis (36,265), Kalmucks (about 25,000), Mongols and Manchurians (22,000), and Dungsans (19,657), these last two mostly in Kuldja; while Tatars and Sarts are each represented by some 3000 or 3500 (all the foregoing figures include those for Kuldja). The

province is subdivided into five districts; Vyernyi (18,423 inhabitants in 1879, of whom 3586 were military), the chief town of the province, formerly Almaty, is situated at the foot of the Trans-Iliian Ala-tau, and has a mixed population of Russians, Tatars, Sarts, Kirghiz, Kalmucks, and Jews; its trade with Kuldja and Kashgar is increasing rapidly, and it has now two lyceums, for boys and girls, and several other schools. The other towns—Kopal (5450 inhabitants), Serghipol (1045), Tokmak (1770), and Karakol (2780)—are merely administrative centres.

SEMITIC LANGUAGES

THE name "Semitic languages" is used to designate a group of Asiatic and African languages, some living and some dead, namely, Hebrew and Phœnician, Aramaic, Assyrian, Arabic, Ethiopic (Geez and Amharic). The name, which was introduced by Eichhorn,¹ is derived from the fact that most nations which speak or spoke these languages are descended, according to Genesis, from Shem, son of Noah. But the classification of nations in Genesis x. is founded neither upon linguistic nor upon ethnographical principles: it is determined rather by geographical and political considerations. For this reason Elam and Lud are also included among the children of Shem; but neither the Elamites (in Susiana) nor the Lydians appear to have spoken a language connected with Hebrew. On the other hand, the Phœnicians (Canaanites), whose dialect closely resembled that of Israel, are not counted as children of Shem. Moreover, the compiler of the list in Genesis x. had no clear conceptions about the peoples of south Arabia and Ethiopia. Nevertheless it would be undesirable to give up the universally received terms "Semites" and "Semitic." There exist large groups of languages and peoples which bear no natural collective appellations, because the peoples grew up unconscious of their mutual relationship; so science must needs give them artificial designations, and it would be well if all such terms were as short and precise as "Semitic."

Mutual
con-
nexion.

The connexion of the Semitic languages with one another is somewhat close, in any case closer than that of the Indo-European languages. The more ancient Semitic tongues differ from one another scarcely more than do the various Teutonic dialects. Hence even in the 17th century such learned Orientalists as Hottinger, Bochart, Castell, and Ludolf had a tolerably clear notion of the relationship between the different Semitic languages with which they were acquainted; indeed the same may be said of some Jewish scholars who lived many centuries earlier, as, for instance, Jehuda ben Koraish. It is not difficult to point out a series of characteristic marks common to these languages,—the predominance of triconsonantal roots, or of roots formed after the analogy of such, similarity in the formation of nominal and verbal stems, a great resemblance in the forms of the personal pronouns and in their use for the purpose of verbal inflexion, the two principal tenses, the importance attached to the change of vowels in the interior of words, and lastly considerable agreement with regard to order and the construction of sentences. Yet even so ancient a Semitic language as the Assyrian appears to lack some of these features, and in certain modern dialects, such as New Syriac, Mahri, and more particularly Amharic, many of the characteristics of older Semitic speech have disappeared. But the resemblance in vocabulary generally diminishes in proportion to the modernness of the dialects. Still we can trace the connexion between the modern and the ancient dialects, and show, at least approximately, how the former were developed out of the latter. Where a development of this kind can be proved to have taken place, there a relationship must

exist, however much the individual features may have been effaced. The question here is not of logical categories but of organic groups.

All these languages are descendants of a primitive Semitic stock which has long been extinct. Many of its most important features may be reconstructed with at least tolerable certainty, but we must beware of attempting too much in this respect. When the various cognate languages of a group diverge in essential points, it is by no means always possible to determine which of them has retained the more primitive form. The history of the development of these tongues during the period anterior to the documents which we possess is often extremely obscure in its details. Even when several Semitic languages agree in important points of grammar we cannot always be sure that in these particulars we have what is primitive, since in many cases analogous changes have taken place independently. To one who should assert the complete reconstruction of the primitive Semitic language to be possible, we might put the question, Would the man who is best acquainted with all the Romance languages be in a position to reconstruct their common mother, Latin, if the knowledge of it were lost? And yet there are but few Semitic languages which we can know as accurately as the Romance languages are known. As far as the vocabulary is concerned, we may indeed maintain with certainty that a considerable number of words which have in various Semitic languages the form proper to each were a part of primitive Semitic speech. Nevertheless even then we are apt to be misled by independent but analogous formations and by words borrowed at a very remote period.² Each Semitic language or group of languages has, however, many words which we cannot point out in the others. Of such words a great number no doubt belonged to primitive Semitic speech, and either disappeared in some of these languages or else remained in use, but not so as to be recognizable by us. Yet many isolated words and roots may in very early times have been borrowed by the Hebrew, the Aramaic, the Ethiopic, &c., perhaps from wholly different languages, of which no trace is left.

The question which of the known Semitic dialects most resembles the primitive Semitic language is less important than one might at first suppose, since the question is one not of absolute but only of relative priority. After scholars had given up the notion (which, however, was not the fruit of scientific research) that all Semitic languages, and indeed all the languages in the world, were descendants of Hebrew or of Aramaic, it was long the fashion to maintain that Arabic bore a close resemblance to the primitive Semitic language.³ But, just as it is now recognized with ever-increasing clearness that Sanskrit is far from having retained in such a degree as was even lately supposed the characteristics of primitive Indo-European

² The more alike two languages are the more difficult it usually is to detect, as borrowed elements, those words which have passed from one language into the other.

³ This theory is carried to its extreme limit in Olshausen's very valuable *Hebrew Grammar* (Brunswick, 1861).

¹ *Einleitung in das A. T.*, 2d ed., i. 45 (Leipsic, 1787).

speech, so in the domain of the Semitic tongues we can assign to Arabic only a relative antiquity. It is true that in Arabic very many features are preserved more faithfully than in the cognate languages,—for instance, nearly all the original abundance of consonants, the short vowels in open syllables, particularly in the interior of words, and many grammatical distinctions which in the other languages are more or less obscured. But, on the other hand, Arabic has coined, simply from analogy, a great number of forms which, owing to their extreme simplicity, seem at the first glance to be primitive, but which nevertheless are only modifications of the primitive forms; whilst perhaps the other Semitic languages exhibit modifications of a different kind. In spite of its great wealth, Arabic is characterized by a certain monotony, which can scarcely have existed from the beginning. Both Hebrew and Aramaic are in many respects more ancient than Arabic. This would no doubt be far more apparent if we knew Hebrew more completely and according to the original pronunciation of its vowels, and if we could discover how Aramaic was pronounced about the 13th century before our era. It must always be borne in mind that we are far more fully and accurately acquainted with Arabic than with the other Semitic languages of antiquity. The opinion sometimes maintained by certain over-zealous Assyriologists, that Assyrian is the “Sanskrit of the Semitic world,” has not met with the approval even of the Assyriologists themselves, and is unworthy of a serious refutation.

A comparative grammar of the Semitic languages must of course be based upon Arabic, but must in every matter of detail take into consideration all the cognate languages, as far as they are known to us. In the reconstruction of the primitive Semitic tongue Hebrew might perhaps afford more assistance than Ethiopic; but Aramaic, Assyrian, and even the less known and the more modern dialects might furnish valuable materials.

It is not a formidable undertaking to describe in general terms the character of the Semitic mind, as has been done, for example, by Lassen (*Indische Alterthumskunde*, i. 414 sq.) and by Renan in the introduction to his *Histoire des Langues Sémitiques*. But still there is a danger of assuming that the most important characteristics of particular Semitic peoples, especially of the Israelites and of the Arabs, are common to all Semites, and of ascribing to the influence of race certain striking features which are the result of the external conditions of life, and which, under similar circumstances, are also developed among non-Semitic races. And, though it is said, not without reason, that the Semites possess but little talent for political and military organization on a large scale, yet we have in the Phœnicians, especially the Carthaginians, in Hamilcar and in Hannibal, a proof that under altered conditions the Semites are not incapable of distinguishing themselves in these domains. It is a poor evasion to deny that the Phœnicians are genuine Semites, since even our scanty sources of information suffice to show that in the matter of religion, which among Semites is of such supreme importance, they bore a close resemblance to the ancient Hebrews and Aramæans. In general descriptions of this kind it is easy to go too far. But to give in general terms a correct idea of the Semitic languages is a task of very much greater difficulty. Renan's brilliant and most interesting sketch is in many respects open to serious criticism. He cites, for example, as characteristic of the Semitic tongues, that they still retain the practice of expressing psychological processes by means of distinct imagery. In saying this he is taking scarcely any language but Hebrew into account. But the feature to which he here alludes is owing to the particular stage of intellectual development that had been reached by the Israelites, is in part peculiar to the poetical

style, and is to be found in like manner among wholly different races. That the Semitic languages are far from possessing the fixity which Renan attributes to them we shall see below. But, however this may be, certain grammatical peculiarities of the Semitic languages—above all, the predominance of trilateral roots—are so marked that it is scarcely possible to doubt whether any language with which we are tolerably well acquainted is or is not Semitic. Only when a Semitic language has been strongly influenced not only in vocabulary but also in grammar by some non-Semitic speech, as is the case with Amharic, can such a doubt be for a moment entertained.

Many attempts have been made, sometimes in a very superficial fashion and sometimes by the use of scientific methods, to establish a relationship between the Semitic languages and the Indo-European. It was very natural to suppose that the tongues of the two races which, with the single exceptions of the Egyptians and the Chinese, have formed and moulded human civilization, who have been near neighbours from the earliest times, and who, moreover, seem to bear a great physical resemblance to one another can be nothing else than two descendants of the same parent speech. But all these endeavours have wholly failed. It is indeed probable that the languages, not only of the Semites and of the Indo-Europeans, but also those of other races, are derived from the same stock, but the separation must have taken place at so remote a period that the changes which these languages underwent in prehistoric times have completely effaced what features they possessed in common; if such features have sometimes been preserved, they are no longer recognizable. It must be remembered that it is only in exceptionally favourable circumstances that cognate languages are so preserved during long periods as to render it possible for scientific analysis to prove their relationship with one another.¹

On the other hand, the Semitic languages bear so striking a resemblance in some respects to certain languages of northern Africa that we are forced to assume the existence of a tolerably close relationship between the two groups. We allude to the family of languages known in modern times as the “Hamitic,” and composed of the Egyptian, Berber, Beja (Bishâri, &c.), and a number of tongues spoken in Abyssinia and the neighbouring countries (Agaw, Galla, Dankali, &c.). It is remarkable that some of the most indispensable words in the Semitic vocabulary (as, for instance, “water,” “mouth,” and certain numerals) are found in Hamitic also, and that these words happen to be such as cannot well be derived from trilateral Semitic roots, and are more or less independent of the ordinary grammatical rules. We notice, too, important resemblances in grammar,—for example, the formation of the feminine by means of a *t* prefixed or affixed, that of the causative by means of *s*, similarity in the suffixes and prefixes of the verbal tenses, and, generally, similarity in the personal pronouns, &c. It must be admitted that there is also much disagreement,—for instance, the widest divergence in the mass of the vocabulary; and this applies to the Semitic languages as compared not only with those Hamitic languages that are gradually becoming known to us at the present day but with the Egyptian, of which we possess documents dating from the fourth millennium before the Christian era. The question is here involved in great difficulties. Some isolated resemblances may, improbable as it appears, have been produced by the bor-

¹ The following is an instance of the manner in which we may be deceived by isolated cases. “Six” is in Hebrew *shesh*, almost exactly like the Sanskrit and modern Persian *shash*, the Latin *sex*, &c. But the Indo-European root is *sweks*, or perhaps even *kseuks*, whereas the Semitic root is *shidh*, so that the resemblance is a purely accidental one, produced by phonetic change.

rowing of words. Uncivilized races, as has been proved with certainty, sometimes borrow from others elements of speech in cases where we should deem such a thing impossible,—for example, numerals and even personal suffixes. But the great resemblances in grammatical formation cannot be reasonably explained as due to borrowing on the part of the Hamites; more especially as these points of agreement are also found in the language of the Berbers, who are scattered over an enormous territory, and whose speech must have acquired its character long before they came into contact with the Semites. We are even now but imperfectly acquainted with the Hamitic languages; it is not yet certain into what groups they fall; and the relation in which Egyptian stands to Berber on the one hand and to the south Hamitic languages on the other requires further elucidation. The attempt to write a comparative grammar of the Semitic and Hamitic languages would be, to say the least, very premature.¹

Original
seat of
Semites. The connexion between the Semitic languages and the Hamitic appears to indicate that the primitive seat of the Semites is to be sought in Africa; for it can scarcely be supposed that the Hamites, amongst whom there are gradual transitions from an almost purely European type to that of the Negroes, are the children of any other land than "the dark continent." There seems, moreover, to be a considerable physical resemblance between the Hamites and the Semites, especially in the case of the southern Arabs; we need mention only the slight development of the calf of the leg, and the sporadic appearance amongst Semites of woolly hair and prominent jaws.² But both Semites and Hamites have been mingled to a large extent with foreign races, which process must have diminished their mutual similarity. All this, however, is offered not as a definite theory but as a modest hypothesis.

It was once the custom to maintain that the Semites came originally from certain districts in Armenia. This supposition was founded on the book of Genesis, according to which several of the Semitic nations are descended from Arphachsad, *i.e.*, the eponym of the district of Arrapachitis, now called Albak, on the borders of Armenia and Kurdistan. It was also thought that this region was inhabited by the primitive race from which both the Semites and the Indo-Europeans derived their origin. But, as we saw above, this ancient relationship is a matter of some doubt; in any case, the separation does not date from a period so recent that the Semites can be supposed to have possessed any historical tradition concerning it. There cannot be a greater mistake than to imagine that nations have been able to preserve during long ages their recollection of the country whence their supposed ancestors are said to have emigrated. The fantastic notion once in vogue as to the permanence of historical memories among uncivilized races must be wholly abandoned. The period in which the Hebrews, the Arabs, and the other Semitic nations together formed a single people is so distant that none of them can possibly have retained any tradition of it. The opinion that the Hebrews and the tribes most closely related to them were descendants of Arphachsad is apparently due to the legend that Noah's ark landed near this district. The notion has therefore a purely mythical origin. Moreover, in Genesis itself we find a totally different account of the matter, derived from another source, which represents all nations, and therefore the Semites among them, as having come from Babylon.

Scarcely any man of science now believes in the northern origin of the Semites.

Others, as Sprenger and Schrader,³ consider the birth-place of the Semitic race to have been in Arabia. There is much that appears to support this theory. History proves that from a very early period tribes from the deserts of Arabia settled on the cultivable lands which border them and adopted a purely agricultural mode of life. Various traces in the language seem to indicate that the Hebrews and the Aramæans were originally nomads, and Arabia with its northern prolongation (the Syrian desert) is the true home of nomadic peoples. The Arabs are also supposed to display the Semitic character in its purest form, and their language is, on the whole, nearer the original Semitic than are the languages of the cognate races. To this last circumstance we should, however, attach little importance. It is by no means always the case that a language is most faithfully preserved in the country where it originated. The Lithuanians speak the most ancient of all living Indo-European languages, and they are certainly not autochthones of Lithuania; the Romance dialect spoken in the south of Sardinia is far more primitive than that spoken at Rome; and of all living Teutonic languages the most ancient is the Icelandic. It is even doubtful whether the ordinary assumption be correct, that the most primitive of modern Arabic dialects are those spoken in Arabia. Besides, we cannot unreservedly admit that the Arabs display the Semitic character in its purest form; it would be more correct to say that, under the influence of a country indescribably monotonous and of a life ever changing yet ever the same, the inhabitants of the Arabian deserts have developed most exclusively certain of the principal traits of the Semitic race. All these considerations are indecisive; but we willingly admit that the theory which regards Arabia as the primitive seat of all Semites is by no means untenable.

Finally, one of the most eminent of contemporary Orientalists, Ignazio Guidi,⁴ has attempted to prove that the home of the Semites is on the lower Euphrates. He contends that the geographical, botanical, and zoological conceptions which are expressed in the various Semitic languages by the same words, preserved from the time of the dispersion, correspond to the natural characteristics of no country but the above-mentioned. Great as are the ingenuity and the caution which he displays, it is difficult to accept his conclusions. Several terms might be mentioned which are part of the common heritage of the northern and the southern Semites, but which can scarcely have been formed in the region of the Euphrates. Moreover, the vocabulary of most Semitic languages is but very imperfectly known, and each dialect has lost many primitive words in the course of time. It is therefore very unsafe to draw conclusions from the fact that the various Semitic tongues have no one common designation for many important local conceptions, such as "mountain." The ordinary words for "man," "old man," "boy," "tent," are quite different in the various Semitic languages, and yet all these are ideas for which the primitive Semites must have had names.

We must therefore for the present confess our inability to make any positive statement with regard to the primitive seat of the original Semitic race.

It is not very easy to settle what is the precise connexion between the various Semitic languages, considered individually. In this matter one may easily be led to hasty conclusions by isolated peculiarities in vocabulary or
 nexions
 between
 the Sem-
 itic lan-
 guages.

¹ This of course applies yet more strongly to Benfey's work, *Ueber das Verhältniss der ägyptischen Sprache zum semitischen Sprachstamm* (Leipzig, 1844); but his book has the permanent merit of having for the first time examined this relationship in a scientific manner.

² Comp. G. Gerland, *Atlas der Ethnographie* (Leipzig, 1876), p. 40 of the text.

³ The former has maintained this view in several of his works, the latter in *Z.D.M.G.*, xxvii. 417 sq.

⁴ "Della Sede Primitiva dei Popoli Semitici," in the *Proceedings of the Accademia dei Lincei*, 1878-79.

grammar. Each of the older Semitic languages occasionally agrees in grammatical points with some other to which in most respects it bears no very close resemblance, while dialects much more nearly related to it are found to exhibit different formations. Each Semitic tongue also possesses features peculiar to itself. For instance, the Hebrew-Phœnician group and the Arabic have a prefixed definite article (the etymological identity of which is, however, not quite certain); the dialect nearest to Arabic, the Sabæan, expresses the article by means of a suffixed *n*; the Aramaic, which in general more closely resembles Hebrew than does the Arabic group, expresses it by means of a suffixed *ā*; whereas the Assyrian in the north and the Ethiopic in the south have no article at all. Of this termination *n* for the definite article there is no trace in either Arabic or Hebrew; the Sabæan, the Ethiopic, and the Aramaic employ it to give emphasis to demonstrative pronouns; and the very same usage has been detected in a single Phœnician inscription.¹ In this case, therefore, Hebrew and Arabic have, independently of one another, lost something which the languages most nearly related to them have preserved. In like manner, the strengthening of the pronoun of the third person by means of *t* (or *tū*) is only found in Ethiopic, Sabæan, and Phœnician. Aramaic alone has no certain trace of the reflexive conjugation formed with prefixed *n*; Hebrew alone has no certain trace of the causative with *sha*.² In several of the Semitic languages we can see how the formation of the passive by means of internal vocal change (as *kullima*, "he was addressed," as distinguished from *kallama*, "he addressed") gradually dropped out of use; in Ethiopic this process was already complete when the language first became literary; but in Aramaic it was not wholly so. In a few cases phonetic resemblances have been the result of later growth. For example, the termination of the plural masculine of nouns is in Hebrew *īm*, in Aramaic *īm*, as in Arabic. But we know that Aramaic also originally had *m*, whereas the ancient Arabic forms have after the *n* an *a*, which appears to have been originally a long *ā* (*ūna*, *īna*); in this latter position (that is, between two vowels) the change of *m* into *n* is very improbable. These two similar terminations were therefore originally distinct. We must indeed be very cautious in drawing conclusions from points of agreement between the vocabularies of the various Semitic tongues. The Ethiopians and the Hebrews have the same word for many objects which the other Semites call by other names,—for instance, "stone," "tree," "enemy," "enter," "go out"; and the same may be said of Hebrew as compared with Sabæan. But to build theories upon such facts would be unsafe, since the words cited are either found, though with some change of meaning, in at least one of the cognate languages, or actually occur, perhaps quite exceptionally and in archaic writings, with the same signification. The sedentary habits of the Ethiopians and the Sabæans may possibly have rendered it easier for them to retain in their vocabulary certain words which were used by the civilized Semites of the north, but which became obsolete amongst the Arabian nomads. To the same cause we may attribute the fact that in religion the Sabæans resemble the northern Semites more closely than do the tribes of central Arabia; but these considerations prove nothing in favour of a nearer linguistic affinity.

One thing at least is certain, that Arabic (with Sabæan) and Ethiopic stand in a comparatively close relationship to one another, and compose a group by themselves, as contrasted with the other Semitic languages, Hebrew-Phœnician, Aramaic, and Assyrian, which constitute the

northern group. Only in these southern dialects do we find, and that under forms substantially identical, the important innovation known as the "broken plurals." They agree, moreover, in employing a peculiar development of the verbal root, formed by inserting an *ā* between the first and second radicals (*kātala*, *takātala*), in using the vowel *a* before the third radical in all active perfects—for example, (*h*)*aktala*, *kattala*, instead of the *haktil*, *kattil* of the northern dialects—and in many other grammatical phenomena. This is not at all contradicted by the fact that certain aspirated dentals of Arabic (*th*, *dh*, *ṭh*) are replaced in Ethiopic, as in Hebrew and Assyrian, by pure sibilants—that is, *s* (Hebrew and Assyrian *sh*), *z*, *ṣ*—whereas in Aramaic they are replaced by simple dentals (*t*, *d*, *ṭ*), which seem to come closer to the Arabic sounds. After the separation of the northern and the southern groups, the Semitic languages possessed all these sounds, as the Arabic does, but afterwards simplified them, for the most part, in one direction or the other. Hence there resulted, as it were by chance, occasional similarities. Even in modern Arabic dialects *th*, *dh* have become sometimes *t*, *d*, and sometimes *s*, *z*. Ethiopic, moreover, has kept *ḳ*, the most peculiar of Arabic sounds, distinct from *q*, whereas Aramaic has confounded it with the guttural *ain*, and Hebrew and Assyrian with *q*. It is therefore evident that all these languages once possessed the consonant in question as a distinct one. One sound, *sin*, appears only in Hebrew, in Phœnician, and in the older Aramaic. It must originally have been pronounced very like *sh*, since it is represented in writing by the same character; in later times it was changed into an ordinary *s*. Assyrian does not distinguish it from *sh*.³ The division of the Semitic languages into the northern group and the southern is therefore justified by facts. Even if we were to discover really important grammatical phenomena in which one of the southern dialects agreed with the northern, or *vice versa*, and that in cases where such phenomena could not be regarded either as remnants of primitive Semitic usage or as instances of parallel but independent development, we ought to remember that the division of the two groups was not necessarily a sudden and instantaneous occurrence, that even after the separation intercourse may have been carried on between the various tribes who spoke kindred dialects and were therefore still able to understand one another, and that intermediate dialects may once have existed, perhaps such as were in use amongst tribes who came into contact sometimes with the agricultural population of the north and sometimes with the nomads of the south (see below). All this is purely hypothetical, whereas the division between the northern and the southern Semitic languages is a recognized fact.

Although we cannot deny that there may formerly have existed Semitic languages quite distinct from those with which we are acquainted, yet that such was actually the case cannot be proved. Nor is there any reason to think that the domain of the Semitic languages ever extended very far beyond its present limits. Some time ago many scholars believed that they were once spoken in Asia Minor and even in Europe, but, except in the Phœnician colonies, this notion rested upon no solid proof. It cannot be argued with any great degree of plausibility that even the Cilicians, who from a very early period held constant intercourse with the Syrians and the Phœnicians, spoke a Semitic language.

³ It is not quite certain whether all the Semitic languages originally had the hardest of the gutturals *gh* and *kh* in exactly the same places that they occupy in Arabic. In the case of *kh*—where Ethiopic agrees with Arabic—this is at least probable, since there seem to be traces of it in Assyrian. But it would appear that in Hebrew and Aramaic the distinction between *gh* and *ayin*, between *kh* and *h*, was often different from what it is in Arabic.

¹ Viz., the great inscription of Byblus, *C.I.S.*, fasc. i. No. 1.

² *Shalhebeth*, "flame," is borrowed from Aramaic.

ebrew. *Hebrew.*—Hebrew and Phœnician are but dialects of one and the same language. It is only as the language of the people of Israel that Hebrew can be known with any precision. Since in the Old Testament a few of the neighbouring peoples are represented as being descended from Eber, the eponym of the Hebrews, that is, are regarded as nearly related to the latter, it was natural to suppose that they likewise spoke Hebrew,—a supposition which, at least in the case of the Moabites, has been fully confirmed by the discovery of the Mesha inscription (date, soon after 900 B.C.). The language of this inscription scarcely differs from that of the Old Testament; the only important distinction is the occurrence of a reflexive form (with *t* after the first radical), which appears nowhere else but in Arabic. We may remark in passing that the style of this inscription is quite that of the Old Testament, and enables us to maintain with certainty that a similar historical literature existed amongst the Moabites. But it must be remembered that ancient Semitic inscriptions exhibit, in a sense, nothing but the skeleton of the language, since they do not express the vowels at all, or do so only in certain cases; still less do they indicate other phonetic modifications, such as the doubling of consonants, &c. It is therefore very possible that to the ear the language of Moab seemed to differ considerably from that of the Judæans.

ancient
in-
age.

pronun-
ciation.

The Mesha inscription is the only non-Israelite source from which any knowledge of ancient Hebrew can be obtained. (See HEBREW LANGUAGE AND LITERATURE.) Some fragments in the Old Testament belong to the second millennium before our era,—particularly the song of Deborah (Judges v.), a document which, in spite of its many obscurities in matters of detail, throws much light on the condition of the Israelites at the time when the Canaanites were still contending with them for the possession of the country. The first rise of an historical literature may very probably date from before the establishment of the monarchy. Various portions of the Old Testament belong to the time of the earlier kings; but it was under the later kings that a great part of extant Hebrew literature came into shape. To this age also belong the Siloam inscription and a few seals and gems bearing the names of Israelites. The Hebrew language is thus known to us from a very ancient period. But we are far from being acquainted with its real phonetic condition in the time of David or Isaiah. For, much as we owe to the labours of the later Jewish schools, which with infinite care fixed the pronunciation of the sacred text by adding vowels and other signs, it is evident that even at the best they could only represent the pronunciation of the language in its latest stage, not that of very early ages. Besides, their object was not to exhibit Hebrew simply as it was, but to show how it should be read in the solemn chant of the synagogue. Accordingly, the pronunciation of the older period may have differed considerably from that represented by the punctuation. Such differences are now and then indicated by the customary spelling of the ancient texts,¹ and sometimes the orthography is directly at variance with the punctuation.² In a few rare cases we may derive help from the somewhat older tradition contained in the representation of Hebrew words and proper names by Greek letters, especially in the ancient Alexandrine translation of the Bible (the so-called Septuagint). It is of particular importance to remark that this older tradition still retains an original *α* in many cases where the

punctuation has the later *i* or *e*. We have examined this point somewhat in detail, in order to contradict the false but ever-recurring notion that the ordinary text of the Bible represents without any essential modification the pronunciation of ancient Hebrew, whereas in reality it expresses (in a very instructive and careful manner, it is true) only its latest development, and that for the purpose of solemn public recitation. A clear trace of dialectal differences within Israel is found in Judges xii. 6, which shows that the ancient Ephraimites pronounced *s* instead of *sh*.

The destruction of the Judæan kingdom dealt a heavy blow to the Hebrew language. But it is going too far to suppose that it was altogether banished from ordinary life at the time of the exile, and that Aramaic came into use among all the Jews. In the East even small communities, especially if they form a religious body, often cling persistently to their mother-tongue, though they may be surrounded by a population of alien speech; and such was probably the case with the Jews in Babylonia. See HEBREW LANGUAGE, vol. xi. p. 597. Even so late as the time of Ezra Hebrew was in all probability the ordinary language of the new community. In Neh. xiii. 24 we find a complaint that the children of Jews by wives from Ashdod and other places spoke half in the "Jewish" language and half in the language of Ashdod, or whatever else may have been the tongue of their mothers. No one can suppose that Nehemiah would have been particularly zealous that the children of Jews should speak an Aramaic dialect with correctness. He no doubt refers to Hebrew as it was then spoken,—a stage in its development of which Nehemiah's own work gives a very fair idea. And, moreover, the inhabitants of Ashdod spoke Hebrew. G. Hoffmann³ has deciphered inscriptions (written in Greek letters, but, after the Hebrew fashion, from right to left) on two coins struck about 150 years after Nehemiah, which are in pure Hebrew⁴; nor does the language seem to diverge at all from that of the Old Testament. It is therefore probable that Nehemiah alludes only to a slightly different local dialect. If the Philistines of Ashdod still continued to speak Hebrew about the year 300 B.C., it cannot be supposed that the Jews had given up this their own language nearly three centuries earlier. We may also conclude that the Philistines from the earliest period spoke the same language as their eastern neighbours, with whom they had so often been at war, but had also lived in close pacific intercourse.

After the time of Alexander large bodies of the Jewish population were settled in Alexandria and other western cities, and were very rapidly Hellenized. Meanwhile the principal language of Syria and the neighbouring countries, Aramaic, the influence of which may be perceived even in some pre-exilic writings, began to spread more and more among the Jews. Hebrew gradually ceased to be the language of the people and became that of religion and the schools. The book of Daniel, written in 167 or 166 B.C., begins in Hebrew, then suddenly passes into Aramaic, and ends again in Hebrew. Similarly the redactor of Ezra (or more correctly of the Chronicles, of which Ezra and Nehemiah form the conclusion) borrows large portions from an Aramaic work, in most cases without translating them into Hebrew. No reason can be assigned for the use of Aramaic in Jewish works intended primarily for Jerusalem, unless it were already the dominant speech, whilst, on the other hand, it was very natural for a pious Jew to write in the

¹ For example, we may conclude with tolerable certainty, from the presence and absence of the vowel-letters *y* and *v*, that in older times the accented *e* and *o* were not pronounced long, and that, on the other hand, the diphthongs *au* and *ai* were used for the later *o* and *e*.

² The very first word of the Bible contains an Aleph (*spiritus lenis*), which is required by etymology and was once audible, but which the pronunciation represented by the point-system ignores.

³ See Sallet's *Zeitschrift für Numismatik*, 1882 (Berlin).

⁴ The inscriptions, short as they are, exhibit the exclusively Hebrew word *ir* ('*ir*'), "*town*," and the feminine *asina* (*hasina*), "*the strong*," with the termination *ah* (not *at*, as in Phœnician). Had the Ashdodites been accustomed to use a dead language on their coins they would certainly have employed the native Semitic writing.

ancient "holy" language even after it had ceased to be spoken. Esther, Ecclesiastes, and a few Psalms, which belong to the 3d and 2d centuries before our era, are indeed written in Hebrew, but are so strongly tinged by the Aramaic influence as to prove that the writers usually spoke Aramaic. We are not likely to be far wrong in saying that in the Maccabæan age Hebrew had died out among the Jews, and there is nothing to show that it survived longer amongst any of the neighbouring peoples.

Hebrew
of the
schools.

But in the last period of the history of Jerusalem, and still more after the destruction of the city by Titus, the Jewish schools played so important a part that the life of the Hebrew language was in a manner prolonged. The lectures and discussions of the learned were carried on in that tongue. We have very extensive specimens of this more modern Hebrew in the Mishnah and other works, and scattered pieces throughout both Talmuds. But, just as the "classical" Sanskrit, which has been spoken and written by the Brahmans during the last twenty-five centuries, differs considerably from the language which was once in use among the people, so this "language of the learned" diverges in many respects from the "holy language"; and this distinction is one of which the rabbis were perfectly conscious. The "language of the learned" borrows a great part of its vocabulary from Aramaic,¹ and this exercises a strong influence upon the grammatical forms. The grammar is perceptibly modified by the peculiar style of these writings, which for the most part treat of legal and ritual questions in a strangely laconic and pointed manner. But, large as is the proportion of foreign words and artificial as this language is, it contains a considerable number of purely Hebrew elements which do not appear in the Old Testament. Although we may generally assume, in the case of a word occurring in the Mishnah but not found in the Old Testament, that it is borrowed from Aramaic, there are several words of this class which, by their radical consonants, prove themselves to be genuine Hebrew. And even some grammatical phenomena of this language are to be regarded as a genuine development of Hebrew, though they are unknown to earlier Hebrew speech.

Medi-
æval
Hebrew.

From the beginning of the Middle Ages down to our own times the Jews have produced an enormous mass of writings in Hebrew, sometimes closely following the language of the Bible, sometimes that of the Mishnah, sometimes introducing in a perfectly inorganic manner a great quantity of Aramaic forms, and occasionally imitating the Arabic style. The study of these variations has but little interest for the linguist, since they are nothing but a purely artificial imitation, dependent upon the greater or less skill of the individual. The language of the Mishnah stands in much closer connexion with real life, and has a definite *raison d'être*; all later Hebrew is to be classed with mediæval and modern Latin. Much Hebrew also was written in the Middle Ages by the hostile brethren of the Jews, the Samaritans; but for the student of language these productions have, at the most, the charm attaching to curiosities.

Char-
acter of
ancient
Hebrew.

The ancient Hebrew language, especially in the matter of syntax, has an essentially primitive character. Parataxis of sentences prevails over hypotaxis to a greater extent than in any other literary Semitic language with which we are well acquainted. The favourite method is to link sentences together by means of a simple "and." There is a great lack of particles to express with clearness the more subtle connexion of ideas. The use of the verbal tenses is in a great measure determined by the imagination,

¹ It is a characteristic feature that "my father" and "my mother" are here expressed by purely Aramaic forms. Even the learned did not wish to call their "papas" and "mamas" by any other names than those to which they had been accustomed in infancy.

which regards things unaccomplished as accomplished and the past as still present. There are but few words or inflexions to indicate slight modifications of meaning, though in ancient times the language may perhaps have distinguished certain moods of the verb somewhat more plainly than the present punctuation does. But in any case this language was far less suited for the definite expression of studied thought, and less suited still for the treatment of abstract subjects, than for poetry. We must remember, however, that as long as Hebrew was a living language it never had to be used for the expression of the abstract. Had it lived somewhat longer it might very possibly have learnt to adapt itself better to the formulating of systematic conceptions. The only book in the Old Testament which attempts to grapple with an abstract subject in plain prose—namely, Ecclesiastes—dates from a time when Hebrew was dying out or was already dead. That the gifted author does not always succeed in giving clear expression to his ideas is partly due to the fact that the language had never been employed for any scientific purposes whatsoever. With regard to grammatical forms, Hebrew has lost much that is still preserved in Arabic; but the greater richness of Arabic is in part the result of later development.

The vocabulary of the Hebrew language is, as we have said, known but imperfectly. The Old Testament is no very large work; it contains, moreover, many repetitions, and a great number of pieces which are of little use to the lexicographer. On the other hand, much may be derived from certain poetical books, such as Job. The numerous ἀπαξ λεγόμενα are a sufficient proof that many more words existed than appear in the Old Testament, the writers of which never had occasion to use them. Were we in possession of the whole Hebrew vocabulary in the time of Jeremiah, for example, we should be far better able to determine the relation in which Hebrew stands to the other Semitic languages, the Old Testament would be far more intelligible to us, and it would be very much easier to detect the numerous corrupt passages in our text.

Phœnician.—This dialect closely resembles Hebrew, and Phœnician is known to us from only one authentic source, namely, inscriptions, some of which date from about 600 B.C. or earlier; but the great mass of them begin with the 4th century before our era. These inscriptions² we owe to the Phœnicians of the mother-country and the neighbouring regions (Cyprus, Egypt, and Greece), as well as to the Phœnicians of Africa, especially Carthage. Inscriptions are, however, a very insufficient means for obtaining the knowledge of a language. The number of subjects treated in them is not large; many of the most important grammatical forms and many of the words most used in ordinary life do not occur. Moreover, the "lapidary style" is often very hard to understand. The repetition of obscure phrases, in the same connexion, in several inscriptions does not help to make them more intelligible. Of what use is it to us that, for instance, thousands of Carthaginian inscriptions begin with the very same incomprehensible dedication to two divinities? The difficulty of interpretation is greatly increased by the fact that single words are very seldom separated from one another, and that vowel-letters are used extremely sparingly. We therefore come but too often upon very ambiguous groups of letters. In spite of this, our knowledge of Phœnician has made considerable progress of late. Some assistance is also got from Greek and Latin writers, who cite not only many Phœnician proper names but single Phœnician words: Plautus in particular inserts in the *Pœnulus* whole passages in Punic, some of which are accompanied by a Latin

² The scattered materials are being collected in the *Corpus Inscriptionum Semiticarum* of the Paris Academy.

translation. This source of information must, however, be used with great caution. It was not the object of Plautus to exhibit the Punic language with precision, a task for which the Latin alphabet is but ill adapted, but only to make the populace laugh at the jargon of the hated Carthaginians. Moreover, he had to force the Punic words into Latin *senarii*; and finally the text, being unintelligible to copyists, is terribly corrupt. Much ingenuity has been wasted on the Punic of Plautus; but the passage yields valuable results to cautious investigation which does not try to explain too much.¹ In its grammar Phœnician closely resembles Hebrew. In both dialects the consonants are the same, often in contrast to Aramaic and other cognate languages.² As to vowels, Phœnician seems to diverge rather more from Hebrew. The connecting of clauses is scarcely carried further in the former language than in the latter. A slight attempt to define the tenses more sharply appears once at least in the joining of *kān* (fruit) with a perfect, to express complete accomplishment (or the pluperfect).³ One important difference is that the use of *wāw* conversive with the imperfect—so common in Hebrew and in the inscription of Mesha—is wanting in Phœnician. The vocabulary of the language is very like that of Hebrew, but words rare in Hebrew are often common in Phœnician. For instance, "to do" is in Phœnician not *asā* but *pa'al* (the Arabic *fa'ala*), which in Hebrew occurs only in poetry and elevated language. "Gold" is not *zahab* (as in most Semitic languages) but *harûṣ* (Assyrian *hurûṣ*), which is used occasionally in Hebrew poetry. Traces of dialectal distinctions have been found in the great inscription of Byblus, the inhabitants of which seem to be distinguished from the rest of the Phœnicians in Josh. xiii. 5 (and 1 Kings v. 32 [A. V. v. 18]). It is probable that various differences between the language of the mother-country and that of the African colonies arose at an early date, but our materials do not enable us to come to any definite conclusion on this point. In the later African inscriptions there appear certain phonetic changes, especially in consequence of the softening of the gutturals,—changes which show themselves yet more plainly in the so-called Neo-Punic inscriptions (beginning with the 1st, if not the 2d, century before our era). In these the gutturals, which had lost their real sound, are frequently interchanged in writing; and other modifications may also be perceived. Unfortunately the Neo-Punic inscriptions are written in such a debased indistinct character that it is often impossible to discover with certainty the real form of the words. This dialect was still spoken about 400, and perhaps long afterwards, in those districts of North Africa which had once belonged to Carthage. It would seem that in the mother-country the Phœnician language withstood the encroachment of Greek on the one hand and of Aramaic on the other somewhat longer than Hebrew did.

Aramaic.—Aramaic is nearly related to Hebræo-Phœnician; but there is nevertheless a sharp line of demarcation between the two groups. Of its original home nothing certain is known. In the Old Testament "Aram" appears at an early period as a designation of certain districts in Syria ("Aram of Damascus," &c.) and in Mesopotamia ("Aram of the Two Rivers"). The language of the

Aramæans gradually spread far and wide, and occupied all Syria, both those regions which were before in the possession of the Kheta, probably a non-Semitic people, and those which were most likely inhabited by Canaanite tribes; last of all, Palestine became Aramaized. Towards the east this language was spoken on the Euphrates, and throughout the districts of the Tigris south and west of the Armenian and Kurdish mountains; the province in which the capitals of the Arsacides and the Sāsānians were situated was called "the country of the Aramæans." In Babylonia and Assyria a large, or perhaps the larger, portion of the population were most probably Aramæans, even at a very early date, whilst Assyrian was the language of the Government.

The oldest extant Aramaic documents consist of inscriptions on monuments and on seals and gems. In the Persian period Aramaic was the official language of the provinces west of the Euphrates; and this explains the fact that coins which were struck by governors and vassal princes in Asia Minor, and of which the stamp was in some cases the work of skilled Greek artists, bear Aramaic inscriptions, whilst those of other coins are Greek. This, of course, does not prove that Aramaic was ever spoken in Asia Minor and as far north as Sinope and the Hellespont. In Egypt Aramaic inscriptions have been found of the Persian period, one bearing the date of the fourth year of Xerxes (482 B.C.)⁴; we have also official documents on papyrus, unfortunately in a very tattered condition for the most part, which prove that the Persians preferred using this convenient language to mastering the difficulties of the Egyptian systems of writing. It is, further, very possible that at that time there were considerable numbers of Aramæans in Egypt, just as there were of Phœnicians, Greeks, and Jews. But probably this preference for Aramaic originated under the Assyrian empire, in which a very large proportion of the population spoke Aramaic, and in which this language would naturally occupy a more important position than it did under the Persians. We therefore understand why it was taken for granted that a great Assyrian official could speak Aramaic (2 Kings xviii. 26; Isa. xxxvi. 11), and for the same reason the dignitaries of Judah appear to have learned the language (*ibid.*), namely, in order to communicate with the Assyrians.⁵ The short dominion of the Chaldeans very probably strengthened this preponderance of Aramaic. A few ancient Aramaic inscriptions have lately been discovered far within the limits of Arabia, in the palm oasis of Teimā (in the north of the Ḥijāz); the oldest and by far the most important of these was very likely made before the Persian period. We may presume that Aramaic was introduced into the district by a mercantile colony, which settled in this ancient seat of commerce, and in consequence of which Aramaic may have remained for some time the literary language of the neighbouring Arabs. All these older Aramaic monuments exhibit a language which is almost absolutely identical. One peculiarity which distinguishes it from later Aramaic is that in the relative and demonstrative pronoun the sound originally pronounced *dh* is changed into *z*, as in Hebrew, not into *d*, as is required by a rule universal in the Aramaic dialects.⁶ The Egyptian monuments at least bear marks of Hebrew, or more correctly Phœnician, influence.

The Aramaic portions of the Old Testament show us Biblical the form of the language which was in use among the Aramaic Jews of Palestine. Isolated passages in Ezra perhaps

⁴ See the Palæographical Society's *Oriental Series*, plate lxiii.

⁵ We possess certain small documents in Semitic writing which date from the Assyrian period, but of which the linguistic character is still very obscure; they contain Aramaic, Phœnician, and probably Assyrian forms. See *Z.D.M.G.*, xxxiii. 321.

⁶ Some traces of this phenomenon are found later.

¹ See Gildemeister, in Ritschl's *Plautus* (vol. ii. fasc. v., Leipsic, 1884).

² At an early period the Phœnician pronunciation may have distinguished a greater number of original consonants than are distinguished in writing. It is at least remarkable that the Greeks render the name of the city of Ḥur (Hebrew Ḥôr), which must originally have been pronounced Thurr, with a τ (*Tûpos*), and the name of Ḥidôn, where the ḡ runs through all the Semitic languages, with a σ (*Σιδών*). Distinctions of this kind, justified by etymology, have perhaps been obscured in Hebrew by the imperfection of the alphabet. In the case of *sin* and *shin* this can be positively proved.

³ *Kān nadar*, "had vowed," *Idal*. 5 (*C.I.S.*, Phœn., No. 93).

belong to the Persian period, but have certainly been remodelled by a later writer.¹ Yet in Ezra we find a few antique forms which do not occur in Daniel. The Aramaic pieces contained in the Bible have the great advantage of being furnished with vowels and other orthographical signs, though these were not inserted until long after the composition of the books, and are sometimes at variance with the text itself. But, since Aramaic was still a living language when the punctuation came into existence, and since the lapse of time was not so very great, the tradition ran less risk of corruption than in the case of Hebrew. Its general correctness is further attested by the innumerable points of resemblance between this language and Syriac, with which we are accurately acquainted. The Aramaic of the Bible exhibits various antique features which afterwards disappeared,—for example, the formation of the passive by means of internal vowel-change, and the causative with *ha* instead of with *a*,—phenomena which have been falsely explained as Hebraisms. Biblical Aramaic agrees in all essential points with the language used in the numerous inscriptions of Palmyra (beginning soon before the Christian era and extending to about the end of the 3d century) and on the Nabatean coins and stone monuments (concluding about the year 100). Aramaic was the language of Palmyra, the aristocracy of which were to a great extent of Arabian extraction. In the northern portion of the Nabatean kingdom (not far from Damascus) there was probably a large Aramaic population, but farther south Arabic was spoken. At that time, however, Aramaic was highly esteemed as a cultivated language, for which reason the Arabs in question made use of it, as their own language was not reduced to writing, just as in those ages Greek inscriptions were set up in many districts where no one spoke Greek. That the Nabateans were Arabs is sufficiently proved by the fact that, with the exception of a few Greek names, almost all the numerous names which occur in the Nabatean inscriptions are Arabic, in many cases with distinctly Arabic terminations. A further proof of this is that in the great inscriptions over the tombs of Hejr (not far from Teimá) the native Arabic continually shows through the foreign disguise,—for instance, in the use of Arabic words whenever the writer does not happen to remember the corresponding Aramaic terms, in the use of the Arabic particle *fa*, of the Arabic *ghair*, “other than,” and in several syntactic features. The great inscriptions cease with the overthrow of the Nabatean kingdom by Trajan (105); but the Arabian nomads in those countries, especially in the Sinaitic peninsula, often scratched their names on the rocks down to a later period, adding some benedictory formula in Aramaic. The fact that several centuries afterwards the name of “Nabatean” was used by the Arabs as synonymous with “Aramaean” was probably due to the gradual spread of Aramaic over a great part of what had once been the country of the Nabateans. In any case Aramaic then exercised an immense influence. This is also proved by the place which it occupies in the strange Pahlavi writing, various branches of which date from the time of the Parthian empire (see PAHLAVI). Biblical Aramaic, as also the language of the Palmyrene and Nabatean inscriptions, may be described as an older form of Western Aramaic. The opinion that the Palestinian Jews brought their Aramaic dialect direct from Babylon—whence the incorrect name “Chaldee”—is altogether untenable.

Aramaic of Targums, &c. We may now trace somewhat further the development of Western Aramaic in Palestine; but unhappily few of

the sources from which we derive our information can be thoroughly trusted. In the synagogues it was necessary that the reading of the Bible should be followed by an oral “targúm” or translation into Aramaic, the language of the people. The Targum was at a later period fixed in writing, but the officially sanctioned form of the Targum to the Pentateuch (the so-called Targum of Onkelos) and of that to the prophets (the so-called Jonathan) was not finally settled till the 4th or 5th century, and not in Palestine but in Babylonia. The redactors of the Targum preserved on the whole the older Palestinian dialect; yet that of Babylon, which differed considerably from the former, exercised a vitiating influence. The punctuation, which was added later, first in Babylonia, is far less trustworthy than that of the Aramaic pieces in the Bible. The language of Onkelos and Jonathan differs but little from Biblical Aramaic. The language spoken some time afterwards by the Palestinian Jews, especially in Galilee, is exhibited in a series of rabbinical works, the so-called Jerusalem Targums (of which, however, those on the Hagiographa are in some cases of later date), a few Midrashic works, and the Jerusalem Talmud. Unfortunately all these books, of which the Midrashim and the Talmud contain much Hebrew as well as Aramaic, have not been handed down with care, and require to be used with great caution for linguistic purposes. Moreover, the influence of the older language and orthography has in part obscured the characteristics of these popular dialects; for example, various gutturals are still written, although they are no longer pronounced. The adaptation of the spelling to the real pronunciation is carried furthest in the Jerusalem Talmud, but not in a consistent manner. Besides, all these books are without vowel-points; but the frequent use of vowel-letters in the later Jewish works renders this defect less sensible.

Not only the Jews but also the Christians of Palestine retained their native dialect for some time as an ecclesiastical and literary language. We possess translations of the Gospels and fragments of other works in this dialect by the Palestinian Christians dating from about the 5th century, accompanied by a punctuation which was not added till some time later. This dialect closely resembles that of the Palestinian Jews, as was to be expected from the fact that those who spoke it were of Jewish origin.

Finally, the Samaritans, among the inhabitants of Samaria, translated their only sacred book, the Pentateuch, into their own dialect. The critical study of this translation proves that the language which lies at its base was very much the same as that of the neighbouring Jews. Perhaps, indeed, the Samaritans may have carried the softening of the gutturals a little further than the Jews of Galilee. Their absurd attempt to embellish the language of the translation by arbitrarily introducing forms borrowed from the Hebrew original has given rise to the false notion that Samaritan is a mixture of Hebrew and Aramaic. The introduction of Hebrew and even of Arabic words and forms was practised in Samaria on a still larger scale by copyists who lived after Aramaic had become extinct. The later works written in the Samaritan dialect are, from a linguistic point of view, as worthless as the compositions of Samaritans in Hebrew; the writers, who spoke Arabic, endeavoured to write in languages with which they were but half acquainted.

All these Western Aramaic dialects, including that of the oldest inscriptions, have this feature among others in common, that they form the third person singular masculine and the third person plural masculine and feminine in the imperfect by prefixing *y*, as do the other Semitic languages. And in these dialects the termination *a* (the so-called “status emphaticus”) still retained

¹ The decree which is said to have been sent by Ezra is in its present form a comparatively late production.

the meaning of a definite article down to a tolerably late period.

As early as the 7th century the conquests of the Moslems greatly circumscribed the domain of Aramaic and a few centuries later it was almost completely supplanted in the west by Arabic. For the Christians of those countries, who, like every one else, spoke Arabic, the Palestinian dialect was no longer of importance, and they adopted as their ecclesiastical language the dialect of the other Aramæan Christians, the Syriac (or Edessene). The only localities where a Western Aramaic dialect still survives are a few villages in Anti-Libanus. Our information upon this subject is but slight and fragmentary; but it is hoped that Professors Prym and Socin will soon be able to furnish more ample details.

Babylonian and Mandæan dialects.

The popular Aramaic dialect of Babylonia from the 4th to the 6th century of our era is exhibited in the Babylonian Talmud, in which, however, as in the Jerusalem Talmud, there is a constant mingling of Aramaic and Hebrew passages. To a somewhat later period, and probably not to exactly the same district of Babylonia, belong the writings of the MANDÆANS (*q.v.*), a strange sect, half Christian and half heathen, who from a linguistic point of view possess the peculiar advantage of having remained almost entirely free from the influence of Hebrew, which is so perceptible in the Aramaic writings of Jews as well as of Christians. The orthography of the Mandæans comes nearer than that of the Talmud to the real pronunciation, and in it the softening of the gutturals is most clearly seen. In other respects there is a close resemblance between Mandæan and the language of the Babylonian Talmud. The forms of the imperfect which we have enumerated above take in these dialects *n* or *l*.¹ In Babylonia, as in Syria, the language of the Arabic conquerors rapidly drove out that of the country. The latter has long been totally extinct, unless possibly a few surviving Mandæans still speak among themselves a more modern form of their dialect.

Syriac or Edessan Aramaic.

At Edessa, in the west of Mesopotamia, the native dialect had already been used for some time as a literary language, and had been reduced to rule through the influence of the schools (as is proved by the fixity of the grammar and orthography) even before Christianity acquired power in the country in the 2d century. At an early period the Old and New Testaments were here translated, with the help of Jewish tradition. This version (the so-called Peshitta or Peshito) became the Bible of Aramæan Christendom, and Edessa became its capital. Thus the Aramæan Christians of the neighbouring countries, even those who were subjects of the Persian empire, adopted the Edessan dialect as the language of the church, of literature, and of cultivated intercourse. Since the ancient name of the inhabitants, "Aramæans," just like that of Ἑλλήνες, had acquired in the minds of Jews and Christians the unpleasant signification of "heathens," it was generally avoided, and in its place the Greek terms "Syrians" and "Syriac" were used. But "Syriac" was also the name given by the Jews and Christians of Palestine to their own language, and both Greeks and Persians designated the Aramæans of Babylonia as "Syrians." It is therefore, properly speaking, incorrect to employ the word "Syriac" as meaning the language of Edessa alone; but, since it was the most important of these dialects, it has the best claim to this generally received appellation. It has, as we have said, a shape very definitely fixed; and in it the above-mentioned forms of the imperfect take an *n*. As in the Babylonian dialects, the termination *ā* has become so completely a part of the substantive to which it is added that it has wholly lost the meaning of the definite

article, whereby the clearness of the language is perceptibly impaired. The influence exercised by Greek is very apparent in Syriac. From the 3d to the 7th century an extensive literature was produced in this language, consisting chiefly, but not entirely, of ecclesiastical works. In the development of this literature the Syrians of the Persian empire took an eager part. In the Eastern Roman empire Syriac was, after Greek, by far the most important language; and under the Persian kings it virtually occupied a more prominent position as an organ of culture than the Persian language itself. The conquests of the Arabs totally changed this state of things. But meanwhile, even in Edessa, a considerable difference had arisen between the written language and the popular speech, in which the process of modification was still going on. About the year 700 it became a matter of absolute necessity to systematize the grammar of the language and to introduce some means of clearly expressing the vowels. The principal object aimed at was that the text of the Syriac Bible should be recited in a correct manner. But, as it happened, the eastern pronunciation differed in many respects from that of the west. The local dialects had to some extent exercised an influence over the pronunciation of the literary tongue; and, on the other hand, the political separation between Rome and Persia, and yet more the ecclesiastical schism—since the Syrians of the east were mostly Nestorians, those of the west Monophysites and Catholics—had produced divergencies between the traditions of the various schools. Starting, therefore, from a common source, two distinct systems of punctuation were formed, of which the western is the more convenient, but the eastern the more exact and generally the more in accordance with the ancient pronunciation; it has, for example, *ā* in place of the western *ō*, and *ō* in many cases where the western Syrians pronounce *ū*. In later times the two systems have been intermingled in various ways.

Arabic everywhere put a speedy end to the predominance of Aramaic—a predominance which had lasted for more than a thousand years—and soon began to drive Syriac out of use. At the beginning of the 11th century the learned metropolitan of Nisibis, Elias bar Shinnāyā, wrote his books intended for Christians either entirely in Arabic or in Arabic and Syriac arranged in parallel columns, that is, in the spoken and in the learned language. Thus, too, it became necessary to have Syriac-Arabic glossaries. Up to the present day Syriac has remained in use for literary and ecclesiastical purposes, and may perhaps be even spoken in some monasteries and schools; but it has long been a dead language. When Syriac became extinct in Edessa and its neighbourhood is not known with certainty.

This language, called Syriac *par excellence*, is not the Neo-immediate source whence are derived the Aramaic dialects still surviving in the northern districts. In the mountains known as the Tūr 'Abdīn in Mesopotamia, in certain districts east and north of Mosul, in the neighbouring mountains of Kurdistan, and again beyond them on the western coast of Lake Urmia, Aramaic dialects are spoken by Christians and occasionally by Jews, and some of these dialects we know with tolerable precision. The dialect of Tūr 'Abdīn seems to differ considerably from all the rest; the country beyond the Tigris is, however, divided, as regards language, amongst a multitude of local dialects. Among these, that of Urmia has become the most important, since American missionaries have formed a new literary language out of it. Moreover, the Roman Propaganda has printed books in two of the Neo-Syriac dialects. All these dialects exhibit a complete transformation of the ancient type, to a degree incomparably greater than is the case, for example, with Mandæan. In particular, the ancient

¹ See Nöldeke, *Mandäische Grammatik* (Halle, 1875).

verbal tenses have almost entirely disappeared, but have been successfully replaced by new forms derived from participles. There are also other praiseworthy innovations. The dialect of Tūr 'Abdīn has, for instance, again coined a definite article. By means of violent contractions and phonetic changes some of these dialects, particularly that of Urmia, have acquired a euphony scarcely known in any other of the Semitic languages, with their "stridentia anhelantiaque verba" (Jerome). These Aramæans have all adopted a motley crowd of foreign words, from the Arabs, Kurds, and Turks, on whose borders they live and of whose languages they can often speak at least one.

Charac-
teristics
of
Aramaic.

Aramaic is frequently described as a *poor* language. This is an opinion which we are unable to share. It is quite possible, even now, to extract a very large vocabulary from the more ancient Aramaic writings, and yet in this predominantly theological literature a part only of the words that existed in the language have been preserved. It is true that Aramaic, having from the earliest times come into close contact with foreign languages, has borrowed many words from them, in particular from Persian and Greek; but, if we leave out of consideration the fact that many Syrian authors are in the habit of using, as ornaments or for convenience (especially in translations), a great number of Greek words, some of which were unintelligible to their readers, we shall find that the proportion of really foreign words in older Aramaic books is not larger, perhaps even smaller, than the proportion of Romance words in German or Dutch. The influence of Greek upon the syntax and phraseology of Syriac is not so great as that which it has exercised, through the medium of Latin, upon the literary languages of modern Europe. With regard to sounds, the most characteristic feature of Aramaic (besides its peculiar treatment of the dentals) is that it is poorer in vowels than Hebrew, not to speak of Arabic, since nearly all short vowels in open syllables either wholly disappear or leave but a slight trace behind them (the so-called *shēwā*). In this respect the punctuation of Biblical Aramaic agrees with Syriac, in which we are able to observe from very early times the number of vowels by examining the metrical pieces constructed according to the number of syllables, and with the Mandæan, which expresses every vowel by means of a vowel-letter. When several distinct dialects so agree, the phenomenon in question must be of great antiquity. There are nevertheless traces which prove that the language once possessed more vowels, and the Aramæans, for instance, with whom David fought may have pronounced many vowels which afterwards disappeared. Another peculiarity of Aramaic is that it lends itself far more readily to the linking together of sentences than Hebrew and Arabic. It possesses many conjunctions and adverbs to express slight modifications of meaning. It is also very free as regards the order of words. That this quality, which renders it suitable for a clear and limpid prose style, is not the result of Greek influence may be seen by the Mandæan, on which Greek has left no mark. In its attempts to express everything clearly Aramaic often becomes prolix,—for example, by using additional personal and demonstrative pronouns. The contrast between Aramaic as the language of prose and Hebrew as the language of poetry is one which naturally strikes us, but we must beware of carrying it too far. Even the Aramæans were not wholly destitute of poetical talent. Although the religious poetry of the Syrians has but little charm for us, yet real poetry occurs in the few extant fragments of Gnostic hymns. Moreover, in the modern dialects popular songs have been discovered which, though very simple, are fresh and full of feeling.¹ It is therefore by no

means improbable that in ancient times Aramaic was used in poems which, being contrary to the theological tendency of Syrian civilization, were doomed to total oblivion.

Assyrian.—Long before Aramaic another Semitic language flourished in the regions of the Tigris and on the lower Euphrates which has been preserved to us in the cuneiform inscriptions. It is usually called the Assyrian, after the name of the country where the first and most important excavations were made; but the term "Babylonian" would be more correct, as Babylon was the birthplace of this language and of the civilization to which it belonged. Certain Babylonian inscriptions appear to go back to the fourth millennium before our era; but the great mass of these cuneiform inscriptions date from between 1000 and 500 B.C. Assyrian seems to be more nearly related to Hebrew than to Aramaic; we may cite, for example, the relative particle *sha*, which is also used as a sign of the genitive, and is identical with the Phœnician *ash* and the Hebrew *asher* (*she*, *sha*), also the similarity between Assyrian and Hebrew in the treatment of the aspirated dentals. On the other hand, Assyrian differs in many respects from all the cognate languages. The ancient perfect has wholly disappeared, or left but few traces, and the gutturals, with the exception of the hard *kh*, have been smoothed down to a degree which is only paralleled in the modern Aramaic dialects. So at least it would appear from the writing, or rather from the manner in which Assyriologists transcribe it. The Babylonian form *bēl* (occurring in Isa. xlv. 1; Jer. l. 2 and li. 44,—passages all belonging to the 6th century B.C.), the name of the god who was originally called *ba'ḷ*, is a confirmation of this; but, on the other hand, the name of the country where Babylon was situated, viz., Shin'ar, and that of a Babylonian god, 'Anammelekh (2 Kings xvii. 31), as well as those of the tribes Shō'a and Kō'a (Ezek. xxiii. 23) who inhabited the Assyrio-Babylonian territory, seem to militate against this theory, as they are spelt in the Old Testament with 'ain. The Assyrian system of writing is so complicated, and, in spite of its vast apparatus, is so imperfect an instrument for the accurate representation of sounds, that we are hardly yet bound to regard the transcriptions of contemporary Assyriologists as being in all points of detail the final dictum of science. It is, for example, very doubtful whether the vowels at the end of words and the appended *m* were really pronounced in all cases, as this would presuppose a complete confusion in the grammar of the language. However this may be, the present writer does not feel able to speak at greater length upon Assyrian, not being an Assyriologist himself nor yet capable of satisfactorily distinguishing the certain from the uncertain results of Assyriological inquiry.

The native cuneiform writing was used in Babylonia not only under the Persian empire but also in the Greek period, as the discovery of isolated specimens proves. It does not of course necessarily follow from this that Assyrian was still spoken at that time. Indeed, this language may possibly have been banished from ordinary life long before the destruction of Nineveh, surviving only as the official and sacerdotal tongue. These inscriptions, in any case, were intended for none but a narrow circle of learned persons.

Arabic.—The southern group of Semitic languages consists of Arabic and Ethiopic. Arabic, again, is subdivided into the dialects of the larger portion of Arabia and those of the extreme south (the Sabæan, &c.). At a very much earlier time than we were but lately justified in supposing, some of the northern Arabs reduced their language to writing. For travellers have quite recently discovered in the northern parts of the Hijáz inscriptions in a strange character, which seem to have been written long before our times.

tions.

era. The character resembles the Sabæan, but perhaps represents an earlier stage of graphical development. These inscriptions have been called "Thamudic," because they were found in the country of the Thamūd; but this designation is scarcely a suitable one, because during the period when the power of the Thamūd was at its height, and when the buildings mentioned in the Koran were hewn in the rocks, the language of this country was Nabatæan (see above). Unfortunately the inscriptions hitherto discovered are all short¹ and for the most part fragmentary, and consequently furnish but little material to the student of languages. But there can be no doubt that they are written in an Arabic dialect. The treatment of the dentals, among other things, is a sufficient proof of this. At least in one point they bear a striking resemblance to Hebrew: they have the article *ha* (not *hal*, as we might expect). It is possible that the tribes living on Arabian soil which are regarded in the Old Testament as nearly related to Israel, that is, the Ishmaelites, the Midianites, and even the Edomites, may have spoken dialects occupying a middle position between Arabic and Hebrew. They are perhaps traces of some such intermediate link that have been preserved to us in these inscriptions.

Ancient
Arabic
inscriptions.

The numerous inscriptions scattered over the north-west of Arabia, especially over the wild and rocky district of Safá, near Damascus, probably date from a later period. They are written in peculiar characters, which, it would seem, are likewise related to those used by the Sabæans. They are all of them short and indistinct, scratched hurriedly and irregularly upon unhewn stone. What we at present understand of them—they consist almost entirely of proper names—is owing in nearly every case to the ingenuity of Halévy.² In matters of detail, however, much still remains uncertain. To decipher them with absolute certainty will no doubt always be impossible on account of their careless execution. These inscriptions are probably the work of Arab emigrants from the south.

The Arabs who inhabited the Nabatæan kingdom wrote in Aramaic, but, as has been remarked above, their native language, Arabic, often shows through the foreign disguise. We are thus able to satisfy ourselves that these Arabs, who lived a little before and a little after Christ, spoke a dialect closely resembling the later classical Arabic. The nominative of the so-called "triptote" nouns has, as in classical Arabic, the termination *u*; the genitive has *i* (the accusative therefore probably ended in *a*), but without the addition of *n*. Generally speaking, those proper names which in classical Arabic are "diptotes" are here devoid of any inflexional termination. The *u* of the nominative appears also in Arabic proper names belonging to more northern districts, as, for example, Palmyra and Edessa. All these Arabs were probably of the same race. It is possible that the two oldest known specimens of distinctively Arabic writing—namely, the Arabic portion of the trilingual inscription of Zabad, south-east of Haleb (Aleppo), written in Syriac, Greek, and Arabic, and dating from 512 or 513 A.D.,³ and that of the bilingual inscription of Harran, south of Damascus,⁴ written in Greek and Arabic, of 568—represent nothing but a somewhat more modern form of this dialect. In both these inscriptions proper names take in the genitive the termination *u*, which shows that the meaning of such inflexions was no longer felt. These two inscriptions, especially that of Zabad, which is badly

written, have not yet been satisfactorily interpreted in all their details.

During the whole period of the preponderance of Aramaic this language exercised a great influence upon the vocabulary of the Arabs. The more carefully we investigate the more clearly does it appear that numerous Arabic words, used for ideas or objects which presuppose a certain degree of civilization, are borrowed from the Aramaeans. Hence the civilizing influence of their northern neighbours must have been very strongly felt by the Arabs, and contributed in no small measure to prepare them for playing so important a part in the history of the world.

In the 6th century the inhabitants of the greater part of Arabia proper spoke everywhere essentially the same Arabic language, which, as being by far the most important of all Arabic dialects, is known simply as the Arabic language. Arabic poetry, at that time cultivated throughout the whole of central and northern Arabia as far as the lower Euphrates and even beyond it, employed one language only. The extant Arabic poems belonging to the heathen period were not indeed written down till much later, and meanwhile underwent considerable alterations⁵; but the absolute regularity of the metre and rhyme is a sufficient proof that on the whole these poems all obeyed the same laws of language. It is indeed highly probable that the rhapsodists and the grammarians have effaced many slight dialectical peculiarities; in a great number of passages, for example, the poets may have used, in accordance with the fashion of their respective tribes, some other case than that prescribed by the grammarians, and a thing of this kind may afterwards have been altered, unless it happened to occur in rhyme; but such alterations cannot have extended very far. A dialect that diverged in any great measure from the Arabic of the grammarians could not possibly have been made to fit into the metres. Moreover, the Arabic philologists recognize the existence of various small distinctions between the dialects of individual tribes and of their poets, and the traditions of the more ancient schools of Koran readers exhibit very many dialectical *nuances*. It might indeed be conjectured that for the majority of the Arabs the language of poetry was an artificial one,—the speech of certain tribes having been adopted by all the rest as a *dialectus poetica*. And this might be possible in the case of wandering minstrels whose art gained them their livelihood, such as Nábigha and A'shá. But, when we find that the Bedouin goat-herds, for instance, in the mountainous district near Mecca composed poems in this very same language upon their insignificant feuds and personal quarrels, that in it the proud chiefs of the Taghlibites and the Bekrites addressed defiant verses to the king of Hira (on the Euphrates), that a Christian inhabitant of Hira, Adí b. Zaid, used this language in his serious poems,—when we reflect that, as far as the Arabic poetry of the heathen period extends, there is nowhere a trace of any important linguistic difference, it would surely be a paradox to assume that all these Arabs, who for the most part were quite illiterate and yet extremely jealous of the honour of their tribes, could have taken the trouble to clothe their ideas and feelings in a foreign, or even a perfectly artificial, language. The Arabic philologists also invariably regarded the language of the poets as being that of the Arabs in general. Even at the end of the 2d century after Mohammed the Bedouins of Arabia proper, with the exception of a few outlying districts, were considered as being in possession of this pure Arabic. The most learned grammarians were in the habit of appealing to any uneducated man who happened to have just arrived with his camels from the desert, though he did not know by heart twenty verses of the Koran, and had no conception of theo-

¹ The decipherment of these inscriptions was begun by Halévy, who followed the drawings of Doughty. The subject is now being further investigated by D. H. Müller of Vienna from Euting's copies.

retical grammar, in order that he might decide whether in Arabic it were allowable or necessary to express oneself in this or that manner. It is evident that these profound scholars knew of only one classical language, which was still spoken by the Bedouins. The tribes which produced the principal poets of the earlier period belonged for the most part to portions of the Hijáz, to Nejd and its neighbourhood, and to the region which stretches thence towards the Euphrates. A great part of the Hijáz, on the other hand, plays a very unimportant part in this poetry, and the Arabs of the north-west, who were under the Roman dominion, have no share whatever in it. The dialects of these latter tribes probably diverged further from the ordinary language. The fact that they were Christians does not explain this, since the Taghlibites and other tribes who produced eminent poets also professed Christianity. Moreover, poets from the interior were gladly welcomed at the court of the Ghassanian princes, who were Christian vassals of the emperor residing near Damascus; in this district, therefore, their language was at least *understood*. It may be added that most of the tribes which cultivated poetry appear to have been near neighbours at an epoch not very far removed from that in question, and afterwards to have been scattered in large bands over a much wider extent of country. And nearly all those who were not Christians paid respect to the sanctuary of Mecca. It is a total mistake, but one frequently made by Europeans, to designate the Arabic language as "the Koráishite dialect." This expression never occurs in any Arabic author. True, in a few rare cases we do read of the dialect of the Koráish, by which is meant the peculiar local tinge that distinguished the speech of Mecca; but to describe the Arabic language as "Koráishite" is as absurd as it would be to speak of English as the dialect of London or of Oxford. This unfortunate designation has been made the basis of a theory very often repeated in modern times,—namely, that classical Arabic is nothing else but the dialect of Mecca, which the Koran first brought into fashion. So far from this being the case, it is certain that the speech of the *towns* in the Hijáz did not agree in every point with the language of the poets, and, as it happens, the Koran itself contains some remarkable deviations from the rules of the classical language. This would be still more evident if the punctuation, which was introduced at a later time, did not obscure many details. The traditions which represent the Koráish as speaking the purest of all Arabic dialects are partly the work of the imagination and partly compliments paid to the rulers descended from the Koráish, but are no doubt at variance with the ordinary opinion of the Arabs themselves in earlier days. In the Koran Mohammed has imitated the poets, though, generally speaking, with little success; the poets, on the other hand, never imitated him. Thus the Koran and its language exercised but very little influence upon the poetry of the following century and upon that of later times, whereas this poetry closely and slavishly copied the productions of the old heathen period. The fact that the poetical literature of the early Moslems has been preserved in a much more authentic form than the works of the heathen poets proves that our idea of the ancient poetry is on the whole just.

Dialect
of the
Koráish.

Changes
in
classical
Arabic.

The Koran and Islam raised Arabic to the position of one of the principal languages of the world. Under the leadership of the Koráish the Bedouins subjected half the world to both their dominion and their faith. Thus Arabic acquired the additional character of a sacred language. But soon it became evident that not nearly all the Arabs spoke a language precisely identical with the classical Arabic of the poets. The north-western Arabs played a particularly important part during the period of

the Omayyads. The ordinary speech of Mecca and Medina was, as we have seen, no longer quite so primitive as that of the desert. To this may be added that the military expeditions brought those Arabs who spoke the classical language into contact with tribes from out-of-the-way districts, such as 'Omán, Bahrain (Bahrein), and particularly the north of Yemen. The fact that numbers of foreigners, on passing over to Islam, became rapidly Arabized was also little calculated to preserve the unity of the language. Finally, the violent internal and external commotions which were produced by the great events of that time, and stirred the whole nation, probably accelerated linguistic change. In any case, we know from good tradition that even in the 1st century of the Flight the distinction between correct and incorrect speech was quite perceptible. About the end of the 2d century the system of Arabic grammar was constructed, and never underwent any essential modification in later times. The theory as to how one should express oneself was now definitely fixed. The majority of those Arabs who lived beyond the limits of Arabia already diverged far from this standard; and in particular the final vowels which serve to indicate cases and moods were no longer pronounced. This change, by which Arabic lost one of its principal advantages, was no doubt hastened by the fact that even in the classical style such terminations were omitted whenever the word stood at the end of a sentence (in pause); and in the living language of the Arabs this dividing of sentences is very frequent. Hence people were already quite accustomed to forms without grammatical terminations.

Through the industry of Arabic philologists we are able to make ourselves intimately acquainted with the system, and still more with the vocabulary of the language, although they have not always performed their task in a critical manner. We should be all the more disposed to admire the richness of the ancient Arabic vocabulary when we remember how simple are the conditions of life amongst the Arabs, how painfully monotonous their country, and consequently how limited the range of their ideas must be. Within this range, however, the slightest modification is expressed by a particular word. It must be confessed that the Arabic lexicon has been greatly augmented by the habit of citing as words by themselves such rhetorical phrases as an individual poet has used to describe an object: for example, if one poet calls the lion the "tearer" and another calls him the "mangler," each of these terms is explained by the lexicographers as equivalent to "lion." One branch of literature in particular, namely, lampoons and satirical poems, which for the most part have perished, no doubt introduced into the lexicon many expressions coined in an arbitrary and sometimes in a very strange manner. Moreover, Arabic philologists have greatly underrated the number of words which, though they occur now and then in poems, were never in general use except among particular tribes. But in spite of these qualifications it must be admitted that the vocabulary is surprisingly rich, and the Arabic dictionary will always remain the principal resource for the elucidation of obscure expressions in all the other Semitic tongues. This method, if pursued with the necessary caution, is a perfectly legitimate one.

Poems seldom enable us to form a clear idea of the language of ordinary life, and Arabic poetry happens to have been distinguished from the very beginning by a certain tendency to artificiality and mannerism. Still less does the Koran exhibit the language in its spoken form. This office is performed by the prose of the ancient traditions (Hadith). The genuine accounts of the deeds of the Prophet and of his companions, and not less the stories concerning the battles and adventures of the Bedouins in the heathen period and in the earlier days of Islam, are

Vocabu-
lary.

excellent models of a prose style, although in some cases their redaction dates from a later time.

Gram-
matical
forms
and rules.

Classical Arabic is rich not only in words but in grammatical forms. The wonderful development of the broken plurals, and sometimes of the verbal nouns must be regarded as an excess of wealth. The sparing use of the ancient terminations which mark the plural has somewhat obscured the distinction between plurals, collectives, abstract nouns, and feminines in general. In its manner of employing the verbal tenses genuine Arabic still exhibits traces of that poetical freedom which we see in Hebrew; this characteristic disappears in the later literary language. In connecting sentences Arabic can go much further than Hebrew, but the simple parataxis is by far the most usual construction. Arabic has, however, this great advantage, that it scarcely ever leaves us in doubt as to where the apodosis begins. The attempts to define the tenses more clearly by the addition of adverbs and auxiliary verbs lead to no very positive result (as is the case in other Semitic languages also), since they are not carried out in a systematic manner. The arrangement of words in a sentence is governed by very strict rules. As the subject and object, at least in ordinary cases, occupy fixed positions, and as the genitive is invariably placed after the noun that governs it, the use of case-endings loses much of its significance.

Arabic of
educated
society.

This language of the Bedouins had now, as we have seen, become that of religion, courts, and polished society. In the streets of the towns the language already diverged considerably from this, but the upper classes took pains to speak "Arabic." The poets and the *beaux esprits* never ventured to employ any but the classical language, and the "Atticists," with pedantic seriousness, convicted the most celebrated among the later poets (for instance Motanabbî) of occasional deviations from the standard of correct speech. At the same time, however, classical Arabic was the language of business and of science, and at the present day still holds this position. There are, of course, many gradations between the pedantry of purists and the use of what is simply a vulgar dialect. Sensible writers employ a kind of *κοινή*, which does not aim at being strictly correct and calls modern things by modern names, but which, nevertheless, avoids coarse vulgarisms, aiming principally at making itself intelligible to all educated men. The reader may pronounce or omit the ancient terminations as he chooses. This language lived on, in a sense, through the whole of the Middle Ages, owing chiefly to the fact that it was intended for educated persons in general and not only for the learned, whereas the poetical schools strove to make use of the long extinct language of the Bedouins. As might be expected, this *κοινή*, like the *κοινή* of the Greeks, has a comparatively limited vocabulary, since its principle is to retain only those expressions from the ancient language which were generally understood, and it does not borrow much new material from the vulgar dialects.

It is entirely a mistake to suppose that Arabic is unsuited for the treatment of abstract subjects. On the contrary, scarcely any language is so well adapted to be the organ of scholasticism in all its branches. Even the tongue of the ancient Bedouins had a strong preference for the use of abstract verbal nouns (in striking contrast to the Latin, for example); thus they oftener said "Needful is thy sitting" than "It is needful that thou shouldst sit." This tendency was very advantageous to philosophical phraseology. The strict rules as to the order of words, though very unfavourable to the development of a truly eloquent style, render it all the easier to express ideas in a rigidly scientific form.

In the meantime Arabic, like every other widely spread language, necessarily began to undergo modification, and to split up into

dialects. The Arabs are mistaken in attributing this development to the influence of those foreign languages with which Arabic came into contact. Such influences can have had but little to do with dialects; the matter; for were it otherwise the language of the interior of Arabia must have remained unchanged, yet even in this region the inhabitants are very far from speaking as they did a thousand years back. A person who in Arabia or elsewhere should trust to his knowledge of classical Arabic only would resemble those travellers from the north who endeavour to make themselves understood by Italian waiters through the medium of a kind of Latin. The written language has, it is true, greatly retarded the development of the dialects. Every good Moslem repeats at least a few short *sûras* several times a day in his prayers, besides being minutely acquainted with the sacred book; and this must have had a powerful influence upon the speech of the people at large. But nevertheless dialects have formed themselves and have diverged considerably from one another. Of these there are indeed but few with which we are tolerably well acquainted; that of Egypt alone is known with real accuracy.¹ Although the French have occupied Algeria for about fifty years, we still possess but imperfect information with respect to the language of that country. It is closely connected with that of Morocco on the one hand and with that of Tunis on the other. Arabic has long been banished from Spain; but we possess a few literary works written in Spanish Arabic, and just before it became too late Pedro de Alcalá composed a grammar and a lexicon of that dialect.² We have also a few ancient specimens of the Arabic which was once spoken in Sicily. To the western group of dialects belongs the language of Malta, which, cut off as it is from other Arabic dialects and exposed to the influence of Italian, has developed itself in a very strange manner; in it a considerable number of books have already been printed, but with Latin characters. The dialects of Arabia, Syria, and the other Eastern provinces, in spite of many valuable works, are not yet sufficiently well known to admit of being definitely classified.

There can be no doubt that the development of these dialects is in part the result of older dialectical variations which were already in existence in the time of the Prophet. The histories of dialects which differ completely from one another often pursue an analogous course. In general, the Arabic dialects still resemble one another more than we might expect when we take into consideration the great extent of country over which they are spoken and the very considerable geographical obstacles that stand in the way of communication. But we must not suppose that people, for instance, from Mosul, Morocco, San'a, and the interior of Arabia would be able to understand one another without difficulty. It is a total error to regard the difference between the Arabic dialects and the ancient language as a trifling one, or to represent the development of these dialects as something wholly unlike the development of the Romance languages. No living Arabic dialect diverges from classical Arabic so much as French or Rouman from Latin; but, on the other hand, no Arabic dialect resembles the classical language so closely as the Lugodoric dialect, which is still spoken in Sardinia, resembles its parent speech, and yet the lapse of time is very much greater in the case of the latter.

Sabæan.—Long before Mohammed, a peculiar and highly developed form of civilization had flourished in the table-land to the south-west of Arabia. The more we become acquainted with the country of the ancient Sabæans and with its colossal edifices, and the better we are able to decipher its inscriptions, which are being discovered in ever-increasing numbers, the easier it is for us to account for the haze of mythical glory wherewith the Sabæans were once invested. The Sabæan inscriptions (which till lately were more often called by the less correct name of "Himyaritic") begin long before our era and continue till about the 4th century. The somewhat stiff character is always very distinct; and the habit of regularly dividing the words from one another renders decipherment easier, which, however, has not yet been performed in a very satisfactory manner, owing in part to the fact that the vast majority of the documents in question consist of religious votive tablets with peculiar sacerdotal expressions, or of architectural notices abounding in technical terms. These inscriptions fall into two classes, distinguished partly by grammatical peculiarities and partly by peculiarities of phraseology. One dialect, which forms the causative with *ha*, like Hebrew and others, and employs, like nearly

¹ W. Spitta-Bey, *Grammatik des arabischen Vulgärdialects von Aegypten* (Leipsic, 1880).

² They were published in 1505, reprinted by Lagarde (*Petri Hispani de Lingua Arabica Libri duo*, Göttingen, 1883).

all the Semitic languages, the termination *h* (*hā*) as the suffix of the third person singular, is the Sabæan properly speaking. The other, which expresses the causative by *sa* (corresponding to the Shaphel of the Aramæans and others), and for the suffix uses *s* (like the Assyrian *sh*), is the Minaic. To this latter branch belong the numerous South Arabic inscriptions recently found in the north of the Hijáz, near Hejr, where the Minæans must have had a commercial settlement. The difference between the two classes of inscriptions is no doubt ultimately based upon a real divergence of dialect. But the singular manner in which districts containing Sabæan inscriptions and those containing Minaic alternate with one another seems to point in part to a mere hieratic practice of clinging to ancient modes of expression. Indeed it is very probably due to conscious literary conservatism that the language of the inscriptions remains almost entirely unchanged through many centuries. A few inscriptions from districts rather more to the east exhibit certain linguistic peculiarities, which, however, may perhaps be explained by the supposition that the writers did not, as a rule, speak this dialect, and therefore were but imperfectly acquainted with it.

Gram-
matical
forms.

As the Sabæan writing seldom indicates the vowels, our knowledge of the language is necessarily very incomplete; and the unvarying style of the inscriptions excludes a great number of the commonest grammatical forms. Not a single occurrence of the first or second person has yet been detected, with the possible exception of one proper name, in which "our god" apparently occurs. But the knowledge which we already possess amply suffices to prove that Sabæan is closely related to Arabic as we are acquainted with it. The former language possesses the same phonetic elements as the latter, except that it has at least one additional sibilant, which appears to have been lost in Arabic. It possesses the broken plural, a dual form resembling that used in Arabic, &c. It is especially important to notice that Sabæan expresses the idea of indefiniteness by means of an appended *m*, just as Arabic expresses it by means of an *n*, which in all probability is a modification of the former sound. Both in this point and in some others Sabæan appears more primitive than Arabic, as might be expected from the earlier date of its monuments. The article is formed by appending an *n*. In its vocabulary also Sabæan bears a great resemblance to Arabic, although, on the other hand, it often approaches more nearly to the northern Semitic languages in this respect; and it possesses much that is peculiar to itself.¹

Soon after the Christian era Sabæan civilization began to decline, and completely perished in the wars with the Abyssinians, who several times occupied the country, and in the 6th century remained in possession of it for a considerable period. In that age the language of central Arabia was already penetrating into the Sabæan domain. It is further possible that many tribes which dwelt not far to the north of the civilized districts had always spoken dialects resembling central Arabic rather than Sabæan. About the year 600 "Arabic" was the language of all Yemen, with the exception perhaps of a few isolated districts, and this process of assimilation continued in later times. Several centuries after Mohammed learned Yemenites were acquainted with the characters of the inscriptions which abounded in their country; they were also able to decipher the proper names and a small number of Sabæan words the meaning of which was still known to them, but they could no longer understand the inscriptions as a

whole. Being zealous local patriots, they discovered in those inscriptions which they imagined themselves to be capable of deciphering many fabulous stories respecting the glory of the ancient Yemenites.

Farther to the east, in the sea-coast districts of Shihr and Mahra, Dialects up to the borders of the barren desert of the interior, and also, we akin to are told, in the island of Socotra, dialects very unlike Arabic are Sabæan. still spoken. Allusions to this fact are found in Arabic writers of the 10th century. These dialects depart widely from the ancient Semitic type, but bear some resemblance to the Sabæan, although they cannot be regarded as actually descended from the latter. One feature which they have in common with Sabæan is the habit of appending an *n* to the imperfect. Like the Ethiopic, and probably also the Sabæan, they use *k* (instead of *t*) in the terminations of the first person singular and the second person singular and plural of the perfect tense. In the suffixes of the third person there appears, at least in the feminine, an *s*, as in the Minaic. Unfortunately the information which we have hitherto possessed respecting these dialects is meagre and inexact, in part very inexact.² It is much to be wished that soon they may all be investigated as carefully as possible, the more so as there is danger in delay, for Arabic is gradually supplanting them.

Ethiopic.—In Abyssinia, too, and in the neighbouring Geez, or countries we find languages which bear a certain resemblance to Arabic. The Geez or Ethiopic³ proper, the language of the ancient kingdom of Aksúm, was reduced to writing at an early date. To judge by the few passages communicated by Salt, the back of the inscription of Aezanas, king of Aksúm about 350, exhibits writing in the Sabæan language, which appears to prove that the development of the Geez character out of the Sabæan, and the elevation of Geez to the rank of a literary language, must have taken place after the year 350. The oldest monuments of this language which are known with certainty are the two great inscriptions of Tázéná, a heathen king of Aksúm, dating from about 500. Hitherto our acquaintance with these inscriptions has been derived from very imperfect drawings⁴; but they amply suffice to show that we have here the same language as that in which the Ethiopic Bible is written, with the very same exact indication of the vowels,—a point in which Ethiopic has an advantage over all other Semitic characters. Who introduced this vocalization is unknown. When the above-mentioned inscriptions were made the Bible had probably been already translated into Geez from the Greek, perhaps in part by Jews; for Jews and Christians were at that time actively competing with one another, both in Arabia and in Abyssinia; nor were the former unsuccessful in making proselytes. The missionaries who gave the Bible to the Abyssinians must, at least in some cases, have spoken Aramaic as their mother-tongue, for this alone can explain the fact that in the Ethiopic Bible certain religious conceptions are expressed by Aramaic words. During the following centuries various works were produced by the Abyssinians in this language; they were all, so far as we are able to judge, of a more or less theological character, almost invariably translations from the Greek. We cannot say with certainty when Geez ceased to be the language of the people, but it was probably about a thousand years ago. From the time when the Abyssinian kingdom was reconstituted, towards the end of the 13th century, by the so-called Solomonian dynasty (which was of southern origin), the language of the court and of the Government was Amharic; but Geez remained the ecclesiastical and literary language, and Geez literature even showed a certain

² See especially Maltzan, in *Z.D.M.G.*, vols. xxv. and xxvii.

³ This name is due to the fact that the Abyssinians, under the influence of false erudition, applied the name *Aithiopia* to their own kingdom.

⁴ The authorities of the library of Frankfort have kindly enabled the present writer to consult Ruppell's copies, which are more accurate than the lithographs in his book. The English in 1868 did not seize the opportunity to examine thoroughly the antiquities of Aksúm, and since then no traveller has taken the trouble to procure accurate copies of these extremely important monuments.

¹ The literature relating to these inscriptions is widely scattered. Before the Parisian *Corpus* supplies us with the collected materials, we may hope to see the Sabæan grammar of D. H. Müller, who, with Halévy, has lately rendered the greatest services in this department.

activity in numerous translations from those Arabic and Coptic works which were in use amongst the Christians of Egypt; besides these a few original writings were composed, namely, lives of saints, hymns, &c. This literary condition lasted till modern times. The language, which had long become extinct, was by no means invariably written in a pure form; indeed even in manuscripts of more ancient works we find many linguistic corruptions, which have crept in partly through mere carelessness and ignorance, partly through the influence of the later dialects. On points of detail we are still sometimes left in doubt, as we possess no manuscripts belonging to the older period. This renders it all the more important that the ancient and authentic inscriptions upon the monuments of Aksum should be accurately published.

Charac-
teristics
of Geez.

Geez is more nearly related to Sabæan than to Arabic, though scarcely to such a degree as we might expect. The historical intercourse between the Sabæans and the people of Aksum does not, however, prove that those who spoke Geez were simply a colony from Sabæa; the language may be descended from an extinct cognate dialect of south Arabia, or may have arisen from a mingling of several such dialects. And this colonization in Africa probably began much sooner than is usually supposed. In certain respects Geez represents a more modern stage of development than Arabic; we may cite as instances the loss of some inflexional terminations and of the ancient passive, the change of the aspirated dentals into sibilants, &c. In the manuscripts, especially those of later date, many letters are confounded, namely, *h*, *ḥ*, and *kh*, *s* and *sh*, *ç* and *ç'*; this, however, is no doubt due only to the influence of the modern dialects. To this same influence, and indirectly perhaps to that of the Hamitic languages, we may ascribe the very hard sound now given to certain letters, *k*, *t*, *ç*, and *ç'*, in the reading of Geez. The last two are at present pronounced something like *ts* and *ts'* (the German *s*). A peculiar advantage possessed by Geez and by all Ethiopic languages is the sharp distinction between the imperfect and the subjunctive: in the former a vowel is inserted after the first radical,—a formation of which there seem to be traces in the dialect of Mahra, and which is also believed to have existed in Assyrian. Geez has no definite article, but is very rich in particles. In the ease with which it joins sentences together and in its freedom as to the order of words it resembles Aramaic. The vocabulary is but imperfectly known, as the theological literature, which is for the most part very arid, supplies us with comparatively few expressions that do not occur in the Bible, whereas the more modern works borrow their phraseology in part from the spoken dialects, particularly Amharic. With regard to the vocabulary, Geez has much in common with the other Semitic tongues, but at the same time possesses many words peculiar to itself; of these a considerable proportion may be of Hamitic origin. Even some grammatical phenomena seem to indicate Hamitic influence; for instance, the very frequent use of the gerundive, a feature which has become still more prominent in the modern dialects, placed as they are in yet closer contact with the Hamitic. We must not suppose that the ancient inhabitants of Aksum were of pure Semitic blood. The immigration of the Semites from Arabia was in all probability a slow process, and under such circumstances there is every reason to assume that they largely intermingled with the aborigines. This opinion seems to be confirmed by anthropological facts.

Tigré and Tigrīna. Not only in what is properly the territory of Aksum (namely, Tigrīna, Tigré, north-eastern Abyssinia), but also in the countries bordering upon it to the north, including the islands of Dahlak, dialects are still spoken which are but more modern forms of the linguistic type clearly exhibited in Geez. The two principal of these are that spoken in Tigré proper and that of the neighbouring countries.

In reality, the name of Tigré belongs to both, and it would be desirable to distinguish them from one another as Northern and Southern Tigré. But it is the custom to call the northern dialect Tigré simply, whilst that spoken in Tigré itself bears the name of Tigrīna, with an Amharic termination. It is generally assumed that Tigré bears a closer resemblance to Geez than does Tigrīna, although the latter is spoken in the country where Geez was formed; and this may very possibly be the case, for Tigrīna has during several centuries been very strongly influenced by Amharic, which has not been the case with Tigré, which is spoken partly by nomads. Of Tigré, which appears to be divided into numerous dialects, we have several glossaries; but of its grammar we as yet know but little. Written specimens of this language are almost entirely wanting. With Tigrīna we are somewhat better acquainted,¹ but only as it is spoken in the centre of the country, near the site of the ancient Aksum, where Amharic happens to be particularly strong,—above all, amongst the more educated classes. In Tigrīna the older grammatical forms are often subjected to violent alterations; foreign elements creep in; but the kernel remains Semitic.

Very different is the case with Amharic, a language of Amharic, which the domain extends from the left bank of the Takkazé into regions far to the south. Although by no means the only language spoken in these countries, it always tends to displace those foreign tongues which surround it and with which it is interspersed. We here refer especially to the Agaw dialects. Although Amharic has been driven back by the invasions of the Galla tribes, it has already compensated itself to some extent for this loss, as the Yedju and Wollo Gallas, who penetrated into eastern Abyssinia, have adopted it as their language. With the exception, of course, of Arabic, no Semitic tongue is spoken by so large a number of human beings as Amharic. The very fact that the Agaw languages are being gradually, and, as it were, before our own eyes, absorbed by Amharic² makes it appear probable that this language must be spoken chiefly by people who are not of Semitic race. This supposition is confirmed by a study of the language itself. Amharic has diverged from the ancient Semitic type to a far greater extent than any of the dialects which we have hitherto enumerated. Many of the old formations preserved in Geez are completely modified in Amharic. Of the feminine forms there remain but a few traces; and that is the case also with the ancient plural of the noun. The strangest innovations occur in the personal pronouns. And certainly not more than half the vocabulary can without improbability be made to correspond with that of the other Semitic languages. In this, as also in the grammar, we must leave out of account all that is borrowed from Geez, which, as being the ecclesiastical tongue, exercises a great influence everywhere in Abyssinia. On the other hand, we must make allowance for the fact that in this language the very considerable phonetic modifications often produce a total change of form, so that many words which at first have a thoroughly foreign appearance prove on further examination to be but the regular development of words with which we are already acquainted.³ But the most striking deviations occur in the syntax. Things which we are accustomed to regard as usual or even universal in the Semitic languages, such as the placing of the verb before the subject, of the governing noun before the genitive, and of the attributive relative clause after its substantive, are here totally reversed. Words which are marked as genitives by the prefixing of the relative particle, and even whole relative clauses, are treated as one word, and are capable of having the objective suffix added to them. It is scarcely going too far to say that a person

¹ Franz Praetorius, *Grammatik der Tigrīnasprache*, Halle, 1872. The present writer was also permitted to use the manuscript grammar of a Belgian missionary, who spent a long time in the country.

² Only an advanced guard of the Agaw languages, the Bīlīn or dialect of the Bogos, is being similarly absorbed by the Tigré.

³ Praetorius, however, in his very valuable grammar, *Die amharische Sprache* (Halle, 1879), has gone much too far in his attempts to connect Amharic words and grammatical phenomena with those that occur in Geez.

who has learnt no Semitic language would have less difficulty in mastering the Amharic construction than one to whom the Semitic syntax is familiar. What here appears contrary to Semitic analogy is sometimes the rule in Agaw. Hence it is probable that in this case tribes originally Hamitic retained their former modes of thought and expression after they had adopted a Semitic speech, and that they modified their new language accordingly. And it is not certain that the partial Semitization of the southern districts of Abyssinia (which had scarcely any connexion with the civilization of Aksúm during its best period) was entirely or even principally due to influences from the north.

In spite of its dominant position, Amharic did not for several centuries show any signs of becoming a literary language. The oldest documents which we possess are a few songs of the 15th and 16th centuries, which were not, however, written down till a later time, and are very difficult to interpret. There are also a few Geez-Amharic glossaries, which may be tolerably old. Since the 17th century various attempts have been made, sometimes by European missionaries, to write in Amharic, and in modern times this language has to a considerable extent been employed for literary purposes; nor is this to be ascribed exclusively to foreign influence. A literary language, fixed in a sufficient measure, has thus been formed. Books belonging to a somewhat earlier period contain tolerably clear proofs of dialectical differences. Scattered notices by travellers seem

to indicate that in some districts the language diverges in a very much greater degree from the recognized type.

The Abyssinian chronicles have for centuries been written in Geez, largely intermingled with Amharic elements. This "language of the chronicles," in itself a dreary chaos, often enables us to discover what were the older forms of Amharic words. A similar mixture of Geez and Amharic is exemplified in various other books, especially such as refer to the affairs of the Government and of the court.

The languages spoken still farther to the south, that of Gurágué Gurágué (south of Shoa) and that of Harar, are perhaps more fitly described and as languages akin to Amharic than as Amharic dialects. Until Harari, we possess more precise information respecting them, and in general respecting the linguistic and ethnographical condition of these countries, it would not be safe to hazard even a conjecture as to the origin of these languages, which, corrupt as they may be, and surrounded by tongues of a wholly different class, must still be regarded as Semitic. It is enough to repeat that the immigration of the Semites into these parts of Africa was probably no one single act, that it may have taken place at different times, that the immigrants perhaps belonged to different tribes and to different districts of Arabia, and that very heterogeneous peoples and languages appear to have been variously mingled together in these regions.

The clever and brilliant work of Renan, *Histoire générale des langues Sémitiques* (1st ed., Paris, 1855), could not fail to produce much effect at the time, in spite of its one-sided character and the actual mistakes that it contains. Even at the present day a scholar may read it with great interest and profit; but as a whole it has been superseded by the discoveries of the last twenty or thirty years. The remarks of Ewald, in the introduction to his Hebrew grammar, upon the mutual relationship of the Semitic languages are still worthy of perusal, much as they provoke contradiction. A work upon the subject which realizes for the present state of science what Renan endeavoured to realize for his own time unfortunately does not exist. (TH. N.)

SEMLER, JOHANN SALOMO (1725-1791), ecclesiastical historian and critic, sometimes called "the father of German rationalism" (see RATIONALISM), was born at Saalfeld in Thuringia on 18th December 1725. He was the son of a clergyman in poor circumstances, and had to fight his way in the world solely by his own talents. He grew up amidst Pietistic surroundings, which powerfully influenced him his life through, though he was never spiritually or intellectually a Pietist. As a boy he showed the omnivorous appetite for books which was characteristic of his later life. In his seventeenth year he entered the university of Halle, where he became the disciple, afterwards the assistant, and at last the literary executor of the orthodox rationalistic Professor Baumgarten. In 1749 he accepted the position of editor, with the title of professor, of the Coburg official *Gazette*, with leisure to pursue historical and scientific studies. But the next year he was invited to Altdorf as professor of philology and history, and six months later became a professor of theology in Halle. After the death of Baumgarten (1757) Semler became the head of the theological faculty of his university, and the fierce opposition which his writings and lectures provoked only helped to increase his fame as a professor. His popularity continued undiminished for more than twenty years, until 1779. In that year he came forward with a reply to the *Wolfenbüttel Fragments* (see REIMARUS) and to Bahrdt's confession of faith, a step which was interpreted by the extreme rationalists as a revocation of his own rationalistic position. Even the Prussian Government, which favoured Bahrdt, made Semler painfully feel its displeasure at this new but really not inconsistent aspect of his position. But, though Semler was really not inconsistent with himself in attacking the views of Reimarus and Bahrdt, as a comparison of his works prior and subsequent to 1779 with those in question shows, his popularity began from that year to decline, and towards the end of his life he felt painfully the necessity of emphasizing the apologetic and conservative value of true historical inquiry. With more justification, perhaps, might his defence of the notorious edict of Wöllner (1788), the cultus minister, be cited as a sign of the decline of his powers and of an unfaithfulness to his principles. He died at Halle on 14th

March 1791, worn out by his prodigious labours, embittered by his desertion, and disappointed at the issue of his work.

Semler's importance in the history of theology and the human mind is that of a critic of Biblical and ecclesiastical documents and of the history of dogmas. He was not a philosophical thinker or theologian, though he insisted, more or less confusedly, and yet with an energy and persistency before unknown, on certain distinctions of great importance when properly worked out and applied, e.g., the distinction between religion and theology, that between private personal beliefs and public historical creeds, and that between the local and temporal and the permanent elements of historical religion. His great work was that of the critic. He was the first to reject with sufficient proof the equal value of the Old and the New Testaments, the uniform authority of all parts of the Bible, the divine authority of the traditional canon of Scripture, the inspiration and supposed correctness of the text of the Old and New Testaments, and, generally, the identification of revelation with Scripture. Though to some extent anticipated by the English deist Thomas Morgan, Semler was the first to take due note of and use for critical purposes the opposition between the Judaic and anti-Judaic parties of the early church. He led the way in the task of discovering the origin of the Gospels, the Epistles, the Acts of the Apostles, and the Apocalypse. He revived previous doubts as to the direct Pauline origin of the Epistle to the Hebrews, called in question Peter's authorship of the first epistle, and referred the second epistle to the end of the 2d century. He wished to remove the Apocalypse altogether from the canon. In textual criticism Semler pursued further the principle of classifying MSS. in families, adopted by R. Simon and Bengel. Though he lacked almost every qualification of the true church historian, Semler did the work of a pioneer in many periods and in several departments of ecclesiastical history. Tholuck pronounces him "the father of the history of doctrines," and Baur "the first to deal with that history from the true critical standpoint." At the same time, it is admitted by all that he was nowhere more than a pioneer. Baur's description of his work in one department of ecclesiastical history is true of his work generally. "His writings on the history of dogma resemble a fallow-field waiting to be cultivated or a building-site on which, underneath refuse and ruins, lie the materials in chaotic confusion for a new edifice. The consequence was that as he was always occupied in preliminary labours, he brought nothing to even partial completion; and, though his general critical standpoint was correct, in its application to details his criticism could only be regarded as extremely bold and arbitrary."

Tholuck gives 171 as the number of Semler's works, of which only two reached a second edition, and none is now read for its own sake. Amongst the chief are—*De demoniacis* (Halle, 1760, 4th ed. 1779), *Selecta capita historiarum ecclesiasticarum* (3 vols., Halle, 1767-69), *Von freier Untersuchung des Kanon* (Halle, 1771-72), *Apparatus ad liberalem N. T. interpretationem* (1767; ad V. T., 1778), *Institutio ad doctrinam Christ. liberaliter discendam* (Halle,

1774), *Ueber historische, gesellschaftliche, und moralische Religion der Christen* (1786), and his autobiography, *Semler's Lebensbeschreibung, von ihm selbst abgefasst* (Halle, 1781-82).

For estimates of Semler's labours, see Gass, *Gesch. der prot. Dogmatik* (Berlin, 1854-67); Dörner, *Gesch. der prot. Theol.* (Munich, 1867); Tholuck, art. in *Herzog's Real-Encyclopädie*; Hilgenfeld, *Einleitung in das Neue Test.* (Leipsic, 1875); Baur, *Epochen der kirchlichen Geschichtsschreibung* (1852); and Ritschl, *Gesch. des Pietismus* (Bonn, 1880-84).

SEMLIN (Hung. *Zimony*; Servian, *Semun*), a town of Austria-Hungary, the easternmost in the Military Frontier district, stands on the south bank of the Danube, on a tongue of land between that river and the Save. It is the see of a Greek archbishop, has a real school of lower grade, five Roman Catholic and two Greek churches, a synagogue, a theatre, and a custom-house. The population (10,046) consists mostly of Servians, with a few Germans, Greeks, Illyrians, Croats, Gipsies, and Jews. Semlin has recently undergone improvement in its streets and buildings; but its suburb Franzenthal near the Danube consists mostly of mud huts thatched with reeds. The town is surrounded by a stockade. On the top of Zigeunerberg are the remains of the castle of John Hunyadi, who died here in 1456. Semlin has a considerable trade, sending woollen cloth, porcelain, and glass to Turkey, and obtaining in return yarn, leather, skins, honey, and meerschaum pipes. It is a principal quarantine station for travellers from Turkey. Steam ferry boats cross to Belgrade several times a day, and larger vessels run up the Save as far as to Sissek.

SEMPER, GOTTFRIED (1803-1879), German architect and writer on art, was born at Altona on 29th November 1803. His father intended him for the law, but irresistible impulse carried him over to art. His early mastery of classical literature led him to the study of classic monuments in classic lands, while his equally conspicuous talent for mathematics gave him the laws of form and proportion in architectural design. While a student of law at the university of Göttingen he fell under the influence of K. O. Müller, and in after years followed closely in his footsteps. Semper's architectural education was carried out successively in Hamburg, Berlin, Dresden, in Paris under Gau, and in Munich under Gärtner; afterwards he visited Italy and Greece. In 1834 he was appointed professor of architecture in Dresden, and during fifteen years received many important commissions from the Saxon court. He built the opera-house, which made his fame, the new museum and picture gallery, likewise a synagogue. In 1848 his turbulent spirit led him to side with the revolution against his royal patron; he furnished the rebels with military plans, and was eventually driven into exile. Semper came to London at the time of the Great Exhibition of 1851, and the prince consort found him an able ally in carrying out his plans. He was appointed teacher of the principles of decoration; and his lectures in manuscript, preserved in the art library, South Kensington, deserve to be better known. He was also employed by the prince consort to prepare a design for the Kensington Museum; he likewise made the drawings for the Wellington funeral car. In 1853 Semper left London for Zurich on his appointment as professor of architecture, and with a commission to build in that town the polytechnic school, the hospital, &c. In 1870 he was called to Vienna to assist in the great architectural projects since carried out round the Ring. A year later, after an exile of over twenty years, he received a summons to Dresden, on the rebuilding of the first opera-house, which had been destroyed by fire in 1869; his second design was a modification of the first. The closing years of his life were passed in comparative tranquillity between Venice and Rome, and in the latter city he died on 15th May 1879.

Semper's style was a growth from the classic orders through the Italian Cinque Cento. He forsook the base and rococo forms he found rooted in Germany, and, reverting to the best historic ex-

amples, fashioned a purer Renaissance. He stands as a leader in the practice of polychrome, since widely diffused, and by his writings and example did much to reinstate the ancient union between architecture, sculpture, and painting. Among his numerous literary works are *Ueber Polychromie u. ihren Ursprung* (1851), *Die Anwendung der Farben in der Architektur u. Plastik bei den Alten, Der Stil in den technischen u. tektonischen Künsten* (1860-63). His *Notes of Lectures on Practical Art in Metals and Hard Materials: its Technology, History, and Style*, remains in MS. His teachings are sometimes encumbered by speculations reaching far beyond the domain of his art.

SENAAR (SENNAAR, properly SENNĀR), a country of east Central Africa, commonly identified with the "Island of Meroe" of the ancients, and included in the central division of Egyptian (Eastern) Sūdān, as reorganized in the year 1882. By European writers the term is often applied to the whole region lying between the Atbāra (Takazze) and the White Nile, but by native usage is restricted to the district confined between the latter river and the Bahr-el-Azrak (Blue Nile), and its eastern tributaries, the Rahad and the Dender. It is bordered north and north-east by Upper Nubia, east by Abyssinia, west by the White Nile (Bahr-el-Abiad), separating it from Kordofān, and stretches from the confluence of the two Niles at Khartūm southwards, in the direction of the Berta highlands in the east and the Búrūn and Dinka plains in the west. As thus defined, Sennār extends across five degrees of latitude (16° to 11° N.), with a total length of about 350 miles, a mean breadth of 120 miles, an area of 40,000 square miles, and an approximate population of 300,000. It comprises two physically distinct tracts, the densely wooded and well-watered Jezirat el-Jesrāt ("Isle of Isles") between the Rahad and the Blue Nile, and the "island" of Sennār proper, a nearly level steppe land confined between the two main streams. This western and much larger division, which has a mean elevation of under 2000 feet above sea-level, consists mainly of alluvial and sandy matter, resting on a bed of granite and porphyritic granite, which first crops out some ten days' journey south of Khartūm, in the Jebel es-Segati and the Jebel el-Moye, near the town of Sennār on the Bahr-el-Azrak. Between these two groups the plain is dotted over with isolated slate hills containing iron and silver ores. But beyond Sennār the boundless steppe, either under a tall coarse grass, or overgrown with mimosa scrub, or else absolutely waste, again stretches uninterruptedly for another ten or eleven days' journey to the Roséres (Rosaires) district, where the isolated Okelmi and Keduss Hills, containing quartz with copper ore, rise 1000 feet above the right bank of the Blue Nile and 3000 above the sea. Here the plain is furrowed by deep gullies flushed during the rainy season; and farther south the land, hitherto gently sloping towards the north-west, begins to rise rapidly, breaking into hills and ridges 4000 feet high in the Fazogl district, and farther on merging in the Berta highlands with an extreme altitude of 9000 to 10,000 feet. In these metalliferous uplands, recently explored by Marno and Schuver, rises the Tumāt, which is washed for gold, and which after a northerly course of nearly 100 miles joins the left bank of the Blue Nile near Fazogl and Famaka. South of and parallel with the Tumāt flows the still unexplored Jabus (Yabus), on which stands Fadasi, southernmost of the now abandoned Egyptian stations in the Bahr-el-Azrak basin. This point also marks the present limit of geographical exploration in the direction of the conterminous Galla country, Schuver being the only European traveller who has hitherto succeeded in penetrating to any distance south of the Jabus.

Sennār lies within the northern limits of the tropical rains, which reach to Khartūm, and fall between June and September. In this part of its course the Blue Nile rises from May to August, when the northern and western winds prevail, nearly coinciding with the cool and healthy season. But they are followed by the hot khamúsín from the south or the samúm (simoom) from the north-west charged

with fine sand from the Libyan Desert. Still more dreaded are the miasmatic exhalations caused by the glowing sun playing on stagnant waters after the floods and giving rise to the "Sennâr fever," which drives the natives themselves from the plains to the southern uplands. The temperature, which rises at times to over 120° Fahr., is also very changeable, often sinking from 100° Fahr. during the day to under 60° Fahr. at night.

The soil, mainly alluvial, is naturally fertile, and wherever water and hands are available yields bounteous crops of maize, pulse, cotton, tobacco, sesame, and especially durra, of which as many as twenty varieties are said to be cultivated. The forest vegetation, mainly confined to the "Isle of Isles" and the southern uplands, includes the *Adansonia* (baobab), which in the Fazogl district attains gigantic proportions, the tamarind, of which bread is made, the deleb palm, several valuable gum trees (whence the term Sennâri often applied in Egypt to gum arabic), some dyewoods, ebony, ironwood, and many varieties of acacia. These forests are haunted by the two-horned rhinoceros, the elephant, lion, panther, numerous apes and antelopes, while the crocodile and hippopotamus frequent all the rivers. The chief domestic animals are the camel, horse, ass, ox, buffalo (used both as a beast of burden and for riding), sheep with a short silky fleece, the goat, cat, dog, and pig, which last here reaches its southernmost limit. The tsetse fly appears to be absent, but is replaced in some districts by a species of wasp, whose sting is said to be fatal to the camel in the rainy season.

The "African Mesopotamia" is occupied by a partly settled partly still nomad population of an extremely mixed character, including representatives of nearly all the chief ethnical divisions of the continent. But the great plain of Sennâr is mainly occupied by Hassanieh Arabs in the north, by Abu-Rof (Rufaya) Hamites of Beja stock (Robert Hartmann) in the east as far as Fazogl, and elsewhere by the Funj (Fung, Fungheh), traditionally from beyond the White Nile, and affiliated by some to the Kordofân Nubas, by others more probably to the Nilotic Negro Shillûks. These Funj, who have been the dominant race since the 15th century, have become almost everywhere assimilated in speech, religion, and habits to the Arabs. Nevertheless on their sacred Mount Guleh the traveller Pruyssenaere found them still performing pagan rites, while according to Marno the Bûrûns, the southernmost branch of the race between the Berta highlanders and the Nilotic Denkas, are addicted to cannibalism. The Berta highlanders themselves (Jebalain, as the Arabs collectively call them) are of more or less pure Negro stock and number about 80,000, grouped in several semi-independent principalities. The "no-man's-land" stretching north of Dar-Berta and east of the Tumat valley is also occupied by distinct nationalities, such as the Kadalos in the extreme north, the Sienetjos and Gumus in the east, here bordering on the Abyssinian Agaws, the Jabus and Gânti in the south. Most of these appear to be of Negro or Negroid stock; but the Sienetjos, said to be a surviving remnant of the primitive population of the whole country, are doubtless akin to the Sienetjos of Damot and Gojam in Abyssinia. They are certainly not blacks, and have a yellow or fair complexion, lighter than that of southern Europeans.

The Sennâri people cultivate a few industries, such as cotton-weaving, pottery, gold, silver, and iron work, matting, and leather work (camel saddles, sandals, &c.), noted throughout Sûdân. But their chief pursuits are stock-breeding, agriculture, and trade,—exporting to Egypt and Abyssinia gold, hides, durra, sesame, gums, ivory, horses, and slaves. The chief centres of population, all on the Bahr-el-Azrak, are Fazogl (Fazoklo), now replaced by Famaka, at the Tumat confluence; Roséres, formerly capital of an independent state; Sennâr, also an old capital, which gives its name to the whole region; Wod-Medineh at the Rahad confluence; and Khartûm, just above the junction of the two Niles. A few miles above Khartûm are the extensive ruins of Soba, former capital of the Funj empire, which at one time stretched from Wady Halfa to Dar-Berta and from Snakin to beyond Kordofân, but which was overthrown by Ismail Pasha in the year 1822. (A. H. K.)

SÉNANCOUR, ÉTIENNE PIVERT DE (1770-1846), French man-of-letters, was born at Paris in November 1770. His family was noble and not poor, but its fortunes were ruined by the Revolution. Before that event, however, Sénancour had met with mishap. He was a sickly youth and was destined for the church, but ran away from home and established himself in Switzerland. Here he married and spent some years; his wife died, and he returned to Paris about the end of the century. In 1804 he published the singular book entitled *Obermann*, which has continued to be in a fashion popular to the present day, and the next year a treatise *De l'Amour*, which had even more vogue at first, but is now little read. *Obermann*, which is to a great extent inspired by Rousseau, which attracted the admiration of George Sand, and which had

a considerable influence over the last generation in France and England, is a series of letters supposed to be written by a solitary and melancholy person, whose headquarters were in a valley of the Jura, but who writes also from divers other places. The style is meritorious, the descriptive power very considerable, the thought sometimes original, and the expression of a certain form of the *maladie du siècle* effective and striking. But, viewed from the strictly critical point of view, there is perhaps a certain unreality about the book. Its idiosyncrasy in the large class of Wertherian-Byronic literature has justly enough been said to be that the hero, instead of feeling the vanity of things, recognizes his own inability to be and do what he wishes. Sénancour is tinged to some extent with the older *philosophe* form of freethinking, and expresses less revolt from the 18th century than Chateaubriand. Having no resources but his pen, Sénancour during the half-century which elapsed between his return to France and his death at St Cloud in February 1846 was driven to literary hack work, and even his more independent productions have none of the attraction of *Obermann*. When George Sand and Sainte-Beuve revived interest in this latter, Thiers and Villemain successively obtained for the author from Louis Philippe pensions which enabled him to pass his last days in comfort. He committed the usual mistake of writing late in life a continuation to *Obermann*, entitled *Isabelle* (1833), but it has been wisely forgotten.

SENEBIER, JEAN (1742-1809), a Swiss pastor and voluminous writer on vegetable physiology, was born at Geneva on 6th May 1742. He is remembered on account of his contributions to our knowledge of the influence of light on vegetation. Though Malpighi and Hales had shown that a great part of the substance of plants must be obtained from the atmosphere, no progress was made until more than a century later, when Bonnet observed on leaves plunged in aerated water bubbles of gas, which Priestley recognized as oxygen. Ingenhousz proved the contemporaneous disappearance of carbonic acid; but it was Senebier who clearly showed that this activity was confined to the green parts, and to these only in sunlight, and first gave a connected view of the whole process of vegetable nutrition in strictly chemical terms, so preparing the way for the quantitative researches of N. T. de Saussure. Senebier died at Geneva on 22d July 1809.

See Sachs, *Geschichte d. Botanik, und Arbeiten*, vol. ii.

SENECA, LUCIUS ANNÆUS (c. 3 B.C.-65 A.D.), the most brilliant figure of his time, was the second son of the rhetorician Marcus Annæus Seneca, and, like him, a native of Corduba in Hispania. From his infancy of a delicate constitution, he devoted himself with intense ardour to rhetorical and philosophical studies and early won a reputation at the bar. Caligula threatened his life, and under Claudius his political career received a sudden check, for the influence of Messalina having effected the ruin of Julia, the youngest daughter of Germanicus, Seneca, who was compromised by her downfall, was banished to Corsica, 41 A.D. There eight weary years of waiting were relieved by study and authorship, with occasional attempts to procure his return by such gross flattery of Claudius as is found in the work *Ad Polybium de Consolatione* or the panegyric on Messalina which he afterwards suppressed. At length the tide turned; the next empress, Agrippina, had him recalled, appointed prætor, and entrusted with the education of her son Nero, then (48) eleven years old. Seneca became in fact Agrippina's confidential adviser; and his pupil's accession increased his power. He was consul in 57, and during the first bright years of the new reign, the incomparable *quinquennium Neronis*, he shared the actual administration of affairs with the worthy Burrus, the prætorian præfect. The government in the hands of these men of remarkable

insight and energy was wise and humane; their influence over Nero, while it lasted, was salutary, though sometimes maintained by doubtful means. When there came the inevitable rupture between mother and son they sided with the latter; and Seneca, who drew up all Nero's state papers, was called upon to write a defence of matricide. We must, however, regard the general tendency of his measures; to judge him as a Stoic philosopher by the counsels of perfection laid down in his writings would be much the same thing as to apply the standard of New Testament morality to the career of a Wolsey or Mazarin. He is the type of the man of letters who as courtier and minister rises into favour by talent and suppleness (*comitus honesta*), and is entitled as such to the rare credit of a beneficent rule. In course of time Nero got to dislike him more and more; the death of Burrus in 62 gave a shock to his position. In vain did he petition for permission to retire, offering to Nero at the same time his enormous fortune. Even when he had sought privacy on the plea of ill health he could not avert his doom; on a charge of being concerned in Piso's conspiracy he was forced to commit suicide. His manly end might be held in some measure to redeem the weakness of his life but for the testimony it bears to his constant study of effect and ostentatious self-complacency ("conversus ad amicos, imaginem vitæ suæ relinquere testatur").

Seneca is at once the most eminent among the Latin writers of the Silver Age and in a special sense their representative, not least because he was the originator of a false style. The affected and sentimental manner which gradually grew up in the first century A.D. became ingrained in him, and appears equally in everything which he wrote, whether poetry or prose, as the most finished product of ingenuity concentrated upon declamatory exercises, substance being sacrificed to form and thought to point. Every variety of rhetorical conceit in turn contributes to the dazzling effect, now tinsel and ornament, now novelty and versatility of treatment, or affected simplicity and studied absence of plan. But the chief weapon is the epigram (*sententia*), summing up in terse incisive antithesis the gist of a whole period. "Seneca is a man of real genius," writes Niebuhr, "which is after all the main thing; not to be unjust to him, one must know the whole range of that literature to which he belonged and realize how well he understood the art of making something even of what was most absurd." His works were upon various subjects. (1) His *Orationes*, probably the speeches which Nero delivered, are lost, as also a biography of his father, and (2) his earlier scientific works, such as the monographs describing India and Egypt and one upon earthquakes (*Nat. Qu.*, vi. 4, 2). The seven extant books of *Physical Investigations* (*Naturalium Quæstiones*) treat in a popular manner of meteorology and astronomy; the work has little scientific merit, yet here and there Seneca, or his authority, has a shrewd guess, e.g., that there is a connexion between earthquakes and volcanoes, and that comets are bodies like the planets revolving in fixed orbits. (3) The *Satire on the Death* (and deification) of *Claudius* is a specimen of the "satira Menippea" or medley of prose and verse. The writer's spite against the dead emperor before whom he had cringed servilely shows in a sorry fashion when he fastens on the wise and liberal measure of conferring the franchise upon Gaul as a theme for abuse. (4) The remaining prose works are of the nature of moral essays, bearing various titles,—twelve so-called *Dialogues*, three books *On Clemency* dedicated to Nero, seven *On Benefits*, twenty books of *Letters to Lucilius*. They are all alike in discussing practical questions and in addressing a single reader in a tone of familiar conversation, the objections he is supposed to make being occasionally cited and answered. Seneca had the wit to discover that conduct, which is after all "three-fourths of life," could furnish inexhaustible topics of abiding universal interest far superior to the imaginary themes set in the schools and abundantly analysed in his father's *Controuersiae* and *Suasoriae*, such as poisoning cases, or tyrannicide, or even historical persons like Hannibal and Sulla. The innovation took the public taste,—plain matters of urgent personal concern sometimes treated casuistically, sometimes in a liberal vein with serious divergence from the orthodox standards, but always with an earnestness which aimed directly at the reader's edification, progress towards virtue, and general moral improvement. The essays are in fact Stoic sermons; for the creed of the later Stoics had become less of a philosophical system and more of a religion, especially at Rome, where moral and theological doctrines alone attracted lively interest. The school is remarkable for its anticipation of modern ethical conceptions, for the lofty morality of its exhorta-

tions to forgive injuries and overcome evil with good; the obligation to universal benevolence had been deduced from the cosmopolitan principle that all men are brethren. In Seneca, in addition to all this, there is a distinctively religious temperament, which finds expression in phrases curiously suggestive of the spiritual doctrines of Christianity. Yet the verbal coincidence is sometimes a mere accident, as when he uses *sacer spiritus*; and in the same writings he sometimes advocates what is wholly repulsive to Christian feeling, as the duty and privilege of suicide.

Eight of the tragedies which bear Seneca's name are undoubtedly genuine. In them the defects of his prose style are exaggerated: as specimens of pompous rant they are probably unequalled; and the rhythm is unpleasant owing to the monotonous structure of the iambs and the neglect of synapheia in the anapaestic systems. The pretexta *Octavia*, also ascribed to him, contains plain allusions to Nero's end, and must therefore be the product of a later hand.

Our materials for a knowledge of Seneca are ample, and are variously presented in such works as Merivale's *Romans under the Empire*, cc. 52-54; Zeller's *Greek Philosophy* (Eng. tr. *Eclecticism*, pp. 202-245); and the histories of Roman literature by Bernhardt, Teuffel (§§ 282-288), and Simcox (ii. pp. 1-27, London, 1883). His elder brother Annaeus Seneca Novatus, afterwards adopted by a Junius Gallio, was the proconsul of Achaia before whom St Paul pleaded (Acts xviii. 12). The date of Seneca's birth must be approximately inferred from *Nat. Qu.*, i. 1, 8; *Ep.*, 108, 22. His mother's name was Helvia; her sister brought him as a child to Rome and nursed him tenderly. His teachers were Attalus, a Stoic, and Sotion, a pupil of the Sextili. In his youth he was a vegetarian and a water-drinker, but his father checked his indulgence in asceticism. Before his exile he had served as quaestor, was married, and had two children born. Caligula said his style was mere mosaic (*commissuras metras*) or "sand without lime," and would have put him to death, had he not been assured that so consumptive a subject could not last long (Suet., *Calig.*, 68; Dio Cassius, lxx. 19, 7). Upon a Pompeian fresco a butterfly appears as charioteer of a dragon,—Seneca and Nero. His second wife was Pompeia Paulina, of noble family; she attempted to die with him. His enormous wealth was estimated at 300 millions of sesterces. He had 500 ivory tables inlaid with citron wood (Dio, lxi. 10, lxii. 2). The judgment of Tacitus (*Ann.*, xiii. 4, 18, 42 sq., xiv. 52-56, xv. 60 sq.) is more favourable than that of Dio, who may possibly derive his account from the slanders of some personal enemy like Silius. Seneca has found many champions—Lipsius (the introduction to his ed.); Diderot, *Essai sur les Règnes de Claude et de Néron* (iii. 1-407, Paris, 1875); Volquardsen, *Ehrenrettung* (Hadersleben, 1839); Martha, *Les Moralistes sous l'Empire Romain* (2d ed., Paris, 1868). For the dates of his works, see H. Lehmann, in *Philologus*, viii. p. 309; F. Jonas, *De ordine librorum Sen.* (Berlin, 1870); A. Martens, *De Sen. vita* (Altona, 1871); also R. Volkmann, in *Mager's Pädagog. Revue*, xviii. pp. 259-276 (1857). At least eighteen prose works have been lost, among them *De superstitione*, an attack upon the popular conceptions of the gods, and *De matrimonio*, which, to judge by the extant fragments, must have been interesting reading. Since Gellius (xii. 2, 3) cites a book xxii. of the *Letters to Lucilius*, some of these have been lost. His style is elaborately criticized by Quintilian (*Inst.*, x. 1, 125-131), also by Fronto (p. 155 sq.; Gellius, xii. 2, 1). The doubt as to his authorship of the tragedies is due to a blunder of Sideronius Apollinaris (ix. 229-231); against it must be set Quintilian's testimony ("ut Medea apud Senecam," ix. 2, 8). Some of the Fathers, probably in admiration of his ethics, reckoned Seneca among the Christians; this assumption in its turn led to the forgery of a correspondence between St Paul and Seneca, which was known to Jerome (comp. Augustin, *Ep.*, 158: "Seneca . . . cuius etiam ad Paulum apostolum leguntur epistolae"). This has given rise to an interesting historical problem, most thoroughly discussed in the commentary on the *Ep. to the Philippians* by Dr Lightfoot, bishop of Durham (London, new ed., 1879, pp. 270-338), who cites (p. 278 note) among earlier authorities A. Fleury, *St Paul et Sénèque* (Paris, 1858); C. Aubertin, *Étude* (1858), also new ed. *Sénèque et St Paul* (Paris, 1870); F. C. Baur (1858), republished in *Drei Abhandlungen* (Leipzig, 1876); F. W. Farrar, *Seekers after God* (London, s.a.); and G. Boissier, in the *Revue des Deux Mondes*, xcii. 1871, pp. 40-71. Add the articles by F. X. Kraus in *Theolog. Quartalschrift*, vol. xlix. pp. 609-624 (Tübingen, 1867) and by A. Harnack in *Theolog. Lit.-Zeitung*, 1881, pp. 444-449, the latter being a review of E. Westerburg, *Untersuchung der Sage, dass Seneca Christ gewesen sei* (Berlin, 1881).

The best text of the prose works, that of Haase in Teubner's series (1852), was re-edited in 1873-74; he followed the critical labours of Fickert (Berlin, 3 vols., 1842-45). More recently Gertz has revised the text of *Libri de beneficiis et de clementia* (Berlin, 1876) and H. A. Koch that of the *Dialogorum libri XII.* (completed by Vahlen, Jena, 1879). There is no complete exegetical commentary, either English or German. Bücheler's edition of the *Ἀποκολοκύντως* may be found in *Symbola philol. Bonnens.*, i. (1864), pp. 81-89. Little has been done systematically since the notes of Lipsius and Gronovius. There is, however, Ruhkopf's ed. with Latin notes, 5 vols. (Leipzig, 1797-1811), and Lemaire's variorum ed. (Paris, 1827-32, 8 vols., prose and verse). The text of the tragedies was edited by Peiper and Richter for Teubner's series (1867), and more recently by F. Leo (Berlin, 2 vols., 1878-79). Nisard, *Études de mœurs et de critique sur les poètes de la décadence* (4th ed., Paris, 1878), has criticized them in detail. Of some 300 monographs enumerated in Engelmann may be mentioned, in addition to the above, G. Boissier, *Les tragédies de Sénèque ont-elles été représentées?* (Paris, 1861); A. Dörgeus, *Senec. disciplina moralis cum Antoniniana comparatio* (Leipzig, 1857); E. F. Gelpke, *De Senec. vita et moribus* (Bern, 1848); Holzner, *Der Philosoph Seneca* (Rastadt, 1858). (R. D. H.)

SENECA FALLS, a post village and township of the United States, in Seneca county, New York, 41 miles south-west of Syracuse by the Auburn division of the New York Central Railroad, occupies a beautiful situation on Seneca river, the outlet of Seneca Lake. It turns the water-power of the falls to account in the manufacture of steam fire-engines, fire-extinguishing apparatus, pumps, machinery, knit goods, flour, yeast, &c. The population of the village was 5880 in 1880 and of the township 6853.

SENEFELDER, ALOIS. See LITHOGRAPHY, vol. xiv. pp. 697-698.

SENEGAL, a river of western Africa, which falls into the Atlantic about 16° N. lat., 9 or 10 miles below St Louis. It is formed at Bafulabé¹ (13° 50' N. lat. and 10° 50' W. long.) by the junction of the Ba-fing or Black River and the Ba-khoy or White River. The Ba-fing, which has a width at the confluence of 1475 feet, descends from the highlands of Futa-Jallon by a northward course of about 350 miles, during which it passes by a series of rapids from the altitude of 2460 feet, at which it takes its rise, to that of 360 feet, and receives from the right the Nunkolo and the Funkumah (with its tributary the Bokfi). The Ba-khoy, 800 feet wide at the confluence, has been previously flowing from east to west and gives that general direction to the Senegal, but its source is away in the south-east behind the country of Buré. That of its principal tributary, the Ba-ule (Red River), is more to the east and lies within a few miles of the course of the Niger in the Mandingo plateau. Below Bafulabé the Senegal, flowing north-west, passes a succession of falls—those of Guina (160 feet) and of Felu (50 or 60)—and arrives at Médine, after having accomplished 440 of its total course of 1000 miles. It receives only two important affluents,—from the right the “marigot” of Kulu, which comes from Kuniakhary, draining the slopes of the Kaarta plateau, and from the left the Falemé, which rises in the Futa-Jallon between Labé and Timbo and flows north-west in a permanent stream. Below Médine the Senegal presents a series of great reaches, which become more and more navigable as they approach the sea.

From the 1st of August to the 1st of October it is open as far as Médine to vessels not drawing more than 8 feet. Between Médine and Bakel (85 miles) there are twenty-seven “narrows,” of which several, such as that at Kayes, are difficult; it is on this account that a railway has been projected between Kayes and the Niger. At Bakel below the confluence of the Falemé the river is navigable till the 1st of December, from Bakel to Saldé between the 15th of July and the 15th of December, and lastly from Mafu to the sea for a distance of 215 miles it is navigable all the year round. Outside the limits indicated navigation between Mafu and Médine is often precarious even for barges drawing little over a foot, and above Médine, though some reaches are deep enough, troublesome transhipments are necessary between reach and reach. Between Mafu and Saldé the Senegal changes its direction from north-west to west, and shortly before reaching the sea to south-west. The bar at the mouth can usually be crossed by vessels not drawing more than 10 feet, or at high tides a little more. Below Bakel the river becomes tortuous and encloses the great island of Morfil, 110 miles long, and a series of other islands, of which one is occupied by St Louis. At this point the right branch of the river is only 500 feet from the sea, but the dunes along the coast turn it south for other 9 miles. The scantiness of its sources, the steepness of its upper course, and the rapid evaporation which takes place after the short rainy season would soon dry up the river-system of the Senegal, especially in the upper regions; but natural dams cross the channel at intervals and the water accumulates behind them in deep reaches, which thus act as reservoirs. In the rainy season the barriers are submerged in succession, beginning with the farthest up, the reaches are filled, and the plains of the lower Senegal are changed into immense marshes. Like Lake Moeris in antiquity on the Nile and the lake of Cambodia at the present time on the Me-kong, Lake Cayor on the right side of the lower Senegal and Lake Panieful on the left constitute reserve basins, receiving the surplus waters of the river during flood and restoring them in the dry season. For months together the latter forms the only drinking pond for the wild beasts of the surrounding country,—lions, elephants, leopards, panthers, ounces, cheetahs, hyenas, lynxes, giraffes, antelopes, gazelles, monkeys, jackals visiting it in crowds. In the upper part of the river the reservoirs are successively emptied to the level of the dams and receive no more water except from the permanent springs; but they are partially protected by curtains of verdure from the effects of the evaporation which makes itself so severely felt on the treeless seaboard. Owing to these natural “locks,” similar to those of an artificial canal, the Senegal river never discharges less than 1700 or 1800 cubic feet per second. The lower Senegal forms the boundary between the dry and barren Sahara and the rich and productive region of the western Sudan; the line of its inundations is an ethnographic march between the nomadic Moor and the settled Negro.

¹ Bafulabé is a native word for “confluence.”

SENEGAL,² a French colony of western Africa, composed of lines of fortified posts and a loose agglomeration of states and territories in various degrees of subjugation. The forts extend (a) from St Louis at the mouth of the Senegal to Bammako on the Niger,³ (b) along the coast of the Atlantic between St Louis and the mouth of the Salum to the south of Cape Verd, and (c) along the so-called rivers of the south which fall into the ocean between the Gambia and SIERRA LEONE (*q.v.*). French influence is fully dominant along those lines either in the form of actual territorial possession or of a recognized protectorate.⁴

The colony is ruled by a governor, sends a deputy to the French legislature, and elects a general council of sixteen members, ten for the electoral district of St Louis, four for that of Gorée-Dakar, and two for that of Rufisque. The three communes just named have each its municipal council. The population of those French possessions was in 1884 197,644,—46,364 urban, 143,200 rural, 8080 “floating.” In the whole number there were only 1474 Europeans, of whom 1461 were French. The population of the protected countries cannot be ascertained. The most important places in the colony are St Louis (18,924 inhabitants in 1883), Dagana (5375), Rufisque (4244), Médine (3000), Joal (2372), Gorée and Dakar (each 2000). The colony has only a single true port, that of Dakar to the east of the peninsula of Cape Verd, since 1885 connected with St Louis by a railroad, 163 miles long, and visited by Atlantic steamers on their way from France to South America. Rufisque and Gorée have open roadsteads, where vessels anchor at some distance from the shore. The port of St Louis in the Senegal is difficult of access owing to the bar, but it is the only place where vessels can repair serious damages. The principal commercial centres are St Louis (imports and exports), Gorée (exports), and Rufisque (exports). The upper Senegal sends ground-nuts (known as Galam nuts), gum, millet, leather, and receives in exchange blue calico (guinée) from India, England, and Belgium, various other cotton stuffs, cotton yarn, guns and ammunition, tobacco, crushed rice, sugar (raw and refined), molasses, biscuits, tinsmiths’ wares, &c. The colony also imports Swedish iron, which is manufactured by the native blacksmiths into agricultural implements, knives, daggers, and spearheads. Cayor sells its ground-nuts for money. The rivers of the south district export ground-nuts, palm kernels, india-rubber, leather, coffee, in return for English and Belgian blue calico, Hamburg brandy, English gunpowder, English and Belgian guns, and American tobacco. An English firm has twenty-three factories on the Rio Nuñez, and others on the Rio Pongo and the Mellacorée. The total value of the exports and imports of the colony was £1,325,711 in 1879, £1,774,089 in 1880, and £1,888,657 in 1883, the imports slightly preponderating over the exports. The value of the ground-nuts exported in 1883 was £700,000, that of the gums only £120,000; and the ground-nut trade is still rapidly developing. The imports comprise French

² For the physical geography, &c., see SENEGAMBIA.

³ Along this line lie Richard Toll, Dagana (founded in 1821), Podor (1743 and 1854), Saldé (1859), Matam (1857), Bakel (1820), Kayes, Médine (1855), and Bafulabé (1879) on the Senegal, and between this river and the Niger the forts of Badumbé and Tukota on the Ba-khoy, Kita (1881), Kondu (1882), Niagassola (1884-85), and lastly Bammako (1883) or Bammaku, on the Niger.

⁴ ARRONDISSEMENT I.—On the circle of *Bakel* depend the post of Matam, the protected countries of Danga (1859), Gnoy, Kamera, Guidimakha, Bondou, and Bambuk; on the circle of *Médine*, Khasso, Logo, and Natiaga; on the circle of *Bafulabé*, Barinta, Makadugu, Beteadugu, Farimbula, Bafing; on the circle of *Kita*, the province of Kita and Fuladugu; on the circle of *Bammako*, Birgo and Little Beledugu. This arrondissement is under the command of a superior officer resident at Kayes. ARRONDISSEMENTS II., III.—These are formed by Lao and Toro (1863), protected countries attached to the circle of *Saldé*; the circle of *Podor*, which comprises the French portion of Toro and a fragment of Dimar; the circle of *Dagana*, on which depend the other portion of Dimar and a portion of Walo; the suburban district of St Louis, including the other portion of Walo, Ross, Merinaghen, the cantons of Gandiole, M’pal, Khattet, Gondou, Dialakhar, N’diogo, and Tubé; N’diambor and Merina N’guick, separated from Cayor and placed under French protection, as well as the kingdoms of Cayor and Baol; the suburb of Dakar with the island of Gorée, the cantons of Rufisque and the circles of *M’bijem*, *Thies*, *Portudal*, and *Joal*. ARRONDISSEMENT IV.—The Rivers of the South district constitutes the fourth arrondissement under a lieutenant-governor, and comprises the circle of *Kaolack* or *Salum*; those of *Carabane* and *Sedhiu* on the Cazamance, with the protected countries of Pakao, Balmadu, Suna, Yacine, Firdu; the circle of *Rio Nuñez* formed by the Nalus and Landuman tribes; the circle of the *Rio Pongo* with the country of the Susus; the circle of *Mellacorée* with the protected countries of Samo, Kaback, Kabita, Kalum, Tabussu, Maneah, Correra, and the island of Tombo.

goods £360,000, goods passing as French £200,000, foreign goods £440,000, of which £240,000 represent English, £200,000 Belgian, £120,000 German, £80,000 American articles. In 1882 946 vessels entered and 960 cleared. The budget for the colony in 1884 was £100,320, for the communal expenses £14,560, and for the expenses of the capital £250,000.

History.—The navigators of Dieppe are said to have discovered the Senegal about 1360. The Portuguese had some establishments on its banks in the 15th century; and the first French settlements were probably formed in the latter part of the 16th or beginning of the 17th century. Between 1664, when these French settlements were assigned to Colbert's West India Company, and 1758, when the colony was seized by the English, Senegal had passed under the administration of no fewer than seven different companies, none of which attained any great success, though from 1694 to 1724 affairs were conducted by a really able governor, André Brué. In 1677 the French captured from the Dutch Rufisque, Portudal, Joal, and Gorée, and they were confirmed in possession of these places by the treaty of Nimeguen (1678). In 1717 they acquired Portendic and in 1724 Arguin on the coast of the Sahara, which still belong to the colony. Gorée and the district of Cape Verd were surrendered by the English to the French in 1763, and by the treaty of peace in 1783 the whole of the Senegal was also restored; but the English again captured the colony in the wars of the first empire (Gorée 1800, St Louis 1809), and, though the treaty of Paris authorized a complete restitution, the French authorities did not enter into possession till 1817. Between that date and 1854 little was effected by the thirty-seven governors who succeeded each other at St Louis; but in this year the appointment of General Faidherbe proved the turning-point in the history of Senegal. He at once set about subduing the Moorish (Berber) tribes of the Trarzas, Braknas, and Duaiush, whose "kings," especially the king of the Trarzas, had subjected the French settlers and traders to the most grievous and arbitrary exactions; and he bound them by treaty to confine their authority to the north bank of the Senegal. In 1855 he annexed the country of Walo and erected the fort of Médine in the country of Khasso. This last was a bold stroke for the purpose of stemming the advancing tide of Moslem invasion, which under Omar al-Hadji (Alegui) threatened the safety of the colony. In 1857 Médine was brilliantly defended by the mulatto Paul Holle against Omar, who with his army of 20,000 men had to retire before the advance of General Faidherbe and turn his attention to the conquest of the native states of the Sudan. By treaty of 1860 Omar recognized the French claim to half of Bambuk, half of Khasso, Bondou, Kamera, Guoy, Guidimakha, Damga, Futa-Toro, Dimar, &c. Since then annexations and protectorates have followed in rapid succession under the governorships of Jauréguiberry, Faidherbe, and Brière de l'Isle. It is sufficient to mention the treaties of 1881 and 1885 by which the confederation of Futa-Jallon and Buré respectively recognized a French protectorate.

Soc. de Géogr.*, Paris, 1854; *Sénégal et Niger, la France dans l'Afrique Occidentale*, 1879-83, published by the Ministry of Marine, 1884; Faidherbe, *Le Soudan français*, Lille, 1881-85; *Notices Coloniales pub. à l'occasion de l'Exposition d'Anvers*, 1885; *Annales Sénégalaises de 1856 à 1885, suivies des traités passés avec les indigènes*, 1886; and Rambaud, "Sénégal et Soudan Français," in *Revue des Deux Mondes*, 1885.

SENEGAMBIA, a country in the west of equatorial Africa, comprising, as the name indicates, the regions watered by the Senegal and the Gambia. It lies between 9° and 17° N. lat. and 6° and 17° 30' W. long., being bounded on the N. by the Sahara, W. by the Atlantic, S. by Sierra Leone, and E. by the Joliba or upper Niger. The area is estimated at about 400,000 square miles. Accepting the course of the Senegal and its right hand affluent the Ba-ule as the boundary towards the Sahara, the Joliba as the frontier towards Segu and Upper Guinea, and the watershed between the Mellacorée (Mellicoury) and the Great Scarcies as that between Senegambia and Sierra Leone, we have only for short distances to fall back on a mere conventional delimitation,—in the north between Sidian on the Ba-ule and Sansanding on the Niger *via* Murdia; in the south-east, from Sansanding to a point above Nyamina; and finally between the Joliba and the sources of the Great Scarcies. The Senegambian coast extends south-south-west almost in a straight line from the N'diadier or Mosquito lagoon (Marigot des Maringouins), formerly the northern mouth of the Senegal, to Cape Verd, the most western point of the African continent; then it bends south as far as Cape Roxo; and

afterwards south-east as far as the Mellacorée. With the exception of the two great capes just mentioned, the only headlands of any importance are Cape St Mary, forming the south side of the estuary of the Gambia; Cape Verga, between Rio Nuñez and Rio Pongo; and Konakry Point, opposite the Los (or Idolos) Islands. The only gulf on the whole coast is that which lies to the south of Cape Verd and contains the island of GORÉE (*q.v.*); the other inlets, such as the bay of Sangareah, are mere estuaries or river mouths. Apart from the island in the Senegal on which St Louis is built and those formed by the deltas of the rivers, the only islands along the coast are Gorée, the Bissagos (or Bijug) Archipelago, the Los Islands, and the

Map of Senegambia.

little island of Matakong. The coast in the northern part has the same appearance as that of the Sahara,—low, arid, desolate, and dune-skirted, its monotony relieved only here and there by cliffs and plateaus. Farther south it becomes low, marshy, and clothed with luxuriant vegetation. Behind the low flat seaboard the country rises into a vast Interior plateau terminating eastwards in a mountainous region. Though of no great height, these mountains cover a large area and have numerous ramifications. Farther to the east they sink abruptly towards the Niger valley, while southwards they are prolonged towards Sierra Leone and the interior of Upper Guinea, perhaps forming those Kong Mountains which are said to exist between the ocean and the Niger basin. Under the name of Mounts Badet, Yandi, Maté, Kissi (of which the first form the "Alps" of Futa-Jallon) they descend on the west by a series of terraces to the plains of Senegambia, and on the north: they extend to the left bank of the Senegal and even throw out some spurs into the desert beyond. The mountain region is cut by numerous erosion valleys. As to the general altitude nothing is accurately known, but the following points have been determined—Mount Daro, 4068 feet; Kuruworo, 3868; Warnani, 3799; Yenkina, 3560; Bogoma, 3524; Pampaya, 3290. The principal rivers are the Senegal, the Salum, the Yombas, the Gambia, the Casamance, the Cacheo, the Geba, the Rio Grande, the

Boundaries.

Coast.

Cassini, the Compony, the Rio Nuñez, the Rio Pongo, the Dubreka or Konakry, the Forecareah, and the Mellacorée. They all rise in the mountains of the interior or at the foot of the highlands and fall into the Atlantic. Their general direction is from east to west with a south-west deflexion, which becomes always more pronounced as we advance southwards. Unlike these rivers, the Joliba or NIGER (*q.v.*), flowing north and north-east, soon passes beyond Senegambia. Lagoons and backwaters are common; but there are no true lakes of any importance.

Geology. The geological constitution of the country is as yet very imperfectly known, especially in the interior. The low region of the seaboard has a very uniform character. It consists of sandstones or clay rocks and loose beds of reddish soil containing marine shells. At certain points, such as Cape Verd and Cape Roxo, the sandstones crop out; it is the red colour of the sandstone in fact which has given Cape Roxo or Cap Rouge its name. Clay slates also occur, and at intervals these sedimentary strata are interrupted by basaltic amygdaloid and volcanic rocks. For instance, the island of Gorée is basaltic; the Bissagos (Bissão) Islands are composed of scoriae and other volcanic products; and a great part of the coast to the north of Rio Nuñez consists of basaltic and amygdaloid rocks. The base of the mountains is formed in certain places of clay slate, but more generally of granite, porphyry, syenite, or trachyte. In those districts mica schists and iron ores occur. Iron and gold are found in the mountains and the alluvial deposits. The streams also carry down gold dust. Many of the valleys are covered with fertile soils and there is generally a fertile belt along the river sides; but the rest of the country is rather arid and sterile.

Climate. The climate is far from being so unhealthy as is frequently asserted. Except when yellow fever is raging, Europeans may live there as satisfactorily as at home. There are two seasons, the dry season and the rainy season or winter, the latter contemporaneous with our summer. Along the seaboard the dry season is cool and agreeable; in the interior it is mild only for the three months which correspond to our winter, and then it becomes a time of intolerable heat. The annual temperature increases as we advance south and more rapidly as we advance east into the interior, except, of course, where an ascent is made to higher altitudes. To the south of Cape Verd the changes of temperature become less and less marked; Bissão has a more equable climate than Gorée. Eastwards the monthly range of the thermometer becomes more extensive. The maximum readings, which are exceptional at St Louis, become almost the rule at Bakel on the upper Senegal and at MacCarthy on the Gambia. In the north, on the banks of the Senegal, the north-east trade-winds blow for eight months of the year, the daily land and sea breezes which cool the atmosphere along the seaboard not being felt far inland. During the other four months there prevails a gentle south-west monsoon accompanied with frequent calms, storms, tornadoes, and rains. Southwards along the coast the trade-winds gradually decrease in both strength and duration, while the south-west monsoon becomes more powerful and persistent. The rainy season begins at Gorée between 27th June and 13th July, on the Gambia about 20th June, on the Casamance about the end of May, at the Bissagos Archipelago about the middle of May, and on the Rio Nuñez at the end of April. During this season Senegambia, drenched by heavy rains brought from the ocean, has everywhere one uniform appearance. The mean temperature is throughout very close on 81° Fahr. and the range of the thermometer is extremely limited. The rivers overflow and flood the lowlands. Storms are frequent. Vegetation displays its fullest energy. The fever exhalations are unfortunately also at their worst. At St Louis, Gorée, Dagana, and all along the Senegal there are 35 days of rain, a slight increase being apparent in the upper course of the river. At St Mary's, Bathurst, there are 48 days, at Sedhiu 84, at Bissão 111, at Boké 137,—a steady increase as we approach the equator. The number of storms follows almost the same ratio of increase, and showers which last two or three hours at St Louis give place to whole days of rain on the Casamance and the Rio Nuñez.

Flora. The king of the Senegambian trees is the baobab (*Adansonia digitata*), which sometimes at the height of 24 feet has a diameter of 34 feet and a circumference of 104. Acacias are very numerous, one species, *A. Adansonia*, being indeed the commonest of all Senegambian trees and valuable for its ship-timber. Among the palm-trees the *ronier* deserves to be mentioned, as the wood resists moisture and the attacks of insects; in some places, as in Cayor, it forms magnificent forests. The wood of the calcedra (*Khaya senegalensis*), a tall tree, is used in joiner's work and inlaying, and its bark furnishes a bitter tonic. The mampatas grows sometimes 100 feet high, its branches beginning only at a height of about 25 feet. The tree producing the famous kola-nut¹ grows on the banks

¹ A very complete account of this nut will be found in Nachtigal, *Sahara und Sudan*.

of the southern streams. It is almost needless to mention the m'bilor, the gonat, the mimosa, fig-trees, orange-trees, cocoa-palms, mango-trees, pomegranates, sycamores, and so on. The dimb, the neteru, the tiamanoi, the dimbgon, the gologne, the n'tabo yield edible fruits. The cultivated plants are millet, rice, tobacco, haricots, ground-nuts, indigo (wild indigo is also abundant), cotton (also found wild), maize, sugar-cane, and the butter-tree or karité.

The Senegambian lion is quite different from the Barbary lion: *Fauna*. its colour is a deeper and brighter yellow, and its mane is neither so thick nor so long. Other beasts of prey are the leopard, the wild cat, the cheetah, the civet, and the hyæna. The wild boar is clumsier than the European variety. Antelopes and gazelles occur in large herds all through upper Senegambia; the giraffe is common in the region of the upper Senegal; the elephant is rare; the hippopotamus is gradually disappearing. Crocodiles swarm both in the upper Senegal and the upper Niger. Monkeys and apes of different species (the chimpanzee, the colobus, the cynocephalus, &c.), the squirrel, rat, and mouse abound. The hedgehog, marmot, porcupine, hare, rabbit, &c., are also met with. Among the more noteworthy birds are the ostrich, which migrates to the Sahara; the bustard, occurring in desert and uncultivated districts; the marabout, a kind of stork, with its beak black in the middle and red at the point, which frequents the moist meadow-lands and the lagoons; the brown partridge, the rock partridge, and the quail in the plains and on the mountain sides; and the guinea-fowl in the thickets and brushwood. Along the coast are caught the sperm whale, the manatee, and the cod-fish. The domestic animals are the horse, ass, ox, sheep, goat, dog, and camel.

The population of Senegambia cannot be ascertained with any Popula- approach to accuracy, but it may be roughly stated at from ten to twelve millions. It comprises three distinct races,—the Moor, the Negro, and the European. The Moors, or rather Berbers (Trarzas, Braknas, and Duaish), belong strictly to the right bank of the Senegal and appear in Senegambia only exceptionally. The Negroes form the bulk of the population. They are divided into Poul, Fulbe, Fulah, or Fellatah, Toucouleurs, Mandingoes, Sarakolés, Wolofs, Sereres, Diolas, Bambaras, Balantes, Biafares, Papels, Nalus, Landumans, Bagas, and Susus. The Poul inhabit Futa, Damga, Bondu, and Futa-Jallon; they have a reddish complexion and almost straight hair, their body fairly stout, but their limbs slim. They are gentle and hospitable, but addicted to theft. The Toucouleurs, Poul half-breeds, belonging originally to Futa-Jallon, are similar to the Negro proper; they are treacherous, warlike, fond of plunder, and fanatical in their Mohammedanism. The Mandingoes or Malinkés inhabit the basins of the upper Niger and the upper Senegal and the western slope of the mountains of Futa-Jallon. They comprise the Mandingo proper, occupying Manding, and the Malinkés and Soninkés, scattered about Bambuk, Buré, and Fuladugu. Under the name of Wakore or Wangara they are also found in all the immense tract which extends to the north of the Kong Mountains. They are tall of stature and of great muscular strength. The Sarakolés are one of the branches of the Bambara race produced by crossing with the Poul. Their character is mild and pacific. Scattered about in Guoy, Kamera, and Guidimakha, they are fond of trade and engage in it with activity. The Wolofs and the Sereres inhabit the seaboard from St Louis to Cape Verd and the left bank of the Senegal from its mouth to Richard Toll and Dagana. They are tall and robust, with black and glossy skin. Most of them are fetishists. The Diolas have flat noses, thick lips, harsh features, and a prominent belly; the body is tattooed. The Bambaras, who have invaded Kaarta and Khasso, have a coppery black complexion and frizzly hair; their cheeks are marked with deep scars. The Balantes inhabit the left bank of the Casamance; they are as cruel and as fond of pillage as the Mandingoes, but are more generous towards the vanquished. The Biafares live on the banks of the Rio Grande and the Papels in the valley of the Cacheo and the Geba. The Nalus and the Landumans are tributary to the French ports of the Rio Nuñez and the Rio Pongo. Islam is gradually detaching them from fetishism. The Bagas occupy the coast between the Rio Nuñez and the Rio Pongo. The Susus formerly dwelt on the upper Niger, but they were expelled by the invasion of the Mohammedans and are at the present time settled in the valley of the Rio Pongo. The principal languages of Senegambia are Wolof, Poul, Sereres, Mandingo, and Arabic. Wolof is spoken in a large part of Senegambia, in Wolof, Walo, Cayor, Dakar, Baol, Sine, Salum, and in the towns of St Louis and Gorée. The river Senegal marks the line of separation between Wolof and Arabic. Poul is the language of the Poul and the Toucouleurs; Mandingo comprises several dialects,—Malinké, Soninké, Bambara. The few Europeans are mainly civil and military officials or traders. White planters are rare. The natives of Senegambia are generally divided into two quite distinct classes,—freemen and slaves. The griots are a kind of bards or trouvères who live at the expense of those whose praises they sing. Polygamy is generally practised. Circumcision of the adults of both sexes is a rite accompanied with superstitious

observances. Every canton, every village in independent Senegambia is governed either by a chief ("king") or by an "almamy" elected by a group of villagers.

History.

Senegambia is divided into French Senegambia (with the territories placed under French protection), English Senegambia, Portuguese Senegambia, and independent Senegambia, comprising the native states not under the protection of a European power. French Senegambia is called the colony of SENEGAL (q.v.). English Senegambia comprises the establishments of the GAMBIA (q.v.) and the islands of Los. Portuguese Senegambia consisted till quite recently of Bissagos Archipelago and the "factories" of Zighinchor on the Casamance, Cacheo and Farim on the Rio Cacheo, and Geba on the Geba. By an arrangement effected in 1886 Portugal ceded Zighinchor to France in exchange for Massabé on the Loango coast. Germany, which seemed at one time disposed to place various territories of Dubreka, Koba, and Kabitai under its protection, has formally abandoned the plan. The independent states are not very numerous, but for the most part they are more extensive than the protected countries. They were quite recently—Jolof, lying between the Senegal and the Gambia in one direction and between the Falemé and the ocean in the other; Buré in the Mandingo region, a territory abounding in gold; Guidimakha in Gangara, on the right bank of the Senegal. There still remain among the more important Kaarta, the country of Segu, and Futa-Jallon.

Communication.

Several lines of English, French, and German packets call at the Senegambian ports, and small steamers ascend the navigable portions of the rivers. A railway unites St Louis and Dakar, and another line is being constructed from Kayes to Bafoulabé (on the upper Senegal), with a projected extension to Bamako. There is telegraphic communication between Dakar and St Louis, and a second line puts all the ports of the upper Niger and the left bank of the Senegal into connexion with St Louis, which has touch of Europe by means of a submarine cable passing by way of the Canary Islands to Cadiz. The foreign trade of Senegambia consists in the exportation of gums, ground-nuts, sesame, oil, india-rubber, birds' feathers, hides, wax, and ivory, coffee from the Rio Nuñez, and rice from the Casamance, and the importation of iron, alcoholic liquors, firearms, ammunition, coral, beads, tobacco, preserved foods, and blue calico (guinée).

Trade.

(D. K*.)

SENIOR, NASSAU WILLIAM (1790-1864), English political economist, was born at Compton, Berks, on 26th September 1790, the eldest son of the Rev. J. R. Senior, vicar of Durnford, Wilts. He was educated at Eton and Magdalen College, Oxford; at the university he was a private pupil of Richard Whately, afterwards archbishop of Dublin, with whom he remained connected by ties of lifelong friendship. He took the degree of B.A. in 1811, was called to the bar in 1819, and in 1836, during the chancellorship of Lord Cottenham, was appointed a master in chancery. On the foundation of the professorship of political economy at Oxford in 1825, Senior was elected to fill the chair, which he occupied till 1830, and again from 1847 to 1852. In 1830 he was requested by Lord Melbourne to inquire into the state of combinations and strikes, to report on the state of the law, and to suggest improvements in it. He was a member of the Poor Law Inquiry Commission of 1832, and of the Handloom Weavers Commission of 1837; the report of the latter, published in 1841, was drawn up by him, and he embodied in it the substance of the report he had prepared some years before on combinations and strikes. He was also one of the commissioners appointed in 1861 to inquire into popular education in England. In the later years of his life, during his visits to foreign countries, he studied with much care the political and social phenomena they exhibited. Several volumes of his journals have been published, which contain much interesting matter on these topics, though the author probably rated too highly the value of this sort of social study. Senior was for many years a frequent contributor to the *Edinburgh Quarterly*, *London*, and *North British Reviews*, dealing in their pages with literary as well as with economic and political subjects. He died at Kensington on 4th June 1864.

His writings on economic theory consisted of an article in the *Encyclopædia Metropolitana*, afterwards separately published as *An Outline of the Science of Political Economy* (1836, 3d ed. 1854), and his lectures delivered at Oxford. Of the latter the following were printed—*An Introductory Lecture* (1827, 3d ed. 1831); *Two Lec-*

tures on Population, with a correspondence between the author and Malthus (1831); *Three Lectures on the Transmission of the Precious Metals from Country to Country, and the Mercantile Theory of Wealth* (1828); *Three Lectures on the Cost of obtaining Money and on some Effects of Private and Government Paper Money* (1830); *Three Lectures on Wages and on the Effects of Absenteeism, Machinery, and War, with a Preface on the Causes and Remedies of the Present Disturbances* (1830, 2d ed. 1831); *A Lecture on the Production of Wealth* (1847); and *Four Introductory Lectures on Political Economy* (1852). Several of his lectures were translated into French by M. Arrivabène under the title of *Principes Fondamentaux d'Économie Politique* (1835). Senior also wrote on administrative and social questions—*A Letter to Lord Howick on a Legal Provision for the Irish Poor, Commutation of Tithes, and a Provision for the Irish Roman Catholic Clergy* (1831, 3d ed. 1832, with a preface containing suggestions as to the measures to be adopted in the "present emergency"); *Statement of the Provision for the Poor and of the Condition of the Labouring Classes in a considerable portion of America and Europe, being the Preface to the Foreign Communications in the Appendix to the Poor Law Report* (1835); *On National Property, and on the Prospects of the Present Administration and of their Successors* (anon.; 1835); *Letters on the Factory Act, as it affects the Cotton Manufacture* (1837); *Suggestions on Popular Education* (1861); *American Slavery* (in part a reprint from the *Edinburgh Review*; 1862); *An Address on Education delivered to the Social Science Association* (1863). His contributions to the reviews were collected in volumes entitled *Essays on Fiction* (1864); *Biographical Sketches* (1865, chiefly of noted lawyers); and *Historical and Philosophical Essays* (1865). In 1859 appeared his *Journal kept in Turkey and Greece in the Autumn of 1857 and the Beginning of 1858*; and the following were edited after his death by his daughter—*Journals, Conversations, and Essays relating to Ireland* (1868); *Journals kept in France and Italy from 1843 to 1852, with a Sketch of the Revolution of 1848* (1871); *Conversations with Thiers, Guizot, and other Distinguished Persons during the Second Empire* (1878); *Conversations with Distinguished Persons during the Second Empire, from 1860 to 1863* (1880); *Conversations and Journals in Egypt and Malta* (1882); also in 1872 *Correspondence and Conversations with Alexis de Tocqueville from 1834 to 1859*.

Senior's literary criticisms do not seem to have ever won the favour of the public; they are, indeed, somewhat formal and academic in spirit. The author, while he had both good sense and right feeling, appears to have wanted the deeper insight, the geniality, and the catholic tastes which are necessary to make a critic of a high order, especially in the field he chose,—that, namely, of imaginative literature. His tracts on practical politics, though the theses they supported were sometimes questionable, were ably written and are still worth reading, but cannot be said to be of much permanent interest. But his name will continue to hold an honourable, though secondary, place in the history of political economy. Senior regards political economy as a purely deductive science, all the truths of which are inferences from four elementary propositions. It is, in his opinion, wrongly supposed by J. S. Mill and others to be a hypothetical science,—founded, that is to say, on postulates not corresponding with social realities. The premises from which it sets out are, according to him, not assumptions but facts. It concerns itself, however, with wealth only, and can therefore give no practical counsel as to political action: it can only suggest considerations which the politician should keep in view as elements in the study of the questions with which he has to deal. The conception of economics as altogether deductive is certainly erroneous, and puts the science from the outset on a false path. But deduction has a real, though limited, sphere within it. Hence, though the chief difficulties of the subject are not of a logical kind, yet accurate nomenclature, strict definition, and rigorous reasoning are of great importance. To these Senior has given special attention, and, notwithstanding occasional pedantries, with very useful results. He has in several instances improved the forms in which accepted doctrines were habitually stated. He has also done excellent service by pointing out the arbitrary novelties and frequent inconsistencies of terminology which deface Ricardo's principal work,—as, for example, his use of "value" in the sense of "cost of production," and of "high" and "low" wages in the sense of a certain proportion of the product as distinguished from an absolute amount, and his peculiar employment of the epithets "fixed" and "circulating" as applied to capital. He shows, too, that in numerous instances the premises assumed by Ricardo are false. Thus he cites the assertions that rent depends on the difference of fertility of the different portions of land in cultivation; that the labourer always receives precisely the necessities, or what custom leads him to consider the necessities, of life; that, as wealth and population advance, agricultural labour becomes less and less proportionately productive; and that therefore the share of the produce taken by the landlord and the labourer must constantly increase, whilst that taken by the capitalist must constantly diminish; and he denies the truth of all these propositions. Besides adopting some terms, such as that of "natural agents," from Say, Senior

introduced the word "abstinence"—which, though obviously not free from objection, is for some purposes useful—to express the conduct of the capitalist which is remunerated by interest; but in defining "cost of production" as the sum of labour and abstinence necessary to production he does not seem to see that an amount of labour and an amount of abstinence are disparate, and do not admit of reduction to a common quantitative standard. He has added some important considerations to what had been said by Smith on the division of labour. He distinguishes usefully between the rate of wages and the price of labour. But in seeking to determine the law of wages he falls into the error of assuming a determinate wage-fund, and states as an economic truth what is only an identical proposition in arithmetic. Whilst entertaining such an exaggerated estimate of the services of Malthus that he extravagantly pronounces him "as a benefactor of mankind on a level with Adam Smith," he yet shows that he modified his opinions on population considerably in the course of his career, regards his statements of the doctrine with which his name is associated as vague and ambiguous, and asserts that, "in the absence of disturbing causes, subsistence may be expected to increase in a greater ratio than population." It is urged by Périn, and must, we think, be admitted, that by his isolation of economics from morals, and his assumption of the desire of wealth as the sole motive-force in the economic domain, Senior has, in common with most of the other followers of Smith, tended to set up egoism as the legitimate ruler and guide of practical life. It is no sufficient answer to this charge that he makes formal reserve in favour of higher ends. From the scientific side, Cliffe Leslie has abundantly proved the unsubstantial nature of the abstraction implied in the phrase "desire of wealth," and the inadequacy of such a principle for the explanation of economic phenomena. (J. K. I.)

SENLIS, a town of France, in the department of Oise, lies on the right side of the Nonette, a left-hand affluent of the Oise, 34 miles north-north-east of Paris by the Northern Railway on the branch line (Chantilly-Crépy) connecting the Paris-Creil and Paris-Soissons lines. In 1881 it had only 6870 inhabitants; but its antiquity, its historical monuments, and its situation in a beautiful valley, in the midst of the three great forests of Hallatte, Chantilly, and Ermènonville, render it interesting. Its Gallo-Roman walls, 23 feet high and 13 feet thick, are, with those of St Lizier (Ariège) and Bourges, the most perfect in France. They enclose an oval area 1024 feet long from east to west and 794 feet wide from north to south. At each of the angles formed by the broken lines of which the circuit of 2756 feet is composed stands or stood a tower; numbering originally twenty-eight, and now only sixteen, they are semicircular in plan, and up to the height of the wall are unpierced. The Roman city had only two gates; the present number is five. The site of the prætorium was afterwards occupied by a castle occasionally inhabited by the kings of France from Clovis to Henry IV. and still represented by ruins dating from the 11th, 13th, and 16th centuries. In the neighbourhood of Senlis the foundations of a Roman amphitheatre, 138 feet by 105, have also been discovered. The old cathedral of Notre Dame (12th, 13th, and 16th centuries) was begun in 1155 on a vast scale; but owing to the limited resources of the diocese progress was slow and the transept was finished only under Francis I. The total length is 269 feet, but the nave (98 feet high) is shorter than the choir. At the west front there are three doors and two bell towers. The right-hand tower (256 feet high) is very striking: it consists, above the belfry stage, of a very slender octagonal drum with open-work turrets and a spire with eight dormer windows. The left-hand tower, altered in the 16th century, is crowned by a balustrade and a sharp roof. In the side portals, especially in the southern, the flamboyant Gothic is displayed in all its delicacy. Externally the choir is extremely simple. In the interior the sacristy pillars with capitals of the 10th century are noteworthy. The episcopal palace, now an archaeological museum, dates from the 13th century; the old collegiate church of St Frambourg was rebuilt in the 12th century in the style which became characteristic of the "saintes chapelles" of the 13th and 14th centuries; St Pierre, though enclosed by cavalry barracks, has preserved

its two towers. The ecclesiastical college of St Vincent, occupying the old abbey of this name, has a very elegant church, the date of which has been greatly disputed by archaeologists, who sometimes wrongly refer it to Queen Anne of Russia. The town-house and several private houses are also of architectural interest.

Senlis can be traced back to the Gallo-Roman township of the Silvanectes which afterwards became Augustomagus. Christianity was introduced by St Rieul at the close of the 3d century. During the first two dynasties of France Senlis was a royal residence. After the dismemberment of the Carolingian empire it belonged to the counts of Vermandois and then to the royal domain, and obtained a communal charter in 1178. Its bishop, Guérin, elected in 1214, signalized himself at the battle of Bouvines. The burgesses took part in the Jacquerie of the 14th century, then sided with the Burgundians and the English, whom, however, they afterwards expelled. The Leaguers were there beaten by the duke of Longueville and La Noue. In the time of Henry IV. the local manufactures employed 200 masters and 4000 men, but all industrial activity has now disappeared. The bishopric was suppressed at the Revolution, and this suppression was confirmed by the Concordat.

SENNA (Arab. *sanā*), a popular purgative, consisting of the leaves of two species of *Cassia*, viz., *C. acutifolia*, Del., and *C. angustifolia*, Vahl. *C. acutifolia* is a native of many districts of Nubia, e.g., Dongola, Berber, Kordofan, and Senaar, but is grown also in Timbuctoo and Sokoto. The leaflets are collected twice a year by the natives, the principal crop being gathered in September after the rainy season and a smaller quantity in April. The leaves are dried in the simplest manner by cutting down the shrubs and exposing them on the rocks to the burning sun until quite dry. The leaflets then readily fall off and are packed in large bags made of palm leaves, and holding about a quintal each. These packages are conveyed by camels to Assouan and Darao and thence to Cairo and Alexandria, or by ship by way of Massowah and Suakim. The leaflets form the Alexandrian senna of commerce. Formerly this variety of senna was much adulterated with the leaves of *Solenostemma Argel*, Hayne, which, however, are readily distinguishable by their minutely wrinkled surface. Of late years Alexandrian senna has been shipped of much better quality. Occasionally a few leaves of *C. obovata*, Coll., may be found mixed with it. *C. angustifolia* affords the Bombay, East Indian, Arabian, or Mecca senna of commerce. This plant grows wild in the neighbourhood of Yemen and Hadramaut in the south of Arabia, in Somali Land, and in Sind and the Punjab in India. The leaves are chiefly shipped from Mocha, Aden, Jeddah, and other Red Sea ports to Bombay and thence to Europe, the average imports into Bombay amounting to about 250 tons annually, of which one-half is re-exported. Bombay senna is very inferior in appearance to the Alexandrian, as it frequently contains many brown and decayed leaflets and is mixed with leaf-stalks, &c. *C. angustifolia* is also cultivated in the extreme south of India, and there affords larger leaves, which are known in commerce as Tinnevely senna. This variety is carefully collected, and consists almost exclusively of leaves of a fine green colour, without any admixture of stalks. It is exported from Tuticorin.

Senna appears to have been introduced into Europe about the 9th century by Arabian physicians, by whom, however, the pods seem to have been preferred to the leaves. The medicinal activity of senna leaves appears to be due to a very unstable colloid glucoside to which the name of cathartic acid has been given. It is readily decomposed by a temperature much below 100° Fahr. (*Pharm. Jour. Trans.*, [3], xv. p. 704), and hence cold preparations of senna are the most active. In the free state it is soluble in dilute alcohol and in water, forming a brown solution, but is almost insoluble in strong alcohol and entirely so in ether and chloroform. Combined with ammonia it forms an active purgative. Two bitter principles named sennacrol and senna-picrin have been extracted from senna by Ludwig; the former is soluble and the latter insoluble in ether. A yellow colouring matter has also been obtained from senna, but it appears probable that it is only a decomposition product of cathartic acid. Senna must be included among the irritant purgatives, since cathartic acid has no aperient effect when injected into the

blood. Owing to its colloid character, it is absorbed with difficulty, and its action is thus exerted throughout the greater part of the intestinal canal.

SENNACHERIB. See **BABYLONIA**, vol. iii. p. 187, and **ISRAEL**, vol. xiii. p. 413 sq.

SENNAR. See **SENAAR**.

SENS, a town of France, chef-lieu of an arrondissement in the department of Yonne, lies on the right side of the Yonne near its confluence with the Vanne, and on the railway from Paris to Lyons, 70 miles south-east of the former city at the intersection of the line from Orleans to Troyes. It derives its importance from its antiquity and its archiepiscopal see. The cathedral of St Étienne occupies the site of an ancient temple on which St Savinian is said to have built, at the close of the 3d century, a little church consecrated to the Virgin. The present Gothic cathedral, erected between 1122 and 1168, subsequently underwent alteration in the 13th century and again under Louis XII. The west front measures 154 feet in breadth; the middle portal has good sculptures, representing the parable of the virgins and the story of St Stephen. The right-hand portal contains twenty-two remarkable statuettes of the prophets, which have suffered considerable injuries. Above this portal rises the stone tower, decorated with armorial bearings and with statues representing the principal benefactors of the church. The bells in the campanile, by which the tower is surmounted, enjoyed immense reputation in the Middle Ages; the two which still remain, La Savinienne and La Potentielle, weigh respectively 15 tons 7 cwts and 13 tons 13 cwts. The left portal is adorned with two bas-reliefs, *Liberality and Avarice*, as well as with the story of John the Baptist. The portal on the north side of the cathedral is one of the finest examples of French 16th-century sculpture. Glass windows of the 12th to the 16th century are preserved, some of them representing the legend of St Thomas of Canterbury. Among the interior adornments are an altarpiece finely carved in stone, the tomb of the dauphin (son of Louis XV.) and his consort, Marie Joséphe of Saxony, one of the masterpieces of Coustou, and bas-reliefs from the mausoleum of Cardinal Duprat. The treasury contains a fragment of the true cross presented by Charlemagne, and the vestments of St Thomas of Canterbury. It was in the cathedral of Sens that St Louis, in 1234, married Marguerite of Provence, and five years later deposited the crown of thorns. The official buildings of the cathedral, dating from the 13th century, have been restored by Viollet-le-Duc. The old judgment-hall and the dungeons had remained intact; in the first story is the synod hall, vaulted with stone and lighted by beautiful grisaille windows. A Renaissance structure connects the buildings with the archiepiscopal palace, which also dates from that period. The oldest of the other churches of Sens is St Savinian, the foundation of which dates from the 3d century, while the crypt is of the early part of the 11th, and the upper portions of the bell-tower of the first years of the 13th. The contents of the museum of sculptured stones have been mainly derived from the old fortifications, which were themselves constructed during barbarian invasion from the ruins of public monuments. The only town gate still preserved is that known as the dauphin's (1777). In the public library are a number of MSS. and a famous missal with ivory covers. The chemist Thenard has his statue in the town. The population in 1881 numbered 13,440.

Sens, when the capital of the Senones, one of the most powerful peoples of Gaul, bore the name of *Agenticum*. It was not finally subdued by the Romans till after the defeat of Vercingetorix. On the division of Gaul into seventeen provinces under the emperor Valens, *Agenticum* became the metropolis of the 4th *Lugdunensis*. Theatres, circuses, amphitheatres, triumphal arches, and aqueducts were all built in the town by the Romans. It was the meeting point of six great highways. The inhabitants, converted to Chris-

tianity by the martyrs Savinian and Potentian, held out against the Alemanni and the Franks in 356, against the Saracens in 731 or 738, and finally against the Normans in 886,—the last having besieged the town for six months. At the commencement of the feudal period Sens was governed by counts, who had become hereditary towards the middle of the 10th century; and the contests of these counts with the archbishops or with their feudal superiors often led to much bloodshed and disaster. Several councils were held at Sens, notably that at which St Bernard and Abélard met. The burgesses in the middle of the 12th century formed a defensive association which carried on war against the clergy, and Philip Augustus restored the commune. In the ardour of its Catholicism Sens massacred the Protestants in 1562, and it was one of the first towns to join the League. Henry IV. did not effect his entrance till 1594, and he then deprived the town of its privileges. In 1622 Paris, hitherto suffragan to Sens, was made an archbishopric, and the bishoprics of Chartres, Orleans, and Meaux were transferred to the new jurisdiction. In 1791 the archbishopric was reduced to a bishopric of the department of Yonne. Suppressed in 1801, the see was restored in 1807 with the rank of archbishopric. The town was occupied by the invaders in 1814 and 1870-71.

SENSITIVE PLANT. See **MIMOSA**; comp. **PHYSIOLOGY**, vol. xix. p. 62.

SEONI, or **SEONEE**, a British district of India, in the Central Provinces, lying between 21° 36' and 22° 58' N. lat. and 79° 14' and 80° 19' E. long., with an area of 3247 square miles, is bounded on the N. by Jabalpur, on the E. by Mandla and Bálághát, on the S. by Nágpur and Bhandára, and on the W. by Narsinhpur and Chhindwára. Seoni is a portion of the upland tract formed by the Sápura Hills which extend along the south bank of the Narbadá (Nerbudda) from the plains of Broach on the west to the Maikal range in the east; and it is remarkable for the beauty of its scenery and the fertility of its valleys. The northern and western portions of the district include the plateaus of Lakhnádón and Seoni; the eastern section consists of the watershed and elevated basin of the Wainganga; and in the south-west is a narrow strip of rocky land known as Dongartál. The plateaus of Seoni and Lakhnádón vary in height from 1800 to 2000 feet; they are well cultivated, clear of jungle, and their temperature is always moderate and healthy. Geologically the north part of Seoni consists of trap hills and the south of crystalline rock. The soil of the plateaus is the rich black cotton soil formed by disintegrated trap, of which about two-thirds of the district are said to consist, but towards the south, where cliffs of gneiss and other primitive formations occur, the soil is silicious and contains a large proportion of clay. Seoni is hilly throughout, the hills for the most part being clothed with small stunted trees; but in the valleys and on the plateaus forest trees are very thinly scattered and are seldom of large size. The chief river of the district is the Wainganga, with its affluents the Hirí, Ságár, Thelí, Bijná, and Thánwar; other streams are the Tímar and the Sher, affluents of the Narbadá. The average annual rainfall is about 50 inches.

The census of 1881 returned the population of Seoni district at 334,733 (males 167,925, females 166,808); of these 179,705 were Hindus, 13,442 Mohammedans, 99 Christians, and 139,444 aboriginals. **SEONI** (*q.v.*) is the only town with a population exceeding 10,000. Of the total district area of 3247 square miles only 1098 are cultivated, and of the portion lying waste 613 are returned as cultivable. Wheat forms the staple crop; rice and other food-grains are also extensively grown; and among miscellaneous products are cotton, fibres, and sugar-cane. In 1883-84 the gross revenue of Seoni amounted to £35,419, of which the land-tax yielded £15,379. Trade is chiefly carried on by means of markets in the towns. Manufactures consist of coarse cloth and some pottery of superior quality made at Kánhiwára. At Khawása, in the midst of the forest, leather is beautifully tanned. The only means of communication is by road, the aggregate length of which is estimated at 90 miles. Seoni came under British rule early in the 19th century, on the downfall of the Nágpúr power, and it was formed into a separate district in 1861.

SEONI, principal town and administrative headquarters of the above district, is situated in 22° 5' 30" N. lat. and 79° 35' E. long., midway between Nágpur and Jabalpur.

It was founded in 1774 by Mohammed Amín Khán, and contains large public gardens, a fine market-place, and a handsome tank. In 1881 the population was 10,203.

SEPIA is a valuable and much used deep brown pigment obtained from the ink-sacs of various species of CUTTLE-FISH (*q.v.*); that from which it is principally obtained is *Sepia officinalis*, a native of the Mediterranean, and especially abundant in the upper parts of the Adriatic, where it is a prized article of food. To obtain sepia the ink-sac is, immediately on the capture of the animal, extracted from the body and speedily dried to prevent putrefaction. The contents are subsequently powdered, dissolved in caustic alkali, and precipitated from the solution by neutralizing with acid. The precipitate after washing with water is ready to make up into any form required for use.

Sepia-bone or *cuttle-bone* consists of the internal "shell" or skeleton of *Sepia officinalis* and other allied species. It is an oblong convex structure from 4 to 10 inches in length and 1 to 3 inches in greatest width, consisting internally of a highly porous cellular mass of carbonate of lime with some animal matters covered by a hard thin glassy layer. It is used principally as a polishing material and for tooth powder, and also as a moulding material for fine castings in precious metals.

SEPOY, the usual English spelling of *sipáhí*, the Persian and Urdú term for a soldier of any kind. The word *sipáhí*, "army," from which *sipáhí*, "soldier," is derived, corresponds to the Zend *spáda*, Old Persian *spáda*, and has also found a home in the Turkish, Kurdish, and Pashto (Pushtu) languages (see Justi, *Handbuch der Zendsprache*, p. 303, 6), while its derivative is used in all Indian vernaculars, including Tamil and Burmese, to denote a native soldier, in contradistinction to *gorá*, "a fair-complexioned (European) soldier." Towards the middle of the 18th century efforts were made by the East India Company to train natives of good caste, both Hindus and Mohammedans, for military service under the company. Though they were made to use the musket, they remained for some time chiefly armed in the fashion of the country, with sword and target; they wore the Indian dress—the turban, vest, and long drawers—and were provided with native officers under English superior command. Under their European leaders they were found to do good service and to face danger with constancy and firmness. In the progress of time a considerable change took place, and natives of every description were enrolled in the service. Though some corps that were almost entirely formed of the lowest classes achieved considerable reputation for valour in the field, it was not considered safe to encourage the system; and the company reverted to their practice of recruiting from none but the most respectable classes of native society. It is on record that a corps of 100 sepoys from Bombay and 400 from Tellicherry joined the army at Madras in 1747, that the regular sepoys at Madras were employed in the defence of Arcot (1751), and that a company of Bombay sepoys were present at the victory of Plassey.

For instances of the early occurrence of the word see Burnell and Yule's *Glossary of Anglo-Indian Terms*, s.v. On the history of the sepoys compare Captain Williams's *Historical Account of the Rise and Progress of the Bengal Infantry* (London, 1817); Captain Broome's *History of the Rise and Progress of the Bengal Army* (Calcutta, 1850); Colonel Wilson's *History of the Madras Army* (London, 1882-85, in 3 volumes); No. xxxvi. of the *Quarterly Review*; and the military histories of India generally.

SEPTEMBER, the seventh month of the old Roman year, had thirty days assigned to it. By the Julian arrangement, while retaining its former name and number of days, it became the ninth month. The Ludi Magni (Ludi Romani) in honour of Jupiter, Juno, and Minerva began on the 4th of September. The principal ecclesiastical feasts falling within the month are—the Nativity of the Blessed Virgin on the 8th, the Exaltation of the Holy Cross on the 14th, St Matthew the Apostle on the 21st, and St Michael the Archangel on the 29th. September

was called "harvest month" in Charlemagne's calendar, and it corresponds partly to the Fructidor and partly to the Vendémiaire of the first French republic.

SEPTICÆMIA. After a wound, whether the result of accident or of operation by the surgeon, blood-poisoning may occur. Sepsis or putrefaction in the wound is the most evident local condition which has been associated by clinical observers with blood-poisoning, and hence the term "septicæmia." Within recent years the relation of micro-organisms to the different forms of blood-poisoning has come prominently into notice; putrefaction is now known to be only one of the fermentative changes due to the presence of certain micro-organisms in a wound, and it is admitted that there are many organisms which, when they enter a wound, may give rise there to fermentative changes that are non-putrefactive. (See SCHIZOMYCETES.)

Organisms have recently been divided into two great groups,—those which can only grow in dead or decaying matter and those which can grow in the living tissues and in the blood, which in this relation must be looked upon as a tissue. The first group has been termed "saprophytic." The second group may be termed "pathogenic," to distinguish them from the saprophytic variety. But no distinct line of demarcation can yet be drawn between these two groups, and as a matter of fact some pathogenic organisms may equally with the saprophytic find a pabulum in dead and decaying matter. Yet there can be no doubt that the more common varieties of septic organisms or saprophytes can only grow in dead or decaying matter, and that the living tissues, more especially when their power of vitality is great, are able to resist and destroy the saprophytes. There are also some organisms which, as far as is known at present, may be innocuous and give rise to no symptoms, local or general, when they are implanted in the human body. When an organism finds in the tissues a fit pabulum for its growth and development, the elements in the tissue are broken up, and the products are termed a "ptomaine" (πτώμα). This ptomaine may irritate the wound and prevent healing; it may also be absorbed into the blood and poison it, hence the term "ptomaine poisoning." Both the saprophytic and the pathogenic organism may form a ptomaine in the wound. When the wound is due to a saprophyte the absorption of the ptomaine has been termed "sapræmia"; the ptomaine of the saprophyte has been called "sepsin." No special name has yet been given to the ptomaine formed in the wound by the pathogenic organism; nor has any name been given to the condition due to the absorption of the ptomaine formed by the pathogenic organism. Our knowledge is not yet sufficient to enable us to separate these two varieties of ptomaine poisoning. There can, however, be little doubt that they do exist as separate conditions, and also there can be little doubt that in some instances both forms of poisoning may be present at one and the same time.

The pathogenic organism, however, has another power which gives rise to an entirely separate condition. Not only may it form its ptomaine in the wound, but the organism itself can enter into and be carried by the blood-stream and lymph-stream to distant parts. It can live in the blood or lymph-stream and can grow there: it may be arrested in the capillaries of the blood-vessels, or in the lymphatic glands of the lymph-vessels, and in these situations may form, so to speak, a colony of organisms which develop and form ptomaines; and the ptomaines, passing into the blood, may still further poison the patient. This power of the pathogenic organism is infective, and the term "infection" has been applied to the process. These colonies or secondary foci of infection often go on to supuration; hence the term "secondary" applied to the

abscesses which have long been observed in some forms of blood-poisoning. It was at one time thought that the pus-cells in the original wound passed into the blood, and, being caught in the capillaries, were the cause of the abscess-formation in the parts distant from the wound; hence the term "pyæmia" or pus in the blood. The pus-cells may enter the blood-stream; it is not, however, the cellular element that is the essence of the condition, but the organism which the cellular element may carry along with it. The hectic condition observed in a case of long-continued suppuration is in all probability a chronic form of blood-poisoning. In very acute cases, in which the poison is either concentrated, virulent, or in large quantity, death may occur within a very few hours. In other cases the condition may become chronic, and if the strength of the patient can be kept up by stimulants recovery often takes place. The chances of recovery are much greater when the condition is not truly an infective one. When the manufactory of the ptomaine is only in the wound, the organism may be there destroyed by the use of powerful antiseptics or antifermentatives. The primary cause being removed, the patient may then be saved. When, however, the pathogenic organism gets into the blood-stream and distant foci of infection are formed, the chances of ultimate recovery are greatly diminished. Various unsuccessful attempts have been made by the internal administration of antifermentatives so to alter the blood that the micro-organism cannot find in it or the tissues a fit nidus. The point to attend to is to prevent organismal fermentation in wounds by careful antiseptic or rather antifermentative precautions. Just as the word "septicæmia" has a more general application than can now be strictly allowed if we look to the derivation of the word and the present state of our knowledge, so the word "antiseptic" is applied to all substances which prevent organismal fermentation, although many of these organisms are undoubtedly non-septic in their character.

SEPTUAGINT. The Septuagint (οἱ ὀ, LXX.) or Alexandrian version of the Old Testament seems to be named from the legend of its composition by seventy, or more exactly seventy-two, translators. In the *Letter of Aristæus* (Aristæus)¹ this legend is recounted as follows. Demetrius Phalereus, keeper of the Alexandrian library, proposed to King Ptolemy II. Philadelphus to have a Greek translation of the Jewish law made for the library. The king consented and sent an embassy, of which the author of the letter was a member, to the high priest Eleazar at Jerusalem asking him to send six ancient, worthy, and learned men from each of the twelve tribes to translate the law for him at Alexandria. Eleazar readily consented and sent the seventy-two men with a precious roll of the law. They were most honourably received at the court of Alexandria and conducted to the island (Pharus), that they might work undisturbed and isolated. When they had come to an agreement upon a section Demetrius wrote down their version; the whole translation was finished in seventy-two days. The Jewish community of Alexandria was allowed to have a copy, and accepted the version officially,—indeed a curse was laid upon the introduction of any changes in it.

There is no question that this *Letter* is spurious.² Aristæus is represented as a heathen, but the real writer must have been a Jew and no heathen. Aristæus is represented as himself a member of the embassy to Eleazar; but the author of the *Letter* cannot have been a contemporary of the events he records, else he would have known

that Demetrius fell out of favour at the very beginning of the reign of Philadelphus, being said to have intrigued against his succession to the throne.³ Nor could a genuine honest witness have fallen into the absurd mistake of making delegates from Jerusalem the authors of the Alexandrian version. The forgery, however, is a very early one. "There is not a court-title, an institution, a law, a magistracy, an office, a technical term, a formula, a peculiar phrase in this letter which is not found on papyri or inscriptions and confirmed by them."⁴ That in itself would not necessarily imply a very early date for the piece; but what is decisive is that the author limits canonicity to the law and knows of no other holy book already translated into Greek. Further, what he tells about Judæa and Jerusalem is throughout applicable to the period when the Ptolemies bore sway there and gives not the slightest suggestion of the immense changes that followed the conquest of Palestine by the Seleucids. Thus, too, it is probable that the Jewish philosopher Aristobulus, who lived under Ptolemy Philometor (180-145), derived his account of the origin of the LXX. from this *Letter*, with which it corresponds.⁵

If now the *Letter* is so old, it is incredible that it should contain no elements derived from actual tradition as to the origin of the LXX., and we must try to separate these from the merely fabulous. To this end we must consider what is the main aim and object of the forgery. The chief thing in the *Letter* is the description of a seven days' symposium of the seventy translators at the Alexandrian court, during which each of them has a question to answer, and raises the admiration of the king for the wisdom produced among the Jews by their knowledge of the law. Further, very great weight is laid on the point that the LXX. is the official and authoritative Bible of the Hellenistic Jews, having been not only formally accepted by the synagogue at Alexandria but authorized by the high priest at Jerusalem and the seventy elders who are in fact its authors. Other matters receive no special emphasis, and the presumption is that what is said about them is not deliberate fiction and in part at least is true. Thus it has always been taken as a fact that the version originated at Alexandria, that the law was translated first, and that this took place in the time of Ptolemy II. On the other hand, it has been thought difficult to believe that the scholarly tastes of the Alexandrians, personified in Demetrius Phalereus as the presiding genius of the Alexandrian library, could have furnished the stimulus to reduce the translation to writing. One can hardly call this intrinsically improbable in view of the miscellaneous literary tastes of the court of the Ptolemies. But it has been thought much more likely that the Septuagint was written down to satisfy the religious needs of the Jews by a translated Torah, since in fact the version is fitted for Jews and could have been intelligible only to them, and indeed never came to be circulated and known outside of their circles. Here, however, we must distinguish between written and oral interpretation. If interpretation was needed in the synagogue service, it was an oral interpretation that was given. It was not a natural thing for the Jews to *write* the translation,—indeed they had religious scruples against such a course. Only "Scripture" was to be written, and to put the contents of Scripture in writing in any other than the old holy form was deemed almost a profanation,—a feeling of which there is evidence in the *Letter* itself.⁶ It is well

known how in Palestine the Targum was handed down orally for centuries before it was at last reduced to writing; and, if, on the contrary, at Alexandria a written version came into existence so early, it is far from improbable that this was due to some influence from without. That the work is purely Jewish in character is only what was inevitable in any case. The translators were necessarily Jews and were necessarily and entirely guided by the living tradition which had its focus in the synagogal lessons. And hence it is easily understood that the version was ignored by the Greeks, who must have found it barbarous and unintelligible, but obtained speedy acceptance with the Jews, first in private use and at length also in the synagogue service.

The next direct evidence which we have as to the origin of the LXX. is the prologue to Ecclesiasticus, from which it appears that about 130 B.C. not only the law but "the prophets and the other books" were extant in Greek. With this it agrees that the most ancient relics of Jewish-Greek literature, preserved in the extracts made by Alexander Polyhistor (Eus., *Præp. Ev.*, ix.), all show acquaintance with the LXX. These later translations too were not made to meet the needs of the synagogue, but express a literary movement among the Hellenistic Jews, stimulated by the favourable reception given to the Greek Pentateuch, which enabled the translators to count on finding an interested public. If a translation was well received by reading circles amongst the Jews, it gradually acquired public acknowledgment and was finally used also in the synagogue, so far as lessons from other books than the Pentateuch were used at all. But originally the translations were mere private enterprises, as appears from the prologue to Ecclesiasticus and the colophon to Esther. It appears also that it was long before the whole Septuagint was finished and treated as a complete work.

As the work of translation went on so gradually and new books were always added to the collection the compass of the Greek Bible came to be somewhat indefinite. The law always maintained its pre-eminence as the basis of the canon; but the prophetic collection changed its aspect by having various Hagiographa incorporated with it according to an arbitrary arrangement by subjects. The distinction made in Palestine between Hagiographa and Apocrypha was never properly established among the Hellenists. In some books the translators took the liberty to make considerable additions to the original, and these additions—e.g., those to Daniel—became a part of the Septuagint. Nevertheless learned Hellenists were quite well aware of the limits of the canon and respected them. Philo can be shown to have known the Apocrypha, but he never cites them, much less allegorizes them or uses them in proof of his tenets. And in some measure the widening of the Old Testament canon in the Septuagint must be laid to the account of Christians. As regards the character of the version, it is a first attempt, and so is memorable and worthy of respect, but at the same time displays all the weaknesses of a first attempt. Though the influence of contemporary ideas is sometimes perceptible, the Septuagint is no paraphrase, but in general closely follows the Hebrew,—so closely indeed that we can hardly understand it without a process of retroversion, and that a true Greek could not have found any satisfaction in it. The same Greek word is forced to assume the whole range of senses which belongs in Semitic speech to the derivatives of a single root; a Hebrew expression which has various Greek equivalents according to the context is constantly rendered in one way; the aorist, like the Hebrew perfect, is employed as an inchoative with a much wider range of application than is tolerated in classical Greek. At the same time, many passages are freely rendered and turned where there is no

particular need to do so, and that even in books like the *Prophetæ Priores*, in which the rendering is generally quite stiff. The literalness of the version is therefore due not to scrupulousness but to want of skill, and probably in part also to accommodation to a kind of Jewish Greek jargon which had already developed in the mouths of the people and was really Hebrew or Aramaic in disguise. This Jewish dialect in turn found its standard in the Septuagint.

As the version is the work of many hands, it is naturally not of uniform character throughout all its parts,—indeed considerable varieties of character sometimes appear in one and the same book. The older constituents of the canon have an unmistakable family likeness as contrasted with the later books; this one may see by comparing Kings with Chronicles or Isaiah and Jeremiah with Daniel. The Pentateuch is considered to be particularly well done and Isaiah to be particularly unhappy. Some of the Hagiographa (Ecclesiastes, Canticles, Chronicles) are reproduced with verbal closeness; others, on the contrary (Job, Esdras, Esther, Daniel), are marked by a very free treatment of the text, or even by considerable additions. It is not, however, always easy to tell whether a Septuagint addition is entirely due to the translator or belongs to the original text, which lay before him in a recension divergent from the Massoretic. The chief impulse in recent times to thorough investigation of the character of the several parts of the Septuagint was given by Lagarde in his *Anmerkungen zur griechischen Uebersetzung der Proverbien*, Leipsic, 1863.

The Septuagint came into general use with the Grecian Jews even in the synagogue. Philo and Josephus use it, and so do the New Testament writers. But very early small corrections seem to have been introduced, especially by such Palestinians as had occasion to use the LXX., in consequence partly of divergent interpretation, partly of differences of text or of pronunciation (particularly of proper names). The Old Testament passages cited by authors of the first century of the Christian era, especially those in the Apocalypse, show many such variations from the Septuagint, and, curiously enough, these often correspond with the later versions (particularly with Theodotion), so that the latter seem to rest on a fixed tradition. Corrections in the pronunciation of proper names so as to come closer to the Massoretic pronunciation are especially frequent in Josephus. Finally a reaction against the use of the Septuagint set in among the Jews after the destruction of the temple,—a movement which was connected with the strict definition of the canon and the fixing of an authoritative text by the rabbins of Palestine. But long usage had made it impossible for the Jews to do without a Greek Bible, and to meet this want a new version was prepared corresponding accurately with the canon and text of the Pharisees. This was the version of Aquila, which took the place of the Septuagint in the synagogues, and long continued in use there.¹ A little later other translations were made by Jews or Jewish Christians, which also followed the official Jewish canon and text, but were not such slavish reproductions as Aquila's version; two of these were Greek (Theodotion, Symmachus) and one Syriac (Peshito).

Meantime the Greek and Latin Christians kept to the old version, which now became the official Bible of the catholic church. Yet here also, in process of time, a certain distrust of the Septuagint began to be felt, as its divergence from the Jewish text was observed through comparison of the younger versions based on that text, or came into notice through the frequent discussions between Jews and Christians as to the Messianic prophecies.

¹ *Corpus Juris Civ.*, Nov. cxlvi.

On the whole the Christians were disposed to charge the Jews with falsifying their Scriptures out of hatred to Christianity,—a charge which has left its echoes even in the Koran. But some less prejudiced scholars did not share this current view, and went so far in the other direction as simply to identify the Jewish text with the authentic original. Thus they fell into the mistake of holding that the later Jewish text was that from which the Septuagint translators worked, and by which their work was to be tested and measured. On these critical principles Origen prepared his famous *Hexapla*, in which he placed alongside of the Septuagint, in six parallel columns, the three younger versions and the Hebrew text in Hebrew and in Greek characters. The Septuagint text he corrected after the younger versions, marking the additions of the LXX. with a prefixed obelus (—, ÷), as a sign that they should be deleted, and supplying omissions, generally from Theodotion, with a prefixed asterisk (*). The end of the passage to which the obelus or asterisk applied was marked with a metobelus (<). The same signs were used for various readings, the reading of the LXX. being obelized, and the variant, from another version corresponding to the Hebrew text, following it with an asterisk. It was only in simpler cases, however, that this plan could be carried through without making the text quite unreadable; the more complicated variations were either tacitly corrected or left untouched, the reader being left to judge of them by comparing the parallel columns. Origen made most change in the proper names, which he emended in conformity with the Jewish pronunciation of the period, and in the order of the text, which, to preserve the parallelism in the columns, he made to follow the Hebrew.¹

Origen's critical labours had a very great influence in shaping the text of the Septuagint, though in quite another direction than he designed. Even before his time the Septuagint was largely contaminated by admixture from the other versions, but such alterations now began to be made systematically. Thus he intensified a mischief which to be sure had begun before him, and even before the labours of Aquila, Theodotion, and Symmachus. The most significant evidence of this contamination of the text lies in the conflate readings, where the same Hebrew words are translated twice, or sometimes even thrice, or where two Hebrew readings of the same passage are represented, sometimes by simple juxtaposition of renderings that differ but slightly, at other times by a complicating interlacing of very different forms of the Greek. These conflated readings, however, in which the true reading survives along with the false, are the least fatal corruptions; in many cases the genuine text has disappeared altogether before the correction, as can be seen by comparing different MSS. A faithful picture of the corruption of the text of the Septuagint as it has come down to us is given in the apparatus to the great Oxford edition of Holmes and Parsons (5 vols., Oxford, 1798-1827).

Not long after Origen there arose almost contemporaneously three recensions of the Septuagint, which became established in three regions of the Greek Church. "Alexandria et Ægyptus in Septuaginta suis Hesychium laudat auctorem, Constantinopolis usque Antiochiam Luciani martyris exemplaria probat, mediæ inter has provincie Palestinæ codices legunt, quos ab Origene elaboratos Eusebius et Pamphilus vulgaverunt; totusque orbis hac inter se trifaria varietate compugnat," says Jerome in the *Præf. in Paralip. ad Chromatium*. According to this the text of Eusebius is that of Origen, i.e., a separate edition of the fifth column of the *Hexapla*, which contained the

Septuagint with asterisks and obeli. The text of Hesychius has not yet been identified with certainty²; that of Lucian is, according to Field and Lagarde, most probably given in *Codd. Holmes*, 19, 82, 93, 108, and another series of MSS. for the prophets. It is by no means the case, however, that all our MSS. can be arranged in three families; many belong to none of the three recensions, and among these are such important codices as the Alexandrian (A) and the Vatican (B).

The divergences of the LXX. from the Hebrew are particularly great in the books of Samuel and Kings, also in the prophets, especially in Ezekiel, and still more in Jeremiah, and finally also in Job and Proverbs. In Jeremiah the differences extend to the order of the chapters in the second half of the book, and therefore have always attracted special attention. In Proverbs too the individual proverbs are differently arranged in the LXX., and similar differences can be traced in the versions of Ecclesiasticus. In the Pentateuch there are considerable variations only in the last part of Exodus. The text of the genuine Septuagint is generally shorter than the Massoretic text.

The chief editions of the Septuagint are—(1) the Complutensis, 1514-17; (2) the Aldine, 1516; (3) the Sixtine, 1587; (4) the first Oxford edition by Grabe, 1707-20; (5) the second Oxford edition by Holmes and Parsons, 1798-1827; (6) Lagarde's edition of Lucian, vol. i., Göttingen, 1883.

The LXX. is of great importance in more than one respect: it is probably the oldest translation of considerable extent that ever was written, and at any rate it is the starting-point for the history of Jewish interpretation and the Jewish view of Scripture. And from this its importance as a document of exegetical tradition, especially in lexical matters, may be easily understood. It was in great part composed before the close of the canon—nay, before some of the Hagiographa were written—and in it alone are preserved a number of important ancient Jewish books that were not admitted into the canon. As the book which created or at least codified the dialect of Biblical Greek, it is also the key to the New Testament and all the literature connected with it. But its chief value lies in the fact that it is the only independent witness for the text of the Old Testament which we have to compare with the Massoretic text. Now it may seem that the critical value of the LXX. is greatly impaired, if not entirely cancelled, by the corrupt state of the text. If we have not the version itself in authentic form we cannot reconstruct with certainty the Hebrew text from which it was made, and so cannot get at various readings which can be confidently confronted with the Massoretic text; and it may be a long time before we possess a satisfactory edition of the genuine Septuagint. But fortunately in this case sound results in detail must precede and not follow the establishment of a text sound throughout. The value of a Septuagint reading must be separately determined in each particular case, and the proof that a reading is good is simply that it necessarily carries us back to a Hebrew variant, and cannot be explained by looseness of translation. It is therefore our business to collect as many Greek passages as possible which point to a various

² See, however, Ceriani's note on the recensions of LXX. in the *Rendiconti* of the R. Istituto Lombardo for 18th February 1886, where it is shown that the *Codex rescriptus Dublinensis*, Holmes, viii., edited at Dublin, 1880, and other MSS. written in Egypt, which Ceriani had already cited in his *Monumenta* (vol. iii. p. xx.) present many features of correspondence with the Coptic versions and with the readings of Cyril of Alexandria. "All these documents at any rate present the character of the Hesychian recension, being all Egyptian testimonies contemporary with or little later than Jerome." Most of their characteristic readings appear also in MS. Holmes, 106, to which MSS. 26, 33, 86, 97, 198, 206 are also akin. For an attempt to determine the MSS. containing or akin to the Hesychian recension in Ezekiel, see Cornill, *Das Buch Ezechiel*, Leipzig, 1886, p. 66 sq.

¹ The best collection of the fragments of the *Hexapla* is that of Field, *Origenis Hexaplorum quæ supersunt*, Oxford, 1875.

reading in the Hebrew text of the translators as compared with the Massoretic text. And for this we must not confine ourselves to one recension but use all recensions that our MSS. offer. For, though one recension may be better than another, none of them has been exempt from the influences under which the genuine Septuagint was brought into conformity with the received Hebrew text, and those influenced have affected each recension in a different way, and even differently in the different books. In this process, as indeed in all textual criticism, much of course must be dependent on individual judgment. But that it should be so appears to have been the design of providence, which has permitted the Old Testament text to reach us in a form that is often so corrupt as to sin against both the laws of logic and of grammar—of rhetorical and poetical form. (J. WE.)

SEPULCHRE, CANONS REGULAR OF THE HOLY, an order founded in 1114 by Arnold, patriarch of Jerusalem (or according to another account in 1099 by Godfrey of Bouillon), on the rule of St Augustine. It admitted women as well as men and soon spread rapidly over Europe. In the 17th century it received a new rule from Urban VIII. Shortly after this the canons became extinct; but the canonesses are still to be found in France, Baden, and the Netherlands. They live a strictly monastic life and devote themselves mainly to the work of education.

SEPULCHRE, KNIGHTS OF THE HOLY, an English military order which was said to date from the 12th century and which became extinct at the Reformation. A similar order, founded in France, lasted from the end of the 15th century till the time of the Revolution; it was resuscitated by Louis XVIII. in 1814, but again became extinct in 1830.

SEPULCHRE, THE HOLY, the rock-cut tomb in which, after His crucifixion, the body of our Lord was placed. Few questions of topography have been debated with greater persistence or, in many cases, with greater bitterness than that of the site of this tomb. Only a brief sketch of the leading features of the controversy can be given here.

The only information on the subject to be gained from the New Testament is that the tomb was in a garden "in the place where Christ was crucified" (John xix. 41), which again was "near the city" (John xix. 20) and "without the gate" (Heb. xiii. 12), and that the watch, proceeding from the sepulchre to the chief priest's, "came into the city" (Matt. xxviii. 11). The first requisite, therefore, of any locality professing to be that of the Sepulchre is that it should, at the date of the crucifixion, have been *without* the walls of Jerusalem.¹

The existing church of the Holy Sepulchre, which is admitted on all hands to have occupied the same site for the last 800 years, is in the heart of the present town, 300 yards from the nearest point of the existing wall and in the immediate vicinity of the bazaars. Saewulf,² writing in 1102, Hildebrand of Oldenburg³ in 1211, and Jacobus de Vitriaco⁴ in 1220, assert that up to the time of Hadrian the site was still without the circuit of the walls. Brocardus⁵ in 1230 states that the modern walls included more in breadth than they did at the time of

Christ, and that there were even some who refused to believe that the present site was the true one. Ordericus⁶ in 1320 and William de Baldensel⁷ in 1336 corroborated Saewulf; but Baldensel adds that the sepulchre then shown was no longer the one in which the body of Christ had been laid, for that had been cut out of the solid rock, while the other was formed out of stones cemented together. Gretser⁸ in 1598 and Quaresimus⁹ in 1616-25 refer to the objections started in their time by some whom the latter calls "misty Western heretics," and the difficulty was broadly enunciated by Monconys¹⁰ in 1647. It was not, however, until 1741 that the site was openly declared to be false by Korte.¹¹ The attack of the latter writer was followed up in greater detail by Plessing¹² in 1789, and in England by Dr Edward Clarke¹³ in 1810; but until the appearance of the *Biblical Researches* of Dr Robinson of New York in 1841¹⁴ the attention of inquirers in England and America can hardly be said to have been seriously drawn to the subject. This elaborate work called forth energetic replies from Cardinal Newman¹⁵ and Williams,¹⁶ the latter of whom subsequently republished his work in two large volumes in 1849, which, to the upholders of tradition, may be said to occupy the same position as those of the American author to its opponents. Since that date the writers on both sides have been numerous; among them may be specially noted, as impugning the accuracy of tradition, Fergusson, Tobler, the author of an elaborate essay in the *Museum of Classical Antiquities* for 1853, Barclay, Bonar, Schwartz, Sandie, and Conder; and on the other side Lord Nugent, Schutz, Krafft, Schaffter, De Sauley, Abbé Michon, Thrupp, De Vogué, Lewin, Pierotti, Caspari, and Sir Charles Warren.

The main question on which the dispute has turned is the circuit of the walls at the time of Christ. The city at that date was surrounded by two walls. The first or oldest began, according to Josephus, "in the north, at the tower called Hippius, and extended to what was termed the Xystus; it then formed a junction with the council house, and terminated at the western colonnade of the temple."¹⁷ By almost all the writers on either side this northern portion of the first wall is traced along the southern side of the depression, which extends from the central valley eastwards to the Jaffa gate.¹⁸ From some point in that northern line of wall the second wall took its departure, and of it all we are told by Josephus is that "it had its beginning at the gate called Gennath, belonging to the first wall, and reached to the Antonia, encircling only the western quarter of the city." If this Gennath gate was near Hippius, the line of the second wall, in order to exclude the present site, must be drawn along a route curiously unsuited, from the slope of the hill, for defensive purposes; and that it was near Hippius seems

¹⁸ Fergusson and Sandie place Hippius at the north-western angle of the modern wall, and thus include the existing church of the sepulchre within the first wall itself, but they have overlooked the assertion of the Jewish historian, that from the ravines which surrounded the latter it was almost impregnable. Bonar, while placing Hippius somewhere near the same spot, does not define the locality, and Schwartz seeks to identify it with "a high rocky hill north of the so-called Grotto of Jeremiah" and far beyond the northern limits of the modern city.

¹ The revised text of John xix. 20 reads ὅτι ἐγγὺς ἦν τῆς πόλεως ὁ τόπος ὅπου ἐσταυρώθη ὁ Ἰησοῦς; but the best accredited reading is ὅτι ἐγγὺς ἦν ὁ τόπος τῆς πόλεως. Mr Buckton, in *Notes and Queries* (2d series, ii. 97), argues that according to the latter reading Calvary must have been within the city. He would explain Heb. xiii. 12 as spoken "for the allegorical purpose of the writers" of the temple, but offers no explanation of Matt. xxviii. 11.

demonstrable from the declaration of Josephus that the city in his time was "fortified by three walls except where it was encompassed by impassable ravines¹; from the absence of any record of an attack on the first wall till the second had been taken; from a variety of incidental references in the siege by Titus; from the apparent necessity of including within its circuit the pool Amygdalon, now known as Hezekiah's Pool or Birket Hamman el-Batrak²; and from the remarkably small area which would otherwise be included by it.

Writers on both sides have pressed into their service the remains of ancient buildings found in the districts traversed by the second wall according to their respective theories. It seemed doubtful, till quite recently, if any sound argument could be based on these, the ruins being too fragmentary and occurring in too many different quarters to warrant any positive identification with a line of fortification as distinguished from other edifices.³ But in the summer of 1885 a stretch of ancient wall 40 or 50 yards in length was disinterred, running northwards from the open space within the Jaffa gate to the west of Hezekiah's pool, which certainly, as figured in the January number of the *Quarterly Reports* of the Palestine Exploration Fund, seems to go a long way to settle the question against the genuineness of the existing site.

Considerable stress has been laid by some writers on the existence of ancient Jewish sepulchres, of a date apparently anterior to the Christian era, in the rock on which the present church is built, as proving that that rock could not have been within the circuit of the walls, inasmuch as it is alleged "the Jews never buried within their towns."⁴ There is, however, no trace in the historical books of the Bible of any aversion on the part of the Jews to intramural interment. Whatever width of interpretation may be given to the recorded burial of eleven of the kings of Judah "in the city of David," the phrase can hardly be held to prove that such burial-place was *without* the walls; while 2 Chron. xxviii. 27 and xxxiii. 20 seem to point very strongly in the opposite direction. Joab also, we are told, was buried "in his own house in the wilderness,"⁵ and Samuel "in his house at Ramah."⁶ But the most striking case of all is Hebron, where in the midst of the city are found the jealously guarded walls which enclose the cave of Machpelah. If, then, these tombs are older than the time of Christ, there seems little difficulty in crediting that they might have been included within the second wall. We know for a certainty that they were within the third. The curious point rather is that their existence in the rock may be used as a strong argument against the site, for, speaking of the disinterment of the rock of the sepulchre from the accumulated soil heaped over it by the Romans, Eusebius⁷ impresses on us the fact

that there was "only one cave within it, lest, had there been many, the miracle of Him who overthrew death should have been obscured."

One argument remained which, at least up to 1847, it seemed difficult for the impugners of the orthodox site to meet, namely,—Was it at all probable that Constantine should have been deceived, either by erroneous inference or by wilful misrepresentation, when in 325 he erected a monumental church over what was then believed to be the holy tomb? Apart from the consideration that of all localities this seemed to be the least likely to pass from the memory of the Christian church,⁸ its exact position had been in a manner identified by the existence on the rock of Golgotha of a temple or statue of Venus, and on the site of the resurrection of a statue of Jupiter erected by Hadrian in the 2d century; and the fact remains that on the superincumbent rubbish being cleared away by the orders of Constantine a cave was discovered, which it seems difficult, even were we willing with Taylor⁹ to impute deliberate fraud to the existing bishop of Jerusalem, to believe could have been previously prepared beneath a heathen shrine, and in the midst of a population of pagans and of Jews.¹⁰

In 1847 Fergusson, in his *Essay on the Ancient Topography of Jerusalem*, attempted to show that Constantine had built his memorial church on another site altogether, and that it was still existing under another name. On the eastern hill of the city, in the sacred Mohammedan enclosure of the Harám-es-Sheríf, and on a spot generally considered to have formed part of the temple area, stands the magnificent octagonal building called the Dome of the Rock, usually but erroneously believed to have been erected by the caliph 'Omar, and so popularly known as the mosque of 'Omar. The jealousy of the Moslems had, with rare exceptions, prevented up to quite recent times the intrusion of Christians within its sacred precincts, but it was known to have been erected over a large mass of native rock rising above the surface of the ground and having a cave within it. A section of the building, very roughly executed, was given in the *Travels of Ali Bey*, published in 1816 (vol. ii. p. 74); but in 1833 Mr. Cotherwood, under the pretext of being a civil engineer in the employment of Mehemet Ali, and of examining into the structural condition of the building with a view to its repair, spent three weeks in examining it and its surroundings, of which he made elaborate drawings and sections. A general account of his investigations and their results, published in W. H. Bartlett's *Walks about the City and Environs of Jerusalem* (p. 148), led to Fergusson's getting access to those drawings, which confirmed him in the belief he had already begun to entertain from other sources, that the Dome of the Rock was originally a Christian edifice; and in the essay referred to he argued at great length and with much vigour on both architectural and historical grounds that it and the Golden Gateway—a walled-up entrance to the Harám from the east—were built in the time of Constantine; that the former was the church of the Anastasis, erected by that emperor over the tomb of our Lord, and the latter the entrance to the atrium of the great basilica described by Eusebius¹¹ as

¹ *Bell. Jud.*, v. 4, 1.

² It is of course quite possible to draw a line, as Lewin does, which, while it includes this pool, will yet exclude the existing church, but all probability seems opposed to such a route.

³ Pierotti gives a detailed plan of the whole district in which the remains which he seeks to identify with the second wall occur (*Jerusalem Explored*, pl. xxx.). But from this it would seem extremely doubtful whether any of those ruins can be identified with a city wall, or should not merely be regarded as portions of detached buildings, the walls of which project, now to the east, now to the west, of the imagined line.

⁴ Lord Nugent, *Lands Classical and Sacred*, London, 1845, ii. 47. These tombs have been described by Hepworth Dixon, in *Gentleman's Magazine*, March 1877, and more fully by Clermont-Ganneau in *Quarterly Report* of the Palestine Exploration Fund, 1877, p. 76. In 1885 two additional sepulchral chambers were discovered in the same rock a little to the south-east of the present church, of which a plan and notices are given by Schick in *Zeitschrift des deutschen Palaestina-Vereins*, 1884, vol. viii. p. 171.

⁹ *Ancient Christianity*, 4th ed., London, 1844, ii. 277.

¹⁰ Finlay (*Greece under the Romans*, p. 561) has argued that exact identification would be easy from the minute registration of property which prevailed in the Roman empire and extended to the provinces, by which the position of Golgotha and the property of Joseph of Arimathea might easily have been traced. But he seems to press his point too far (see Fallmerayer, *Golgotha und das heilige Grab*, 4to, Munich, 1852, p. 8).

¹¹ *Vita Const.*, iii. 39.

immediately adjoining; and that the transference of the site from the eastern to the western hill took place somewhere about the commencement of the 11th century, when, in consequence of the invasion of the Turks, the Christians were driven from the former hill for a time. This work was followed up by his article "Jerusalem" in Smith's *Dictionary of the Bible* and by several minor publications¹; and the whole question was, with some modifications, re-argued by him at great length in *The Temples of the Jews and the other Buildings in the Haram Area at Jerusalem* in 1878.

Though at first Fergusson's essay seemed to fall dead, it inaugurated a discussion which has within the last twenty years been carried on with much keenness. His views have been supported on architectural grounds by Unger,² and on general grounds by Sandie,³ Smith,⁴ and Langlois,⁵ while among the multitude of his opponents may be specially noted Williams,⁶ Lewin,⁷ the Abbé Michon,⁸ De Vogué,⁹ Pierotti,¹⁰ Sir Charles Warren,¹¹ and Captain Conder.¹²

The architectural arguments in favour of Fergusson's theory have forced Lewin, one of his most strenuous opponents, to argue that the Dome of the Rock may have been a temple to Jupiter erected by Hadrian, which he imagines may have been restored or rebuilt by Maximin Daza, the successor of Diocletian.¹³ But they must be studied in Fergusson's own works or in that of Unger above referred to. The topographical objections are mainly founded on the necessity of restricting the Jewish temple to the south-eastern corner of the Harám, the site, however, assigned to it by Lewin himself and Thrupp,¹⁴ and on the difficulty of supposing a place of interment so near the sacred building. But Josephus, at the time of the siege, speaks of "the monuments of King Alexander," whatever that may mean, existing just over against or in front of the north colonnade of the temple.¹⁵

As regards the historical argument, it would certainly appear that up to the close of the 6th century the balance of evidence is in favour of the eastern site. The narrative of the Pilgrim of Bordeaux¹⁶ may perhaps be read as supporting either view. But Antoninus Martyr¹⁷ and Theodosius¹⁸ can hardly be reconciled with the existing location; in two manuscripts of the latter¹⁹ the writer believed that the same hill witnessed in succession the offering of Isaac, the vision of the angel at Araunah's threshing-floor, the building of the temple, and the death and resurrection of

our Lord. Many more passages might be quoted from writers of this period testifying to the belief that the hill that witnessed the offering of Isaac witnessed also the resurrection of Christ, and many others identifying the scene of the offering of Isaac with the hill on which the temple was built. Perhaps the strongest point in this connexion against Fergusson is that so striking a fact as the identity of the hill of the Passion with that on part of which the temple stood should only be directly spoken to by a single writer. After the 9th century the historical evidence becomes more difficult to interpret. Fergusson would date the transference of the site about 1000; but it seems clear from Istakhri (978)²⁰ and Mokaddasi (987),²¹ both of whom were unknown to him, that before their days the Dome of the Rock was a Mohammedan place of worship, and the latter expressly states that it was suggested by a great Christian church.²² The natural date to assign for such a transference would be about 614, when the city was captured by the Persians, and, to quote the carefully guarded narrative of Gibbon, "the sepulchre of Christ and the stately churches of Helena and Constantine were consumed, or at least damaged, by the flames." The buildings were repaired or rebuilt by Modestus a few years later, and their praises are sung by Sophronius, his successor in the patriarchate, but in terms which give little topographical information. Sophronius lived to see the capture of the city by 'Omar in 636, the earliest records of whose doings as yet available are the brief one of Theophanes (818) and the more lengthened one of Eutychius (937). From both of these it seems clear that the caliph confirmed the Christians in the possession of the sites (whatever these might be) which he found in their hands. In or about 670 the French bishop Arculph visited Jerusalem, and under the hand of Adamnanus we have a detailed account taken down from his lips,²³ and a plan of the church of the Resurrection as he saw it, which strikingly corresponds to the Dome of the Rock,—as, however, it necessarily would correspond with any church which had been erected in close imitation of that building.²⁴ There are passages, however, in Arculph descriptive of the city very difficult to understand unless on the assumption that the transference of Sion, which had hitherto (see JERUSALEM) been identified with the eastern hill, had already in his time taken place. The next pilgrim who has left us a record is Willibald,²⁵ who visited the city early in the 8th century, and whose description applies on the whole better to the western than the eastern site;

¹⁵ *Bel. Jud.*, v. 5 § 3. Sandie's attempt (*Horeb and Jerusalem*, p. 259) to minimize this difficulty by supposing a rocky valley to have run up from the valley of Jehoshaphat westwards at this point, and so to have divided the temple from the tomb, seems inadmissible. Modern investigation shows that such a valley, or rather depression, did exist, but north, not south, of the Dome of the Rock.

²⁴ The view that at the time when Arculph wrote the Dome of the Rock was in the hands of the Mohammedans seems strengthened by the well-known Cufic inscription which still runs round the colonnade of that building, and a complete translation of which by the late Professor Palmer will be found in the *Quarterly Report of the Palestine Exploration Fund* (1871, p. 164) and Fergusson's *Temples of the Jews* (p. 269). In it the construction of the dome of the building is dated 72 A.H. (691), but the name of the builder, which clearly was Abd-el-Melek in the original, has been erased and that of Abdallah el-Mamun (198 A.H.; 813) fraudulently substituted, "the short-sighted forger," as Palmer calls him, having omitted to change the date as well as the name. In this inscription there is very special mention made of our Saviour, and in a way which seems inexplicable unless the building on which it was inscribed had been, in the mind of the writer, associated in some important respects with the history of Jesus. And the tradition that it was so continued long after; for we find Theoderic so late as 1176 writing of it, "Hoc templum, quod nunc videtur, ad honorem Domini nostri Jesu Christi ejusque pie genetricis ab Helena regina et ejus filio, imperatore Constantino, constructum est" (ed. Tobler, St Gall, 1865, p. 46). Fergusson believes this inscription to have been written in the 12th century, but is obliged to admit that the alphabet employed is identical with that found on the coins of Abd-el-Melek (*Temples of the Jews*, p. 24). A facsimile of the sentence containing the date and the forgery will be found in the Rev. Isaac Taylor's *The Alphabet* (London, 1883, i. p. 322).

²⁵ *Itin. Lat.* (Soc. de l'Or. Lat.), 1879, i. pp. 244-297.

but, on the other hand, that of Bernard,¹ who travelled about 870, applies better to the eastern than to the western. If the transference can be supposed to have taken place at the time of the Persian invasion, one of the main difficulties in the adoption of Fergusson's theory will be greatly lessened, for the intervening period of more than 450 years would go far to explain how the crusaders, on gaining possession of the city in 1099, failed to make it their first business to revert to the original site. On the whole, the question is one which can hardly be satisfactorily determined until the Arabic authorities on the subject have been duly scrutinized, and as yet we have practically access to none earlier than the two above referred to.²

Within the last few years a third locality has been suggested. In 1878 Captain Conder, in his *Tent Work in Palestine* (i. pp. 372-376), expressed a strong conviction that the real site was to be found on a rocky knoll outside the northern wall, and close to the cave known as "Jeremiah's Grotto." He argued that not only did this locality meet the requirements of the Gospel narratives, being outside the city and near one of the great roads leading from the country, but that in this direction lay "the great cemetery of Jewish times" as testified by "the sepulchre of Simon the Just preserved by Jewish tradition," and the monument of Helena "fitted with a rolling stone such as closed the mouth of the Holy Sepulchre." Here also by early Christian tradition had been the scene of the martyrdom of Stephen, which doubtless occurred at the place of public execution, and to this day, according to Dr Chaplin, the Jews designate the knoll "by the name Beth has-Sekilah, 'the place of stoning' (domus lapidationis), and state it to be the ancient place of public execution mentioned in the Mishnah." The hill itself appears to present a striking resemblance to a human skull, and so to associate itself with the word "Golgotha." The adoption of this site by Dr Chaplin, the Rev. S. Merrill, Schick, and perhaps especially the late General Gordon,³ has aided in giving it a considerable popularity. It is, however, a purely conjectural location, and involves the assumption that all the Christian writers from the 4th century downwards, as well as the mother of Constantine, were in error as to the real site. (A. B. M'G.)

SEQUESTRATION. See BANKRUPTCY.

SEQUOIA, a genus of conifers, allied to *Taxodium* and *Cryptomeria*, forming one of several surviving links between the firs and the cypresses. The two species usually placed in this group are evergreen trees of large size, indigenous to the west coast of North America. Both bear their round or ovoid male catkins at the ends of the slender terminal branchlets; the ovoid cones, either terminal or on short lateral twigs, have thick woody scales dilated at the extremity, with a broad disk depressed in the centre and usually furnished with a short spine; at the base of the scales are from three to seven ovules, which become reversed or partially so by compression, ripening into small angular seeds with a narrow wing-like expansion.

The redwood of the Californian woodsmen, *S. sempervirens*, which may be regarded as the typical form, abounds on the Coast Range from the southern borders of the State northwards into Oregon, and, according to De Candolle, as far as Nootka Sound. It grows to a gigantic size: a trunk

has been recorded 270 feet in length, and a greater height is said to be occasionally reached, while a diameter of from 12 to 15 feet is sometimes attained at the base. In old

Sequoia sempervirens—a, green cones and catkin; b, section of cone; c, scale of cone.

age the huge columnar trunk rises to a great height bare of boughs, while on the upper part the branches are short and irregular. The bark is red, like that of the Scotch fir, deeply furrowed, with the ridges often much curved and twisted. When young the tree is one of the most graceful of the conifers: the stem rises straight and tapering, with somewhat irregular whorls of drooping branches, the lower ones sweeping the ground,—giving an elegant conical outline. The twigs are densely clothed with flat spreading linear leaves of a fine glossy green above and glaucous beneath; in the old trees they become shorter and more rigid and partly lose their distichous habit. The globular brown catkins appear early in June; the cones, from 1 to 2 inches long, are at first of a bluish green colour, but when mature change to a reddish brown; the scales are very small at the base, dilating into a broad thick head, with a short curved spine below the deep transverse depression. The redwood forms woods of large extent on the seaward slope of the Coast Range and occurs in isolated groups farther inland. From the great size of the trunk and the even grain of the red cedar-like wood it is a valuable tree to the farmer and carpenter: it splits readily and evenly, and planes and polishes well; cut radially, the medullary plates give the wood a fine satiny lustre; it is strong and durable, but not so elastic as many of the western pines and firs. In England the tree grows well in warm situations, but suffers much in severe winters,—its graceful form rendering it ornamental in the park or garden, where it sometimes grows 30 or 40 feet in height; its success as a timber tree would be doubtful. In the eastern parts of the United States it does not flourish. Discovered by Menzies in the end of the 18th century, it has long been known in British nurseries under the name of *Taxodium sempervirens*.

The only other member of the genus is the giant tree of the Sierra Nevada, *S. gigantea*, the largest of known conifers; it is confined to the western portion of the great Californian range, occurring chiefly in detached groups

¹ *Itin. Lat.* (Soc. de l'Or. Lat.), 1879, i. pp. 309-320.

² Palmer, in the chapter contributed by him (mainly from Arabic sources) to *Jerusalem, the City of Herod and Saladin* (by W. Besant and E. H. Palmer, London, 1871), has failed to give, with rare exceptions, any clue to the date of the writers whose statements he embodied.

³ *Reflections in Palestine*, London, 1884, pp. 1-3. See also *Quarterly Report of Palestine Exploration Fund* for 1883, p. 69; and Sir J. W. Dawson's *Egypt and Syria, their Physical Features in Relation to Bible History*, London, 1885, pp. 85-95, where two illustrations of the hill are given.

locally called "groves," at an altitude of from 4000 to 5000 feet above the sea. The leaves of this species are awl-shaped, short and rigid, with pointed apex; closely adpressed, they completely cover the branchlets. The male catkins are small, solitary, and are borne at the ends of the twigs; the cones are from $1\frac{1}{2}$ to 3 inches long, ovoid, with scales thicker at the base than those of the redwood, and bearing below the depression a slender prickles. The young tree is more formal and rigid in growth than *S. sempervirens*, but when old the outline of the head becomes cylindrical, with short branches sparsely clad with foliage sprays. The bark, of nearly the same tint as that of the redwood, is extremely thick and is channelled towards the base with vertical furrows; at the root the ridges often stand out in buttress-like projections. Some of these vast vegetable columns are upwards of 30 feet in diameter and a few have attained a height of 400 feet or more.

The famous group known as the Mammoth Grove of Calaveras in California, containing above ninety large trees, stands in 38° N. lat., about 4370 feet above the sea, between the San Antonio and Stanislaus rivers. According to Vischer, it was discovered by a hunter in pursuit of a bear in 1852, but had apparently been visited before, as the date 1850 is cut on one of the trees. The bark of one of the finest trunks was foolishly stripped off to the height of 116 feet, and exhibited in New York and London; it now stands in the Crystal Palace, Sydenham. The tree, known as the "mother of the forest," soon died; at the base it measured 90 feet in girth, and the dead tree was 321 feet high; a prostrate trunk in the neighbourhood is 18 feet in diameter 300 feet from the base. Some trees in the Mariposa grove rival these in size: one measures 101 feet round the root, and a cut stump is 31 feet in diameter. Gigantic as these trees are and imposing from their vast columnar trunks, they have little beauty, owing to the scanty foliage of the short rounded boughs; some of the trees stand very close together; they are said to be about 400 in number. Some are of vast age, perhaps 8000 years or more; they appear to be the remains of extensive woods belonging to a past epoch, and probably have been in distant time much injured by forest fires. The growth of the "mammoth tree" is fast when young, but old trees increase with extreme slowness. The timber is not of great value, but the heartwood is dense and of deeper colour than that of *S. sempervirens*, varying from brownish red to very deep brown; oiled and varnished, it has been used in cabinet work. *S. gigantea* was brought to England by Lobb in 1853, and received from Dr Lindley the name of *Wellingtonia*, by which it is still popularly known, though its affinity to the redwood is too marked to admit of generic distinction. In America it is sometimes called *Washingtonia*. In the Atlantic States it does not succeed; and, though nearly hardy in Great Britain, it is planted only as an ornament of the lawn or paddock. It is never likely to acquire any economic importance in Europe. (C. P. J.)

SERAIEVO. See BOSNA SERAI.

SERAING, a town of Belgium, stretching nearly a mile along the right bank of the Meuse, across which a suspension bridge connects it with Jemeppe, 3 miles southwest of Liège. It has one of the largest manufactories of machinery on the Continent, founded by John Cockerill, an Englishman, in 1817, on the site of the former palace of the prince-bishops of Liège. Including offices, the works extend over 270 acres, employ 11,000 hands, and the annual value of their products is more than 45,000,000 francs. Down to 1882 they had turned out 52,600 engines or pieces of machinery, including the first locomotive engine built on the Continent (1835). After Cockerill's death in 1840, the works were purchased by "La John Cockerill Société." A monument was erected to his memory in 1871. The population, which numbered but 2226 in 1827, amounted to 24,315 in 1877, and is now (1886) estimated at about 27,500.

SERAMPUR, a town of British India, in Hugli (Hooghly) district, Bengal, situated on the right bank of the Hugli river, 13 miles by rail north of Calcutta, in 22° 45' 26" N. lat. and 88° 23' 10" E. long. It was formerly a Danish settlement, and remained so until 1845, when all the Danish possessions in India were ceded by treaty to the East India Company. Serampur is famed as the

residence of a body of Protestant Baptist missionaries, who made it the centre of their Christianizing efforts. At the census of 1881 the population of the town was 25,559 (13,137 males and 12,422 females).

SERAPHIM. In the vision of Isaiah vi. the throne of God is surrounded by seraphim,—figures apparently human (ver. 6), but with six wings, which constantly proclaim the *trisagion*. The seraphim are not again mentioned in the Bible; but in later Jewish theology they are taken to be a class of angels. As the whole vision of Isaiah is symbolical, the seraphim also are in this connexion symbolical figures, aiding the delineation of Jehovah's awful holiness. But the imagery is probably borrowed from some popular conception analogous to that of the CHERUBIM (*q.v.*). The name is sometimes explained to mean "lofty ones," after the Arabic *sharafa* (Gesenius); but if it has a Hebrew etymology it must signify "burning ones" ("consuming," not "fiery"), so that in Isaiah's vision the seraphim will mean the same thing as the "devouring fire" of God's holiness (Isa. xxxiii. 14). But this, again, is a spiritual interpretation of the old Hebrew conception that Jehovah appears in the thunderstorm (Judges v. 4; Ps. xviii. xxix.) escorted by thunderbolts (*resheph*, Hab. iii. 5). Among the Phœnicians Resheph is a god (*C.I.S.*, i. 38), probably identical with the Arabian divine archer Kozah, who shoots lightnings. In prophetic monotheism such mythological conceptions could only survive as personifications of the natural phenomena attending a theophany.

In Num. xxi. 6 *sq.* the word "seraphim" is used of a kind of serpents, not "fiery serpents" (A. V.) but burning, *i.e.*, poisonous ones (comp. *hemah*, "glowing heat," "venom"). In Isa. xiv. 29 and xxx. 6 the singular *saraph* occurs with the epithet "flying," and from the second passage we see that such flying serpents were supposed to inhabit the desert between Palestine and Egypt; comp. Herod. ii. 75 and the white flying serpents in an Arabian legend (*Agh.*, xx. 135, 30).

SERAPIS, or SARAPIS, in the Leyden papyrus *Ὀσαράπης*, *i.e.*, Osiris-Apis, apparently meaning the dead Apis worshipped as Osiris (see APIS), and so as lord of the underworld, was the name under which the Egyptian priests consulted by Ptolemy Soter incorporated with the old religion the Greek worship of Hades. The statue with the attributes of Hades which they professed to identify as Serapis (a name which had till then played no prominent part in Egyptian religion) was brought by the king from Sinope to Alexandria in consequence, it was given out, of a revelation granted to him in a dream (Plut., *Is. et Os.*, 28). The real object of Ptolemy was to provide a mixed Greek and Egyptian religion for his mixed subjects, especially in Alexandria; the true Egyptians disliked the innovation, and no Serapeum or Serapis temple was admitted within the walls of Egyptian cities (Macrob., i. 7, 14). Thus the great Serapeum at Memphis lay outside the town (Strabo, xvii. 1, 32), where its ruins were laid bare by Mariette in 1850. From papyri found on the spot it is known that a sort of monastery was connected with this and other Serapea. The so-called Egyptian Serapeum or series of Apis graves excavated in the rock near the Greek Serapeum is distinct and belongs to the old religion, though the old Osiris worship was gradually transferred to Serapis. The cult of Serapis also spread largely in the Græco-Roman world. Egyptian monasticism seems to have borrowed something from the monks of Serapis, and the Egyptian Christians were accused of worshipping Serapis as well as Christ (*Vita Saturnini*, 8), perhaps because they identified the god who is represented bearing a corn-measure on his head with the Biblical Joseph; see Firmicus Maternus, c. 13, and Suidas, *s.v.* Σάραπης.

SERENA, a city of Chili, capital of the province of Coquimbo, is situated on an elevated plain on the south side of the river Coquimbo, about 5 miles from the sea, in 29° 54' S. lat. and 71° 13' W. long. The original town

was founded by Juan Bohon in 1544, on the opposite side of the river, and called by him Serena, after the town of that name in Spanish Estremadura, the birthplace of his chief, Pedro de Valdivia. Being shortly after destroyed by the Indians, it was rebuilt on its present site by Francisco de Aguirre in 1549. Serena is the seat of a bishopric embracing the whole of Chili to the north, and of a court of appeal the jurisdiction of which extends to the province of Atacama. The town is well supplied with water. The principal edifice is the cathedral (1844-60), built of a light porous stone, 216 feet long and 66 broad. The town contains eight other churches, an excellent lyceum, a theatre, an episcopal palace, and several convents and charitable institutions. It is connected by rail with its port 9 miles to the south-west, and with the Tamaya copper-mines. A narrow-gauge line up the Elqui valley was opened in 1883. Brewing has recently become an important industry. The population of Serena was 12,293 in 1875, or, including the suburbs of the Pampa (Alta and Baja), 14,403.

SERENUS OF ANTISSEA, an ancient Greek geometer, the author of two treatises—*De Sectione Cylindri et Coni, libri duo*—which Halley has published in Greek and Latin along with his edition of the *Conics* of Apollonius of Perga. Great difference of opinion has existed as to his date: Halley says in his preface to the *Conics*, "We know nothing of Serenus except that he was born at Antissea, a town in the island of Lesbos; and that, besides his book *On the Section of the Cylinder*, and another *On the Section of the Cone*, he wrote commentaries on Apollonius; and that he lived before Marinus—the pupil of Proclus—as appears from the preface of Marinus to the *Data* of Euclid." Montucla says vaguely that Serenus lived within the first four centuries of the Christian era. Chasles places him about the same time as Pappus. Bretschneider pointed out that Antissea was completely destroyed by the Romans in 167 B.C., and inferred thence that Serenus lived c. 220-180 B.C. To this inference it has been fairly objected by Cantor, after F. Blass, that the name Serenus is Latin and that Antissea had been rebuilt at the time of Strabo. The statement of Halley that "he lived before Marinus" has been since repeated by many writers; but Heiberg has pointed out (*Rev. Crit. d'Hist. et de Litt.*, 1881, p. 381) that the passage referred to in support of this statement is faulty, and that the name of Serenus is certainly not to be found in it. Th. H. Martin, in his edition of the *Astronomy* of Theon of Smyrna (Paris, 1849), has published a fragment which in the MS. follows the text of Theon and is headed *From the Lemmas of the Philosopher Serenus*. This is unquestionably the same as Serenus of Antissea, to whom this appellation "philosopher" is given in the titles of the two treatises edited by Halley. No conclusion, however, can be drawn from this as to the date of Serenus, for the extract is not given by Theon but by an anonymous scholiast. M. Paul Tannery in an elaborate paper (*Bull. des Sc. Math. et Astron.*, 2d series, vii., 1883) has shown from the character of Serenus's writings that he lived long after the brilliant period of Greek mathematics, and that he must be placed chronologically between Pappus and Hypatia, consequently in the 4th century. This determination of the date of Serenus is accepted by Cantor (*Zeitschrift für Math. und Phys.*, August 1885, p. 124).

In the treatise *On the Section of the Cone*, which is the less important of the two books, Serenus, as he tells us in the preface, was the first to take up the particular branch of that subject with which he deals. In it he treats of the area of a triangle formed by cutting a cone, right or scalene, on a circular base by a plane through the vertex. He shows how "to cut a right cone whose axis is not less than the semi-diameter of the base by a plane through the vertex so that the triangle thus formed shall be equal to a given triangle" (Prop. 8), or "a maximum" (Prop. 13). He then considers the case of the scalene cone, solves the problem "to cut a given scalene cone by a plane through the vertex so as

to form an isosceles triangle" (Prop. 21), and shows that, "of the triangles which are formed by cutting a scalene cone through the axis, the greatest is the isosceles, the least that which is at right angles to the base of the cone; of the rest, however, that which is nearer the greatest is greater than one more remote" (Prop. 22). The general questions for a scalene cone, corresponding to the problems for the right cone (Props. 8 and 13), and which depend on solid loci for their solution, are not attempted. These have been solved by Halley in his edition of Serenus, p. 68 sq.

In his preface to the treatise *On the Section of the Cylinder*, Serenus tells us that many geometers of his time supposed that the transverse sections of a cylinder were different from the elliptic sections of a cone, that he thought it right to refute this error and to prove that these sections were of the same kind. Having established this in a series of theorems ending with Prop. 13, he shows in Prop. 19 that "it is possible to exhibit a cone and a cylinder cutting one another in one and the same ellipse." He then solves problems such as—"given a cone (cylinder) and an ellipse on it, to find the cylinder (cone) which is cut in the same ellipse as the cone (cylinder)" (Props. 20, 21); "given a cone (cylinder), to find a cylinder (cone), and to cut both by one and the same plane so that the sections thus formed shall be similar ellipses" (Props. 22, 23); "given a cylinder cut in an ellipse, to construct a cone having the same base and altitude as the cylinder, so that the section of it by the same plane is an ellipse similar to the ellipse of the cylinder" (Prop. 25). In Props. 26-29 he shows how to cut a scalene cylinder or cone in an infinite number of ways by two planes—which are not parallel—so as to form similar ellipses (subcontrary sections). He then gives some theorems: "all the straight lines drawn from the same point to touch a cylindrical surface, on both sides, have their points of contact on the sides of a single parallelogram" (Prop. 31); "all the straight lines drawn from the same point to touch a conical surface, on both sides, have their points of contact on the sides of a single triangle" (Prop. 34). This last is proved by means of Prop. 33, where we find, indirectly stated, the property of an harmonic pencil.

SERES, SERRES, or SIROS, a town of Turkey in Europe, now at the head of a sanjak in the vilayet of Saloniki, is situated in the valley of the Strymon (Karasu), in a district so fertile as to bear among the Turks the name of Altin Ovassi or Golden Plain, and so thickly studded with villages as to have, when seen from the heights of Rhodope, the appearance of a great city with extensive gardens. The principal buildings are the Greek archiepiscopal palace, the Greek cathedral, restored since the great fire of 1879, by which it was robbed of its magnificent mosaics and woodwork, the Greek gymnasium and hospital (the former built of marble), the richly endowed Eski Jami, and the ruins of the once no less flourishing Ahmed Pasha or Aghia Sophia mosque, whose revenues used to be derived from the Crimea. On a hill above the town are the ruins of a fortress described in a Greek inscription as a "tower, built by Helen in the mountainous region." Cloth-factories and tanneries are the chief industrial establishments and lignite mines are worked in the neighbourhood with some success. The population is 30,000.

Seres is the ancient Seris, Siræ, or Sirrhæ, mentioned by Herodotus in connexion with Xerxes's retreat, and by Livy as the place where Æmilius Paulus received a deputation from Perseus. In the 14th century, when Stephen Dushan of Servia assumed the title emperor of Servia, &c., he chose Sirrhæ as his capital; and it remained in the hands of the Servians till its capture by Sultan Murad. In 1396 Bayazid summoned his Christian vassals to his camp at Sirrhæ.

SERFDOM. See SLAVERY.

SERGHIEVSKIY POSAD, or TROITZE-SERGHIEVSK, a town of Russia, in the government of Moscow, which has grown up round the monastery of Troitse-Serghievskaya Lavra, 44 miles by rail to the north-east of Moscow. It is situated in a beautiful country, intersected by pleasant little valleys and varied with woods, the buildings extending partly over the hill occupied by the monastery and partly over the valley below. Including the extensive Kukevsk suburbs, it had in 1884 31,400 inhabitants. There are several lower-grade schools, an infirmary for old women, and a school for girls. Numerous inns and hotels, some maintained by the monastery and others a rich source of revenue to it, accommodate the numerous pilgrims.

Serghievsk has long been renowned for its manufactures of holy pictures (painted and carved), spoons, and a variety of other articles carved in wood, especially toys, sold to pilgrims. Within the last twenty years this industry has greatly developed; separate parts of certain toys are made elsewhere and brought to Serghievsk, where no fewer than 330 workshops, employing 1055 hands, with an annual production valued at more than £30,000, supply the finished article. Several other petty industries are carried on both in the town and in the neighbouring villages.

The Troitsk monastery is the most sacred place in middle Russia, the Great Russians regarding it with more veneration than even the cathedrals and relics of the Kremlin of Moscow. It occupies a picturesque site on the top of a hill, protected on two sides by deep ravines and steep slopes. The walls, 25 to 50 feet in height, are fortified by nine towers, one of which, the Pyatnitsk, has been for some time a prison for both civil and ecclesiastical offenders. Eleven churches, including the Troitskiy (Trinity) and Uspenskiy cathedrals, a lofty bell-tower, a theological academy, various buildings for monks and pilgrims, and a hospital stand within the precincts, which are nearly two-thirds of a mile in circuit. A small wooden church, erected by the monk Sergius, and afterwards burned by the Tatars, stood on the site now occupied by the cathedral of the Trinity, which was built in 1422, and contains the relics of Sergius, as well as a holy picture which has frequently been brought into requisition in Russian campaigns. The Uspenskiy cathedral was erected in 1585; close beside it are the graves of Boris Godunoff and his family. In the southern part of the monastery is the church of Sergius, beneath which are spacious rooms where 200,000 dinners are distributed gratis every year to the pilgrims. The bell-tower, 290 feet high, has a bell weighing 137½ tons. Several monasteries of less importance occur in the neighbourhood. The site now occupied by the Troitsk monastery was in the 14th century covered with impenetrable forests. In 1337 two brothers, Barthelemy and Stefan, sons of a Rostoff *boiar*, erected a church on the spot. The elder (born in 1314) took monastic orders under the name of Sergius, erected cells by the church, and became widely famous among the peasants around. The Moscow princes also showed great respect for the chief of the new monastery. Dmitri Joannovich Donskoi received the benediction of Sergius before setting out on the Tatar expedition which terminated in the victory of Kulikovo, and afterwards accepted the advice and help of the monk in his dealings with the prince of Ryazan. Sergius lived a life of diligence and simplicity, and declined to accept the office of metropolitan of Moscow. His monastery acquired great fame and became the wealthiest in middle Russia. Ivan the Terrible in 1561 made it the centre of the ecclesiastical province of Moscow. During the Polish invasion at the beginning of the 17th century it organized the national resistance, and supplied the combatants with money and food. In 1608-9 it withstood a sixteen months' siege by the Poles; at a later date the monks took a lively part in the organization of the army which crushed the outbreak of the peasants. In 1683 and 1689 Peter I. took refuge here from the revolted *streltzi*. The theological seminary, founded in 1744 and transformed in 1814 into an academy, reckons Platon and Philarete among its pupils.

SERGIUS I., pope from 687 to 701, came of an Antiochene family which had settled at Palermo, and owed his election as Conon's successor to skilful intrigues against Paschalis and Theodorus, the other candidates. In the second year of his pontificate he baptized King Ceadwalla of Wessex at Rome. For rejecting certain canons of the Trullan (Quinisext) council of 692, Justinian II. commanded his arrest and transportation to Constantinople, but the militia of Ravenna and the Pentapolis forced the imperial protospatharius to abandon the attempt to carry out his orders. Sergius was followed by John VI. as pope.

SERGIUS II., pope from 844 to 847, a Roman of noble birth, elected by the clergy and people to succeed Gregory IV., was forthwith consecrated without waiting for the sanction of the emperor Lothair, who accordingly sent his son Louis with an army to punish the breach of faith. A pacific arrangement was ultimately made, and Louis was crowned king of Lombardy by Sergius. In this pontificate Rome was ravaged, and the churches of St Peter and St Paul robbed, by Saracens (August 846). Sergius was succeeded by Leo IV.

SERGIUS III. succeeded Pope Christopher in 904, and reigned till 911. His pontificate, so far as is known, was

remarkable for nothing but the rise of the "pornocracy" of Theodora and her daughters. Sergius restored the Lateran palace, which had been shattered by an earthquake. After him Anastasius III. sat on the pontifical throne.

SERGIUS IV., pope from 1009 to 1012, originally bore the name of Peter, and is said to have been the first to change his name on accession to the pontificate. He was a mere tool in the hands of the feudal nobility of the city (see ROME); he was succeeded by Benedict VIII.

SERGIUS, St. The Eastern and Western Churches celebrate the martyrs Sergius and Bacchus, Roman officers who suffered under Maximian, on 7th October. Both were martyred in Syria, Sergius at Rosáfa (Rasfá, Rosáfát Hishám) near Rakka. Sergius was a very famous saint in Syria and Christian Arabia (comp. what is related of Chosroes II. in vol. xviii. p. 614); and Rosáfa, which became a bishop's see (Le Quien, *Or. Chr.*, ii. 951), took the name of Sergiopolis, and preserved his relics in a fortified basilica. The church was adorned and the place further strengthened by Justinian (Procopius, *Æd.*, ii. 9).

SERIEMA, or CARIAMA,¹ a South-American bird, sufficiently well described and figured in Marcgrave's work (*Hist. Rer. Nat. Brasilæ*, p. 203), posthumously published by De Laet in 1648, to be recognized by succeeding ornithologists, among whom Brisson in 1760 acknowledged it as forming a distinct genus *Cariama*, while Linnæus regarded it as a second species of *Palamedea* (see SCREAMER, vol. xxi. p. 552), under the name of *P. cristata*, Englished by Latham in 1785 (*Synopsis*, v. p. 20) the "Crested Screamer,"—an appellation, as already observed, since transferred to a wholly different bird. Nothing more seems to have been known of it in Europe till 1803, when Azara published at Madrid his observations on the birds

Seriema.

of Paraguay (*Apuntamientos*, No. 340), wherein he gave an account of it under the name of "Saria," which it bore among the Guaranis,—that of "Cariama" being applied to it by the Portuguese settlers, and both expressive of its ordinary cry.² It was not, however, until 1809 that this very remarkable form came to be autoptically described scientifically. This was done by the elder Geoffroy St-

¹ In this word the initial C, as is usual in Portuguese, is pronounced soft, and the accent laid upon the last syllable.

² Yet Forbes states (*Ibis*, 1881, p. 358) that *Seriema* comes from *Siri*, "a diminutive of Indian extraction," and *Ema*, the Portuguese name for the Rhea (comp. EMBU, vol. viii. p. 171), the whole thus meaning "Little Rhea."

Hilaire (*Ann. du Muséum*, xiii. pp. 362-370, pl. 26), who had seen a specimen in the Lisbon museum; and, though knowing it had already been received into scientific nomenclature, he called it anew *Microdactylus marcgravii*. In 1811 Illiger, without having seen an example, renamed the genus *Dicholophus*—a term which, as before stated (ORNITHOLOGY, vol. xviii. p. 46, note 1), has since been frequently applied to it—placing it in the curious congeries of forms having little affinity which he called *Alectorides*. In the course of his travels in Brazil (1815-17), Prince Max of Wied met with this bird, and in 1823 there appeared from his pen (*N. Act. Acad. L.-C. Nat. Curiosorum*, xi. pt. 2, pp. 341-350, tab. xlv.) a very good contribution to its history, embellished by a faithful life-sized figure of its head. The same year Temminck figured it in the *Planches Coloriées* (No. 237). It is not easy to say when any example of the bird first came under the eyes of British ornithologists; but in the Zoological *Proceedings* for 1836 (pp. 29-32) Martin described the visceral and osteological anatomy of one which had been received alive the preceding year.¹

The Seriema, owing to its long legs and neck, stands some two feet or more in height, and in menageries bears itself with a stately deportment. Its bright red beak, the bare greenish blue skin surrounding its large yellow eyes, and the tufts of elongated feathers springing vertically from its lores, give it a pleasing and animated expression; but its plumage generally is of an inconspicuous ochreous grey above and dull white beneath,—the feathers of the upper parts, which on the neck and throat are long and loose, being barred by fine zigzag markings of dark brown, while those of the lower parts are more or less striped. The wing-quills are brownish black, banded with mottled white, and those of the tail, except the middle pair, which are wholly greyish brown, are banded with mottled white at the base and the tip, but dark brown for the rest of their length. The legs are red. The Seriema inhabits the *campos* or elevated open parts of Brazil, from the neighbourhood of Pernambuco to the Rio de la Plata, extending inland as far as Matto Grosso (long. 60°), and occurring also, though sparsely, in Paraguay. It lives in the high grass, running away in a stooping posture to avoid discovery on being approached, and taking flight only at the utmost need. Yet it builds its nest in thick bushes or trees at about a man's height from the ground, therein laying two eggs, which Prof. Burmeister likens to those of the Land-Rail in colour.² The young are hatched fully covered with grey down, relieved by brown, and remain for some time in the nest. The food of the adult is almost exclusively animal,—insects, especially large ants, snails, lizards, and snakes; but it also eats certain large red berries.

Until 1860 the Seriema was believed to be without any near relative in the living world of birds³; but in the Zoological *Proceedings* for that year (pp. 334-336) Dr Hartlaub described an allied species discovered by Prof. Burmeister in the territory of the Argentine Republic.⁴ This bird, which has since been regarded as entitled to generic division under the name of *Chunga burmeisteri* (*P.Z.S.*, 1870, p. 466, pl. xxxvi.), and seems to be known in its native country as the "Chunnia," differs from the Seriema by frequenting forest or at least bushy districts. It is also darker in colour, has less of the frontal crest, shorter legs, a longer tail, and the markings beneath take the form of bars rather than stripes. In other respects the difference between the two birds seems to be immaterial.

There are few birds which have more exercised the taxonomer than this, and the reason seems to be plain. The Seriema must be regarded as the not greatly modified heir of some very old type, such as one may fairly imagine to have lived before many of the existing groups of birds had

become differentiated. Looking at it in this light, we may be prepared to deal gently with the systematists who, having only the present before their eyes, have relegated it positively to this, that, or the other Order, Family, or other group of birds. There can be no doubt that some of its habits point to an alliance with the BUSTARD (vol. iv. p. 578) or perhaps certain Plovers (see PLOVER, vol. xix. p. 227), while its digestive organs are essentially, if not absolutely, those of the HERON (vol. xi. p. 760). Its general appearance recalls that of the SECRETARY-BIRD (*supra*, p. 617); but this, it must be admitted, may be merely an analogy and may indicate no affinity whatever. On the one hand we have authorities, starting from bases so opposed as Prof. Parker (*P.Z.S.*, 1863, p. 516) and Sundevall, placing it among the *Accipitres*,⁵ while on the other we have Nitzsch, Prof. Burmeister,⁶ Martin (*ut supra*), and Dr Gadow (*Journ. f. Ornithologie*, 1876, pp. 445, 446) declaring in effect that this view of its affinities cannot be taken. Prof. Huxley has expressed himself more cautiously, and, while remarking (*P.Z.S.*, 1867, p. 455) that in its skull "the internasal septum is ossified to a very slight extent, and the maxillo-palatine processes may meet in the middle line, in both of which respects it approaches the birds of prey," adds that "the ossified part of the nasal septum does not unite below with the maxillo-palatines," and that in this respect it is unlike the *Accipitres*; finally he declares (p. 457) that, as *Otis* connects the *Geranomorphæ* with the *Charadriomorphæ*, so *Cariama* connects the former with the *Aetomorphæ*, "but it is a question whether these two genera may be better included in" the *Geranomorphæ*, "or made types of separate groups." (A. N.)

SERIES. A series is a set of terms considered as arranged in order. Usually the terms are or represent numerical magnitudes, and we are concerned with the sum of the series. The number of terms may be limited or without limit; and we have thus the two theories, finite series and infinite series. The notions of convergency and divergency present themselves only in the latter theory.

Finite Series.

1. Taking the terms to be numerical magnitudes, or say numbers, if there be a definite number of terms, then the sum of the series is nothing else than the number obtained by the addition of the terms; e.g., $4 + 9 + 10 = 23$, $1 + 2 + 4 + 8 = 15$. In the first example there is no apparent law for the successive terms; in the second example there is an apparent law. But it is important to notice that in neither case is there a determinate law: we can in an infinity of ways form series beginning with the apparently irregular succession of terms 4, 9, 10, or with the apparently regular succession of terms 1, 2, 4, 8. For instance, in the latter case we may have a series with the general term 2^n , when for $n = 0, 1, 2, 3, 4, 5 \dots$ the series will be 1, 2, 4, 8, 16, 32, . . .; or a series with the general

¹ The skeleton has been briefly described and figured by Eyton (*Osteol. Avium*, p. 190, pls. 3, K, and 28 bis, fig. 1).

² This distinguished author twice cites the figure given by Thienemann (*Fortpflanzungsgesch. gesammelt. Vögel*, pl. lxxii. fig. 14) as though taken from a genuine specimen; but little that can be called Ralline in character is observable therein. The same is to be said of an egg laid in captivity at Paris; but a specimen in Mr Walter's possession undeniably shows it (cf. *Proc. Zool. Society*, 1881, p. 2).

³ A supposed fossil *Cariama* from the caves of Brazil, mentioned by Bonaparte (*C.R.*, xliii. p. 779) and others, has since been shown by Reinhardt (*Ibis*, 1882, pp. 321-332) to rest upon the misinterpretation of certain bones, which the latter considers to have been those of a *Rhea*.

⁴ Near Tucuman and Catamarca (Burmeister, *Reise durch die La Plata Staaten*, ii. p. 508).

⁵ The author of vol. i. of the British Museum *Catalogue of Birds* even refers it to the Family *Falconidae* and sub-Family *Polyborinae*, though he regards the OSPREY (vol. xviii. p. 56) as the type of a distinct sub-Order, thereby showing a want of penetration which it is difficult to excuse. Here it needs only be said that, whereas in a few points *Pandion* differs from the normal *Falconidae*, *Cariama* diverges in characters too numerous to mention. The suggestion that the Order *Accipitres* might be justifiably enlarged so as to include the Seriema has before (ORNITHOLOGY, vol. xviii. pp. 45, 46) met with conditional approval; but that this remarkable and peculiar form should be treated in the way just described indicates an amount of neglect of evidence hardly to be expected at the present day.

⁶ Nitzsch, as Prof. Burmeister states in his masterly contribution to the natural history of this bird (*Abhandl. naturf. Gesellsch. Halle*, i. pp. 1-68, pls. 1, 2), in 1834 saw a defective skeleton sent to Munich by the Brazilian travellers Spix and Martius. His description of it was not, however, published until 1858. To it is appended a description by Dr Creplin of some *Entozoa* found in the Seriema, but this unfortunately seems to give no help as to the systematic position of the bird.

term $\frac{1}{6}(n^3 + 5n + 6)$, where for the same values of n the series will be 1, 2, 4, 8, 15, 26, ... The series may contain negative terms, and in forming the sum each term is of course to be taken with the proper sign.

2. But we may have a given law, such as either of those just mentioned, and the question then arises, to find the sum of an indefinite number of terms, or say of n terms (n standing for any positive integer number at pleasure) of the series. The expression for the sum cannot in this case be obtained by actual addition; the formation by addition of the sum of two terms, of three terms, &c., will, it may be, suggest (but it cannot do more than suggest) the expression for the sum of n terms of the series. For instance, for the series of odd numbers $1 + 3 + 5 + 7 + \dots$, we have $1 = 1$, $1 + 3 = 4$, $1 + 3 + 5 = 9$, &c. These results at once suggest the law, $1 + 3 + 5 + \dots + (2n - 1) = n^2$, which is in fact the true expression for the sum of n terms of the series; and this general expression, once obtained, can afterwards be verified.

3. We have here the theory of finite series: the general problem is, u_n being a given function of the positive integer n , to determine as a function of n the sum $u_0 + u_1 + u_2 + \dots + u_n$, or, in order to have n instead of $n + 1$ terms, say the sum $u_0 + u_1 + u_2 + \dots + u_{n-1}$.

Simple cases are the three which follow.

(i.) The arithmetic series,

$$a + (a + b) + (a + 2b) + \dots + (a + (n-1)b);$$

writing here the terms in the reverse order, it at once appears that twice the sum is $= 2a + n - 1b$ taken n times: that is, the sum $= na + \frac{1}{2}n(n-1)b$. In particular we have an expression for the sum of the natural numbers

$$1 + 2 + 3 + \dots + n = \frac{1}{2}n(n+1),$$

and an expression for the sum of the odd numbers

$$1 + 3 + 5 + \dots + (2n-1) = n^2.$$

(ii.) The geometric series,

$$a + ar + ar^2 + \dots + ar^{n-1};$$

here the difference between the sum and r times the sum is at once seen to be $= a - ar^n$, and the sum is thus $= \frac{1 - r^n}{1 - r}$; in particular the sum of the series

$$1 + r + r^2 + \dots + r^{n-1} = \frac{1 - r^n}{1 - r}.$$

(iii.) But the harmonic series,

$$\frac{1}{a} + \frac{1}{a+b} + \frac{1}{a+2b} + \dots + \frac{1}{a+(n-1)b},$$

or say $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$, does not admit of summation; there is no algebraical function of n which is equal to the sum of the series.

4. If the general term be a given function u_n , and we can find v_n a function of n such that $v_{n+1} - v_n = u_n$, then we have $u_0 = v_1 - v_0$, $u_1 = v_2 - v_1$, $u_2 = v_3 - v_2$, ... $u_n = v_{n+1} - v_n$; and hence $u_0 + u_1 + u_2 + \dots + u_n = v_{n+1} - v_0$,—an expression for the required sum. This is in fact an application of the Calculus of Finite Differences. In the notation of this calculus $v_{n+1} - v_n$ is written Δv_n ; and the general inverse problem, or problem of integration, is from the equation of differences $\Delta v_n = u_n$ (where u_n is a given function of n) to find v_n . The general solution contains an arbitrary constant, $v_n = V_n + C$; but this disappears in the difference $v_{n+1} - v_0$. As an example consider the series

$$u_0 + u_1 + \dots + u_n = 0 + 1 + 3 + \dots + \frac{1}{2}n(n+1);$$

here, observing that

$$n(n+1)(n+2) - (n-1)n(n+1) = n(n+1)(n+2 - n - 1) = 3n(n+1),$$

we have

$$v_{n+1} = \frac{1}{6}n(n+1)(n+2);$$

and hence $1 + 3 + 5 + \dots + \frac{1}{2}n(n+1) = \frac{1}{6}n(n+1)(n+2)$,

as may be at once verified for any particular value of n .

Similarly, when the general term is a factorial of the order r , we have

$$1 + \frac{r+1}{1} + \dots + \frac{n(n+1) \dots (n+r-1)}{1.2 \dots r} = \frac{n(n+1) \dots (n+r)}{1.2 \dots (r+1)}.$$

5. If the general term u_n be any rational and integral function of n , we have

$$u_n = u_0 + \frac{n}{1} \Delta u_0 + \frac{n(n-1)}{1.2} \Delta^2 u_0 + \dots + \frac{n(n-1) \dots (n-p+1)}{1.2 \dots p} \Delta^p u_0,$$

where the series is continued only up to the term depending on p , the degree of the function u_n , for all the subsequent terms vanish. The series is thus decomposed into a set of series which have each a factorial for the general term, and which can be summed by the last formula; thus we obtain

$$u_0 + u_1 + \dots + u_n = (n+1)u_0 + \frac{(n+1)n}{1.2} \Delta u_0 + \dots + \frac{(n+1)n(n-1) \dots (n-p+1)}{1.2.3 \dots (p+1)} \Delta^p u_0,$$

which is a function of the degree $p+1$.

Thus for the before-mentioned series $1 + 2 + 4 + 8 + \dots$, if it be assumed that the general term u_n is a cubic function of n , and writing down the given terms and forming the differences, 1, 2, 4, 8; 1, 2, 4; 1, 2; 1, we have

$$u_n = 1 + \frac{n}{1} + \frac{n(n-1)}{1.2} + \frac{n(n-1)(n-2)}{1.2.3} \left\{ = \frac{1}{6}(n^3 + 5n + 6), \text{ as above } \right\};$$

and the sum $u_0 + u_1 + \dots + u_n$

$$= n+1 + \frac{(n+1)n}{1.2} + \frac{(n+1)n(n-1)}{1.2.3} + \frac{(n+1)n(n-1)(n-2)}{1.2.3.4} \\ = \frac{1}{24}(n^4 + 2n^3 + 11n^2 + 34n + 24).$$

As particular cases we have expressions for the sums of the powers of the natural numbers—

$$1^2 + 2^2 + \dots + n^2 = \frac{1}{6}n(n+1)(2n+1); \quad 1^3 + 2^3 + \dots + n^3 = \frac{1}{4}n^2(n+1)^2$$

(observe that this $= (1 + 2 + \dots + n)^2$); and so on.

6. We may, from the expression for the sum of the geometric series, obtain by differentiation other results:

thus $1 + r + r^2 + \dots + r^{n-1} = \frac{1 - r^n}{1 - r}$ gives

$$1 + 2r + 3r^2 + \dots + (n-1)r^{n-2} = \frac{d}{dr} \frac{1 - r^n}{1 - r} = \frac{1 - nr^{n-1} + (n-1)r^n}{(1-r)^2};$$

and we might in this way find the sum $u_0 + u_1 + \dots + u_n$, where u_n is any rational and integral function of n .

7. The expression for the sum $u_0 + u_1 + \dots + u_n$ of an indefinite number of terms will in many cases lead to the sum of the infinite series $u_0 + u_1 + \dots$; but the theory of infinite series requires to be considered separately. Often in dealing apparently with an infinite series $u_0 + u_1 + \dots$ we consider rather an indefinite than an infinite series, and are not in any wise really concerned with the sum of the series or the question of its convergency: thus the equation

$$\left(1 + mx + \frac{m(m-1)}{1.2}x^2 + \dots\right) \left(1 + nx + \frac{n(n-1)}{1.2}x^2 + \dots\right) \\ = 1 + (m+n)x + \frac{(m+n)(m+n-1)}{1.2}x^2 + \dots$$

really means the series of identities

$$(m+n) = m+n \\ \frac{(m+n)(m+n-1)}{1.2} = \frac{m(m-1)}{1.2} + 2 \frac{m}{1} \frac{n}{1} + \frac{n(n-1)}{1.2}, \text{ &c.,}$$

obtained by multiplying together the two series of the left-hand side. Again, in the method of generating functions we are concerned with an equation $\phi(t) = A_0 + A_1t + \dots + A_nt^n + \dots$, where the function $\phi(t)$ is used only to express the law of formation of the successive coefficients.

It is an obvious remark that, although according to the original definition of a series the terms are considered as arranged in a determinate order, yet in a finite series

(whether the number of terms be definite or indefinite) the sum is independent of the order of arrangement.

Infinite Series.

8. We consider an infinite series $u_0 + u_1 + u_2 + \dots$ of terms proceeding according to a given law, that is, the general term u_n is given as a function of n . To fix the ideas the terms may be taken to be positive numerical magnitudes, or say numbers continually diminishing to zero; that is, $u_n > u_{n+1}$, and u_n is, moreover, such a function of n that by taking n sufficiently large u_n can be made as small as we please.

Forming the successive sums $S_0 = u_0$, $S_1 = u_0 + u_1$, $S_2 = u_0 + u_1 + u_2$, ... these sums S_0, S_1, S_2, \dots will be a series of continually increasing terms, and if they increase up to a determinate finite limit S (that is, if there exists a determinate numerical magnitude S such that by taking n sufficiently large we can make $S - S_n$ as small as we please) S is said to be the sum of the infinite series. To show that we can actually have an infinite series with a given sum S , take u_0 any number less than S , then $S - u_0$ is positive, and taking u_1 any numerical magnitude less than $S - u_0$, then $S - u_0 - u_1$ is positive. And going on continually in this manner we obtain a series $u_0 + u_1 + u_2 + \dots$ such that for any value of n however large $S - u_0 - u_1 - \dots - u_n$ is positive; and if as n increases this difference diminishes to zero, we have $u_0 + u_1 + u_2 + \dots$,—an infinite series having S for its sum. Thus, if $S = 2$, and we take $u_0 < 2$, say $u_0 = 1$; $u_1 < 2 - 1$, say $u_1 = \frac{1}{2}$; $u_2 < 2 - 1 - \frac{1}{2}$, say $u_2 = \frac{1}{4}$; and so on, we have $1 + \frac{1}{2} + \frac{1}{4} + \dots = 2$; or, more generally, if r be any positive number less than 1, then $1 + r + r^2 + \dots = \frac{1}{1-r}$, that is, the infinite geometric series with the first term = 1, and with a ratio $r < 1$, has the finite sum $\frac{1}{1-r}$. This in fact follows from

the expression $1 + r + r^2 + \dots + r^{n-1} = \frac{1-r^n}{1-r}$ for the sum of the finite series; taking $r < 1$, then as n increases r^n decreases to zero, and the sum becomes more and more nearly $\frac{1}{1-r}$.

9. An infinite series of positive numbers can, it is clear, have a sum only if the terms continually diminish to zero; but it is not conversely true that, if this condition be satisfied, there will be a sum. For instance, in the case of the harmonic series $1 + \frac{1}{2} + \frac{1}{3} + \dots$ it can be shown that by taking a sufficient number of terms the sum of the finite series may be made as large as we please. For, writing the series in the form $1 + \frac{1}{2} + \left(\frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}\right) + \dots$, the number of terms in the brackets being doubled at each successive step, it is clear that the sum of the terms in any bracket is always $> \frac{1}{2}$; hence by sufficiently increasing the number of brackets the sum may be made as large as we please. In the foregoing series, by grouping the terms in a different manner $1 + \left(\frac{1}{2} + \frac{1}{3}\right) + \left(\frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7}\right) + \dots$, the sum of the terms in any bracket is always < 1 ; we thus arrive at the result that ($n = 3$ at least) the sum of 2^n terms of the series is $> 1 + \frac{1}{2^n}$ and $< n$.

10. An infinite series may contain negative terms; suppose in the first instance that the terms are alternately positive and negative. Here the absolute magnitudes of the terms must decrease down to zero, but this is a suffi-

cient condition in order that the series may have a sum. The case in question is that of a series $v_0 - v_1 + v_2 - \dots$, where v_0, v_1, v_2, \dots are all positive and decrease down to zero. Here, forming the successive sums $S_0 = v_0$, $S_1 = v_0 - v_1$, $S_2 = v_0 - v_1 + v_2$, ... S_0, S_1, S_2, \dots are all positive, and we have $S_0 > S_1$, $S_1 < S_2$, $S_2 > S_3$, ... and $S_{n+1} - S_n$ tends continually to zero. Hence the sums S_0, S_1, S_2, \dots tend continually to a positive limit S in such wise that S_0, S_2, S_4, \dots are each of them greater and S_1, S_3, S_5, \dots are each of them less than S ; and we thus have S as the sum of the series. The series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ will serve as

an example. The case just considered includes the apparently more general one where the series consists of alternate groups of positive and negative terms respectively; the terms of the same group may be united into a single term $\pm v_n$, and the original series will have a sum only if the resulting series $v_0 - v_1 + v_2 - \dots$ has a sum, that is, if the positive partial sums v_0, v_1, v_2, \dots decrease down to zero.

The terms at the beginning of a series may be irregular as regards their signs; but, when this is so, all the terms in question (assumed to be finite in number) may be united into a single term, which is of course finite, and instead of the original series only the remaining terms of the series need be considered. Every infinite series whatever is thus substantially included under the two forms,—terms all positive and terms alternately positive and negative.

11. In brief, the sum (if any) of the infinite series $u_0 + u_1 + u_2 + \dots$ is the finite limit (if any) of the successive sums $u_0, u_0 + u_1, u_0 + u_1 + u_2, \dots$; if there is no such limit, then there is no sum. Observe that the assumed order u_0, u_1, u_2, \dots of the terms is part of and essential to the definition; the terms in any other order may have a different sum, or may have no sum. A series having a sum is said to be "convergent"; a series which has no sum is "divergent."

If a series of positive terms be convergent, the terms cannot, it is clear, continually increase, nor can they tend to a fixed limit: the series $1 + 1 + 1 + \dots$ is divergent. For the convergency of the series it is necessary (but, as has been shown, not sufficient) that the terms shall decrease to zero. So, if a series with alternately positive and negative terms be convergent, the absolute magnitudes cannot, it is clear, continually increase. In reference to such a series Abel remarks, "Peut-on imaginer rien de plus horrible que de débiter $0 = 1^n - 2^n + 3^n - 4^n + \dots$, &c., où n est un nombre entier positif?" Neither is it allowable that the absolute magnitudes shall tend to a fixed limit. The so-called "neutral" series $1 - 1 + 1 - 1 + \dots$ is divergent: the successive sums do not tend to a determinate limit, but are alternately $+1$ and 0 ; it is necessary (and also sufficient) that the absolute magnitudes shall decrease to zero.

In the so-called semi-convergent series we have an equation of the form $S = U_0 - U_1 + U_2 - \dots$, where the positive values U_0, U_1, U_2, \dots decrease to a minimum value, suppose U_p , and afterwards increase; the series is divergent and has no sum, and thus S is not the sum of the series. S is only a number or function calculable approximately by means of the series regarded as a finite series terminating with the term $\pm U_p$. The successive sums $U_0, U_0 - U_1, U_0 - U_1 + U_2, \dots$ up to that containing $\pm U_p$, give alternately superior and inferior limits of the number or function S .

12. The condition of convergency may be presented under a different form: let the series $u_0 + u_1 + u_2 + \dots$ be convergent, then, taking m sufficiently large, the sum is the limit not only of $u_0 + u_1 + \dots + u_m$ but also of $u_0 + u_1 + \dots + u_{m+r}$, where r is any number as large as we please. The difference of these two expressions must therefore be in-

definitely small; by taking m sufficiently large the sum $u_{m+1} + u_{m+2} + \dots + u_{m+r}$ (where r is any number however large) can be made as small as we please; or, as this may also be stated, the sum of the infinite series $u_{m+1} + u_{m+2} + \dots$ can be made as small as we please. If the terms are all positive (but not otherwise), we may take, instead of the entire series $u_{m+1} + u_{m+2} + \dots$, any set of terms (not of necessity consecutive terms) subsequent to u_m ; that is, for a convergent series of positive terms the sum of any set of terms subsequent to u_m can, by taking m sufficiently large, be made as small as we please.

13. It follows that in a convergent series of positive terms the terms may be grouped together in any manner so as to form a finite number of partial series which will be each of them convergent, and such that the sum of their sums will be the sum of the given series. For instance, if the given series be $u_0 + u_1 + u_2 + \dots$, then the two series $u_0 + u_2 + u_4 + \dots$ and $u_1 + u_3 + \dots$ will each be convergent and the sum of their sums will be the sum of the original series.

14. Obviously the conclusion does not hold good in general for series of positive and negative terms: for instance, the series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ is convergent, but the

two series $1 + \frac{1}{3} + \frac{1}{5} + \dots$ and $-\frac{1}{2} - \frac{1}{4} - \dots$ are each divergent, and thus without a sum. In order that the conclusion may be applicable to a series of positive and negative terms the series must be "absolutely convergent," that is, it must be convergent when all the terms are made positive. This implies that the positive terms taken by themselves are a convergent series, and also that the negative terms taken by themselves are a convergent series. It is hardly necessary to remark that a convergent series of positive terms is absolutely convergent. The question of the convergency or divergency of a series of positive and negative terms is of less importance than the question whether it is or is not absolutely convergent. But in this latter question we regard the terms as all positive, and the question in effect relates to series containing positive terms only.

15. Consider, then, a series of positive terms $u_0 + u_1 + u_2 + \dots$; if they are increasing—that is, if in the limit u_{n+1}/u_n be greater than 1—the series is divergent, but if less than 1 the series is convergent. This may be called a first criterion; but there is the doubtful case where the limit = 1. A second criterion was given by Cauchy and Raabe; but there is here again a doubtful case when the limit considered = 1. A succession of criteria was established by De Morgan, which it seems proper to give in the original form; but the equivalent criteria established by Bertrand are somewhat more convenient. In what follows $\log x$ is for shortness written to denote the logarithm of x , no matter to what base. De Morgan's form is as follows:—

Writing $u_n = \frac{1}{\phi(n)}$, put $p_0 = \frac{x\phi'x}{\phi x}$; if for $x = \infty$ the limit α_0 of p_0 be greater than 1 the series is convergent, but if less than 1 it is divergent. If the limit $\alpha_0 = 1$, seek for the limit of $p_1 = (p_0 - 1)\log x$; if this limit α_1 be greater than 1 the series is convergent, but if less than 1 it is divergent. If the limit $\alpha_1 = 1$, seek for the limit $p_2 = (p_1 - 1)\log x$; if this limit α_2 be greater than 1 the series is convergent, but if less than 1 it is divergent. And so on indefinitely.

16. Bertrand's form is:—If, in the limit for $n = \infty$, $\log \frac{1}{u_n} / \log n$ be negative or less than 1 the series is divergent, but if greater than 1 it is convergent. If it = 1, then if $\log \frac{1}{nu_n} / \log n$ be negative or less than 1 the series is divergent, but if

greater than 1 it is convergent. If it = 1, then if $\log \frac{1}{nu_n \log n} / \log n$ be negative or less than 1 the series is divergent, but if greater than 1 it is convergent. And so on indefinitely.

The last-mentioned criteria follow at once from the theorem that the several series having the general terms

$\frac{1}{n^a}$, $\frac{1}{n(\log n)^a}$, $\frac{1}{n \log n (\log n)^a}$, $\frac{1}{n \log n \log n (\log n)^a}$, ... respectively are each of them convergent if a be greater than 1, but divergent if a be negative or less than 1 or = 1. In the simplest case, series with the general term $\frac{1}{n^a}$, the theorem may be

proved nearly in the manner in which it is shown above (cf. § 9) that the harmonic series is divergent.

17. Two or more absolutely convergent series may be added together, $\{u_0 + u_1 + u_2 + \dots\} + \{v_0 + v_1 + v_2 + \dots\} = \{u_0 + v_0 + (u_1 + v_1) + \dots\}$; that is, the resulting series is absolutely convergent and has for its sum the sum of the two sums. And similarly two or more absolutely convergent series may be multiplied together $\{u_0 + u_1 + u_2 + \dots\} \times \{v_0 + v_1 + v_2 + \dots\} = u_0 v_0 + (u_0 v_1 + u_1 v_0) + (u_0 v_2 + u_1 v_1 + u_2 v_0) + \dots$; that is, the resulting series is absolutely convergent and has for its sum the product of the two sums. But more properly the multiplication gives rise to a doubly infinite series—

$$\begin{array}{cccc} u_0 v_0, & u_0 v_1, & u_0 v_2, & \dots \\ u_1 v_0, & u_1 v_1, & u_1 v_2, & \dots \\ & \vdots & & \end{array}$$

—which is a kind of series which will be presently considered.

18. But it is in the first instance proper to consider a single series extending backwards and forwards to infinity, or say a back-and-forwards infinite series $\dots u_{-2} + u_{-1} + u_0 + u_1 + u_2 + \dots$; such a series may be absolutely convergent, and the sum is then independent of the order of the terms, and in fact equal to the sum of the sums of the two series $u_0 + u_1 + u_2 + \dots$ and $u_{-1} + u_{-2} + u_{-3} + \dots$ respectively. But, if not absolutely convergent, the expression has no definite meaning until it is explained in what manner the terms are intended to be grouped together; for instance, the expression may be used to denote the foregoing sum of two series, or to denote the series $u_0 + (u_1 + u_{-1}) + (u_2 + u_{-2}) + \dots$ and the sum may have different values, or there may be no sum, accordingly.

Thus, if the series be $\dots -\frac{1}{2} - \frac{1}{1} + 0 + \frac{1}{1} + \frac{1}{2} + \dots$, in the former meaning the two series $0 + \frac{1}{1} + \frac{1}{2} + \dots$ and $-\frac{1}{1} - \frac{1}{2} - \dots$ are each divergent, and there is not any sum. But in the latter meaning the series is $0 + 0 + 0 + \dots$, which has a sum = 0. So, if the series be taken to denote the limit of $(u_0 + u_1 + u_2 + \dots + u_m) + (u_{-1} + u_{-2} + \dots + u_{-m'})$, where m, m' are each of them ultimately infinite, there may be a sum depending on the ratio $m:m'$, which sum consequently acquires a determinate value only when this ratio is given.

19. In a singly infinite series we have a general term u_n , where n is an integer positive in the case of an ordinary series, and positive or negative in the case of a back-and-forwards series. Similarly for a doubly infinite series we have a general term $u_{m,n}$, where m, n are integers which may be each of them positive, and the form of the series is then

$$\begin{array}{cccc} u_{0,0}, & u_{0,1}, & u_{0,2}, & \dots \\ u_{1,0}, & u_{1,1}, & u_{1,2}, & \dots \\ & \vdots & & \end{array}$$

or they may be each of them positive or negative. The latter is the more general supposition, and includes the former, since $u_{m,n}$ may = 0 for m or n each or either of them negative. To put a definite meaning on the notion of a sum, we may regard m, n as the rectangular coordinates of a point in a plane; that is, if m, n are each of

them positive we attend only to the positive quadrant of the plane, but otherwise to the whole plane; and we have thus a doubly infinite system or lattice-work of points. We may imagine a boundary depending on a parameter T which for $T = \infty$ is at every point thereof at an infinite distance from the origin; for instance, the boundary may be the circle $x^2 + y^2 = T$, or the four sides of a rectangle, $x = \pm \alpha T$, $y = \pm \beta T$. Suppose the form is given and the value of T , and let the sum $\sum u_{m,n}$ be understood to denote the sum of those terms $u_{m,n}$ which correspond to points within the boundary, then, if as T increases without limit the sum in question continually approaches a determinate limit (dependent, it may be, on the form of the boundary), for such form of boundary the series is said to be convergent, and the sum of the doubly infinite series is the aforesaid limit of the sum $\sum u_{m,n}$. The condition of convergency may be otherwise stated: it must be possible to take T so large that the sum $\sum u_{m,n}$ for all terms $u_{m,n}$ which correspond to points outside the boundary shall be as small as we please.

It is easy to see that, if the terms $u_{m,n}$ be all of them positive, and the series be convergent for any particular form of boundary, it will be convergent for any other form of boundary, and the sum will be the same in each case. Thus, let the boundary be in the first instance the circle $x^2 + y^2 = T$; by taking T sufficiently large the sum $\sum u_{m,n}$ for points outside the circle may be made as small as we please. Consider any other form of boundary—for instance, an ellipse of given excentricity,—and let such an ellipse be drawn including within it the circle $x^2 + y^2 = T$. Then the sum $\sum u_{m,n}$ for terms $u_{m,n}$ corresponding to points outside the ellipse will be smaller than the sum for points outside the circle, and the difference of the two sums—that is, the sum for points outside the circle and inside the ellipse—will also be less than that for points outside the circle, and can thus be made as small as we please. Hence finally the sum $\sum u_{m,n}$, whether restricted to terms $u_{m,n}$ corresponding to points inside the circle or to terms corresponding to points inside the ellipse, will have the same value, or the sum of the series is independent of the form of the boundary. Such a series, viz., a doubly infinite convergent series of positive terms, is said to be absolutely convergent; and similarly a doubly infinite series of positive and negative terms which is convergent when the terms are all taken as positive is absolutely convergent.

20. We have in the preceding theory the foundation of the theorem (§ 17) as to the product of two absolutely convergent series. The product is in the first instance expressed as a doubly infinite series; and, if we sum this for the boundary $x + y = T$, this is in effect a summation of the series $u_0 v_0 + (u_0 v_1 + u_1 v_0) + \dots$, which is the product of the two series. It may be further remarked that, starting with the doubly infinite series and summing for the rectangular boundary $x = \alpha T$, $y = \beta T$, we obtain the sum as the product of the sums of the two single series. For series not absolutely convergent the theorem is not true. A striking instance is given by Cauchy: the series $1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{4}} + \dots$ is convergent and has a calculable sum, but it can be shown without difficulty that its square, viz., the series $1 - \frac{2}{\sqrt{2}} + \left(\frac{2}{\sqrt{3}} + \frac{1}{2}\right) - \dots$, is divergent.

21. The case where the terms of a series are imaginary comes under that where they are real. Suppose the general term is $p_n + q_n i$, then the series will have a sum, or will be convergent, if and only if the series having for its general term p_n and the series having for its general term q_n be each convergent; then the sum = sum of first series + i into sum of second series. The notion of absolute conver-

gence will of course apply to each of the series separately; further, if the series having for its general term the modulus $\sqrt{p_n^2 + q_n^2}$ be convergent (that is, absolutely convergent, since the terms are all positive), each of the component series will be absolutely convergent; but the condition is not necessary for the convergence, or the absolute convergence, of the two component series respectively.

22. In the series thus far considered the terms are actual numbers, or are at least regarded as constant; but we may have a series $u_0 + u_1 + u_2 + \dots$ where the successive terms are functions of a parameter z ; in particular we may have a series $a_0 + a_1 z + a_2 z^2 + \dots$ arranged in powers of z . It is in view of a complete theory necessary to consider z as having the imaginary value $x + iy = r(\cos \phi + i \sin \phi)$. The two component series will then have the general terms $a_n r^n \cos n\phi$ and $a_n r^n \sin n\phi$ respectively; accordingly each of these series will be absolutely convergent for any value whatever of ϕ , provided the series with the general term $a_n r^n$ be absolutely convergent. Moreover, the series, if thus absolutely convergent for any particular value R of r , will be absolutely convergent for any smaller value of r , that is, for any value of $x + iy$ having a modulus not exceeding R ; or, representing as usual $x + iy$ by the point whose rectangular coordinates are x, y , the series will be absolutely convergent for any point whatever inside or on the circumference of the circle having the origin for centre and its radius = R . The origin is of course an arbitrary point. Or, what is the same thing, instead of a series in powers of z , we may consider a series in powers of $z - c$ (where c is a given imaginary value = $\alpha + \beta i$). Starting from the series, we may within the aforesaid limit of absolute convergency consider the series as the definition of a function of the variable z ; in particular the series may be absolutely convergent for every finite value of the modulus, and we have then a function defined for every finite value whatever $x + iy$ of the variable. Conversely, starting from a given function of the variable, we may inquire under what conditions it admits of expansion in a series of powers of z (or $z - c$), and seek to determine the expansion of the function in a series of this form. But in all this, however, we are travelling out of the theory of series into the general theory of functions.

23. Considering the modulus r as a given quantity and the several powers of r as included in the coefficients, the component series are of the forms $a_0 + a_1 \cos \phi + a_2 \cos 2\phi + \dots$ and $a_1 \sin \phi + a_2 \sin 2\phi + \dots$ respectively. The theory of these trigonometrical or multiple sine and cosine series, and of the development, under proper conditions, of an arbitrary function in series of these forms, constitutes an important and interesting branch of analysis.

24. In the case of a real variable z , we may have a series $a_0 + a_1 z + a_2 z^2 + \dots$, where the series $a_0 + a_1 + a_2 + \dots$ is a divergent series of decreasing positive terms (or as a limiting case where this series is $1 + 1 + 1 + \dots$). For a value of z inferior but indefinitely near to ± 1 , say $z = \pm(1 - \epsilon)$, where ϵ is indefinitely small and positive, the series will be convergent and have a determinate sum $\phi(z)$, and we may write $\phi(\pm 1)$ to denote the limit of $\phi(\pm(1 - \epsilon))$ as ϵ diminishes to zero; but unless the series be convergent for the value $z = \pm 1$ it cannot for this value have a sum, nor consequently a sum = $\phi(\pm 1)$. For instance, let the series be $z + \frac{z^2}{2} + \frac{z^3}{3} + \dots$, which for values of z between the limits ± 1 (both limits excluded) = $-\log(1 - z)$. For $z = +1$ the series is divergent and has no sum; but for $z = 1 - \epsilon$ as ϵ diminishes to zero we have $-\log \epsilon$ and $(1 - \epsilon) + \frac{1}{2}(1 - \epsilon)^2 + \dots$, each positive and increasing without limit; for $z = -1$ the series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$ is convergent, and we have at

the limit $\log 2 = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} \dots$. As a second example, consider the series $1 + z + z^2 \dots$, which for values of z between the limits ± 1 (both limits excluded) $= \frac{1}{1-z}$. For $z = +1$, the series is divergent and has no sum; but for $z = 1 - \epsilon$ as ϵ diminishes to zero we have $\frac{1}{\epsilon}$ and $1 + (1 - \epsilon) + (1 - \epsilon)^2 \dots$, each positive and increasing without limit; for $z = -1$ the series is divergent and has no sum; the equation $\frac{1}{2 - \epsilon} = 1 - (1 - \epsilon) + (1 - \epsilon)^2 \dots$ is true for any positive value of ϵ however small, but not for the value $\epsilon = 0$.

SERINGAPATAM, formerly the capital of Mysore, India, is situated on an island of the same name in the Káveri (Cauvery) river in $12^{\circ} 25' 33''$ N. lat. and $76^{\circ} 43' 8''$ E. long. It is chiefly noted for its fortress, which figured so prominently in Indian history at the close of the 18th century. This formidable stronghold of Tipu Sultan thrice sustained a siege from the British, but it was finally stormed in 1799; and after its capture the island was ceded to the British. The island of Seringapatam is about 3 miles in length from east to west and 1 in breadth, and yields valuable crops of rice and sugar-cane. The fort occupies the western side of the island, immediately overhanging the river. Seringapatam is said to have been founded in 1454 by a descendant of one of the local officers appointed by Rámánuja, the Vishnuité apostle, who named it the city of Sri Ranga or Vishnu. At the eastern or lower end of the island is the Lal Bagh or "red garden," containing the mausoleum built by Tipu Sultan for his father Hyder Ali, in which Tipu himself also lies. In 1881 the population of the town of Seringapatam was 11,734 (males 5579, females 6155).

SERJEANT-AT-LAW is the name given to one who holds an ancient and honourable rank at the English or Irish bar. The word is a corruption of *serviens ad legem*, as distinguished from *apprenticius ad legem*, or utter barrister, who probably originally obtained his knowledge of law by serving a kind of apprenticeship to a serjeant. When the order of serjeants was instituted is unknown, but it certainly dates from a very remote period. The authority of serjeant counters or countors (*i.e.*, pleaders, those who frame counts in pleading) is treated in the *Mirror of Justices*, and they are named in 3 Edw. I. c. 29. They may possibly have been the representatives of the *conteurs* mentioned in the great customary of Normandy. The position of the serjeant had become assured when Chaucer wrote. One of the characters in the *Canterbury Tales* is

"A serjeant of the law, wary and wise,
That often had y-been at the parvis."¹

Serjeants (except king's serjeants) were created by writ of summons under the great seal, and wore a special and distinctive dress, the chief feature of which was the coif, a white lawn or silk skull-cap, now represented by a round piece of black silk at the top of the wig. They enjoyed a social precedence after knights bachelors and before companions of the Bath and other orders. In this they differed from queen's counsel, who have simply professional as distinguished from social rank. Socially the serjeant had precedence, professionally the queen's counsel, unless indeed, as was often the case, a patent of precedence was granted to the former. Till past the middle of the 19th century, a limited number of the serjeants were called "king's (queen's) serjeants." They were appointed by patent and summoned to parliament. Until 1814 the two senior king's serjeants had precedence of even the attorney-general and solicitor-general. It was the custom for serjeants on their appointment to give gold rings with mottoes to their colleagues. Down to 1845 the order enjoyed a very valuable monopoly of practice. The serjeants had the right of exclusive audience as leading counsel in the Court of Common Pleas. In 1834 a royal mandate of William IV. attempted to abolish this privilege, but in 1840 the judicial committee of the privy council declared the mandate informal and invalid. The monopoly was finally abolished in 1845 by Act of Parliament (9 and 10 Vict. c. 54). For at least 600 years the judges of the superior courts of common law were always serjeants. If a judge was appointed who was not a serjeant at the time of his appointment, he was formally created one immediately before his elevation to the bench. By the Judicature Act, 1873, sect. 8, no person appointed a judge of the High Court of Justice or the Court of Appeal is required to take or have taken the degree of serjeant-at-law. The serjeants had their own inn of court down to a very recent date. Serjeants' Inn was formerly in two divisions, one in Fleet Street and one in Chancery Lane. In 1758 the members of the former joined the latter. In 1877 the latter was dissolved, the inn sold to one of the members, and the proceeds divided among the existing serjeants. The extinction of the order is now only a question of time, no serjeant having been created since 1868. It is, however, still within the discretion of the crown to create fresh serjeants if ever it should be deemed advisable to do so. In Ireland the order still exists. The three serjeants at the Irish bar have precedence next after the law officers of the crown.

See *Serviens ad Legem*, by Mr Serjeant Manning; *The Order of the Coif*, by Mr. Serjeant Pulling.

SERJEANTY, a form of tenure. See REAL ESTATE.

SERPENT, a musical instrument. See OPHICLEIDE, vol. xvii. p. 778.

SERPENTINE, a compact crypto-crystalline or fibrous mineral substance, occurring in rock-masses which commonly present dark green colours, variously mottled and fancifully compared to the markings on certain serpents, whence the name "serpentine." For a like reason it is sometimes called "ophite," while Italian sculptors have termed it "ranocchia," in allusion to its resemblance to the skin of a frog. In consequence of its variegated tints, the stone is frequently cut and polished for ornamental purposes, and is hence popularly called a marble. From true marble, however, it differs in chemical composition, being essentially a hydrated silicate of magnesium, usually associated with certain metallic oxides (such as those of iron, nickel, and chromium) which confer upon the stone its characteristic tints. In some localities serpentine is found in

¹ The parvis was the porch of old St Paul's, where each serjeant had his particular pillar at which he held interviews with his clients.

masses which are evidently intrusive among other rocks, while elsewhere it occurs interbedded, usually in lenticular masses, associated with gneiss and crystalline schists. It is noteworthy that the serpentine is frequently crushed and brecciated, exhibiting polished slip-faces which are sometimes striated. The surface of an exposed mass of serpentine is generally barren, whence bosses of the rock are known in the Alps as "monts morts." The origin of serpentine has been a subject of much dispute. It was pointed out by Sandberger and Tschermak that the alteration of olivine may give rise to this product, and pseudomorphs of serpentine after chrysolite are well known to mineralogists. Professor Bonney and many other geologists regard serpentine as being generally an altered eruptive rock, due to the hydration of peridotites, such as lherzolite; probably it may also result from the decomposition of olivine-gabbro and other rocks rich in magnesian silicates. Augite and hornblende may become altered to serpentine. On the contrary, Dr Sterry Hunt and certain other chemical geologists believe that serpentine has generally been formed as an aqueous sediment, probably precipitated by the reaction of sulphate or chloride of magnesium upon the silicate of lime or alkaline silicates derived from the disintegration of crystalline rocks and found in solution in many natural waters. Serpentine is a rock of rather limited occurrence. Its principal localities in England are Cornwall, especially in the Lizard district, where it occupies a considerable area. The famous scenery of Kynance Cove owes much of its beauty to the vivid colours and brilliant surface of the serpentine. The rock is worked into vases, columns, mantelpieces, &c., and of late years has been used to a limited extent for the decoration of shop-fronts in London. The beauty of the Lizard rock is heightened by the white veins of steatite which traverse it, and in some cases by disseminated crystals of bastite, which glisten with metallic lustre. Much of the Lizard serpentine is of rich red and brown colour. Green serpentine is found near Holyhead in Anglesea. A singularly beautiful variety of mottled red and green tints, with veins of steatite, occurs near Portsoy in Banffshire, Scotland. It is also found with chrome iron ore in the Shetland Islands. The green serpentine of Galway occurs in intimate association with crystalline limestone, forming the rock known as "ophicalcite" or "serpentine marble." Such an association is by no means uncommon; but, though the beauty of the serpentine may thus be enhanced, its durability seems to be impaired. On exposure to the weather the carbonate of calcium decomposes more readily than the silicate of magnesium, and hence the stone soon presents a rough eroded surface. The Galway rock comes into the market under the name of "Irish green" or "Connemara marble." Ophicalcites also occur in Ayrshire, Scotland, and in various parts of the Scottish Highlands; and the green pebbles found in Iona belong to this type of rock.

On the Continent serpentines are largely worked at Zöblitz and at Waldheim in Saxony. The famous rock of Zöblitz, mentioned by Agricola, is known to have been wrought for between three and four centuries, and is still extensively explored by open quarries and by subterranean galleries. The rock usually presents various shades of green and brown, red being very rare; but its most interesting feature is the frequent presence of pyrope, or Bohemian garnet, which occurs scattered through the rock in dark red grains, that decompose on weathering to a green chloritic product. Very little of the Zöblitz serpentine comes to England, but it is common throughout Germany, and a good deal is sent to Russia and even to the United States. It has been used in the construction of the mausoleum of Prince Albert at Frogmore, and for Abraham Lincoln's monument at Springfield, Illinois. The best known

of the Italian serpentines is the "verde Prato," which has been quarried for centuries at Monteferrato, near Prato in Tuscany. According to Capacci this serpentine is probably of Eocene age. It has been largely used as a decorative stone in ecclesiastical architecture in Prato, Pistoia, and Florence. A good deal of serpentine is found near Genoa and Levanto. The "verde di Pegli" is obtained from Pegli, not far from Genoa, while the "verde di Genova" is a brecciated serpentinous limestone from Pietra Lavezzara. Serpentine also occurs at various other points of the Apennines, in Elba, and in Corsica. The term "ophiolite" has been vaguely used to include not only serpentines but many of the rocks associated with the Italian serpentines. In like manner the term "gabbro," derived from a locality near Leghorn, was at one time used as a general name for serpentine and its associates, though now usually restricted to a rock composed essentially of plagioclase and diolite. It is notable that this true gabbro is often found in company with serpentine.

Serpentine is found in numerous localities in the Alps and in France. An elegant variety is quarried at Épinal in the Vosges, and a beautiful ophicalcite is worked at St Vêran and Maurins, in the department of Hautes-Alpes. The serpentine of the Ronda Mountains in Spain has been described by Mr J. Macpherson. In North America serpentine is so extensively distributed that only a few localities can be mentioned. It is found at Syracuse in New York; on Manhattan and Staten Islands; at Hoboken in New Jersey; at Newport, Rhode Island; at Newburyport, Massachusetts; at Westchester, Chester county, and at Texas, Lancaster county, in Pennsylvania. It also occurs between Clear Lake and New Idria in California. A fine ophicalcite has been obtained from near Milford and New Haven in Connecticut, and a beautiful variety has been worked at Port Henry, Essex county, New York (Dana). The Canadian eozone occurs in a serpentinous limestone.

See GEOLOGY, vol. x. pp. 228, 232; MARBLE, vol. xv. p. 528; and MINERALOGY, vol. xvi. p. 414. The literature of the Italian and Saxon serpentines is rather voluminous. Of recent English writings on serpentine reference may be made to Bonney, in *Quart. Journ. Geol. Soc.*, London, xxxiii. p. 884, xxxiv. p. 769, xxxvii. p. 40, xxxix. p. 21, and in *Geol. Mag.*, [2] vi. p. 362, [3] i. p. 406; and to Collins, *Quart. Journ. Geol. Soc.*, xl. p. 453, and *Geol. Mag.*, [3] ii. p. 298. Sterry Hunt has written an elaborate paper in *Proc. Roy. Soc. Canada*, 1883, sect. iv. pp. 165-215. See also Teall, *British Petrography*, 1886, and Becker, in *Amer. Journ. of Science*, May 1886. (F. W. R.*)

SERPENTS. See SNAKES.

SERPUKHOF, a district town of Russia, in the government of Moscow, 61 miles south of the city of Moscow, with which it is connected by rail. Built on high cliffs on both banks of the river Nara, 3 miles above its junction with the Oka, Serpukhoff has of late become an important manufacturing and commercial town. The aggregate production of its manufactories (cotton and woollen stuffs, paper, leather), which employ about 4000 hands, in 1880 was valued at about £300,000. The surrounding district has several large cotton and woollen factories, with a yearly output worth about £1,000,000. Petty trades are also much developed in the neighbourhood,—textile fabrics, furniture, and earthenware and porcelain being produced by the peasantry. The manufactured goods of Serpukhoff are sent—mostly by rail—to the fairs of Nijni-Novgorod and the Ukraine, while large amounts of grain, hemp, and timber, brought from the east on the Oka, are discharged at Serpukhoff and sent on to Moscow and St Petersburg. The goods traffic by rail and river showed in 1880 an aggregate of 5,400,000 cwts. (exclusive of timber floated down the Oka). Notwithstanding its recent prosperity and the sums bequeathed to the municipality by wealthy merchants, Serpukhoff improves but slowly. The cathedral (1380) was rebuilt in the 18th century; of

the old fortress, situated on a promontory formed by a bend of the Nara, a few heaps of stones are the only remains. The population in 1884 was 22,420.

Serpukhoff is one of the oldest towns of the principality of Moscow; it is mentioned in the will of Ivan Daïslovich (1328), at which time it was a nearly independent principality under the protectorate of Moscow. Its fortress, protecting Moscow on the south, was often attacked by the Tatars; Toktamish plundered it in 1382, and the Lithuanian prince Svidrigaito in 1410. In 1556 the town was strongly fortified, so that fifteen years later it was able to resist the Mongol invasion. Its commercial importance dates from the 18th century.

SERTORIUS, QUINTUS. The life and career of the Roman Sertorius, a man of remarkable genius both as a general and as a statesman, may be said to be comprised between the years 105 and 72 B.C., a period of civil war and revolution in the Roman world, when every man of any mark had to be an adherent either of Sulla or of Marius. Sertorius, who came from a little Sabine village under the Apennines and was a self-made man, attached himself to the party of the latter, and served under him in 102 B.C. at the great battle of Aquæ Sextiæ (Aix), in which the Teutones were decisively defeated. Three years before he had witnessed the rout of a Roman army by the Cimbri on the Rhone. In 97 he was serving in Spain and thus had a good opportunity of making himself acquainted with the country with which his fame is chiefly associated. In 91 he was quæstor in Cisalpine Gaul, and on his return to Rome he met with such a hearty welcome that he would have been elected to the tribuneship but for the decided opposition of Sulla. He now declared himself for Marius and the democratic party, though of Marius himself as a man he had the worst opinion. He must have been a consenting party to those hideous massacres of Marius and Cinna in 87, though he seems to have done what he could to mitigate their horrors by putting a stop to the outrages perpetrated by the scum of Marius's soldiery. On Sulla's return from the East and the war with Mithradates in 83, Sertorius left Rome for Spain, where he represented the Marian or democratic party, but, it would appear, without receiving any definite commission or appointment. Here he passed the remainder of his life, with the exception of some cruises in the Mediterranean in conjunction with Cilician pirates, and of a campaign in Mauretania, in which he defeated one of Sulla's generals and captured Tingis (Tangier). This success recommended him to the Spaniards, more particularly to the Lusitanian tribes in the west, whom Roman generals and governors of Sulla's party had plundered and oppressed. Brave and kindly and gifted with a rough telling eloquence, Sertorius was just the man to impress Spaniards favourably, and the native militia, which he organized, spoke of him as the "new Hannibal." Many Roman refugees and deserters joined him, and with these and his Spanish volunteers he completely defeated one of Sulla's generals and drove Metellus, who had been specially sent against him from Rome, out of Lusitania, or Further Spain as the Romans called it. Sertorius owed much of his success to his statesmanlike ability, and it seems that he aspired to be in Spain what the great Agricola afterwards was in Britain. His object was to build up a stable government in the country with the consent and co-operation of the people, whom he wished to civilize after the Latin model. He established a senate of 300 members, drawn from Roman emigrants, with probably a sprinkling of the best Spaniards. For the children of the chief native families he provided a school at Osca (Huesca), where they received a Roman education and even adopted the dress of Roman youths. Strict and severe as he was with his soldiers, he was particularly considerate to the people generally and made their burdens as light as possible. It seems clear that he had a peculiar gift for evoking the

enthusiasm of rude tribes, and we can well understand how the famous white fawn, which was his constant companion, may have promoted his popularity. For six years he may be said to have really ruled Spain. In 77 he was joined by Perpenna, one of the officers of Lepidus, from Rome, with a following of Roman nobles, and in the same year the great Pompey, then quite a young man and merely a knight, was sent by the senate to take the command in Spain and with Metellus to crush Sertorius. The war was waged with varying success, but on the whole Sertorius proved himself more than a match for his adversaries, utterly defeating their united forces on one occasion near Saguntum. Pompey wrote to Rome for reinforcements, without which, he said, he and Metellus would be driven out of Spain. Rome's position was very critical, the more so as Sertorius was in league with the pirates in the Mediterranean, was negotiating with the formidable Mithradates, and was in communication with the insurgent slaves in Italy. But owing to jealousies among the Roman officers who served under him and the Spaniards of higher rank he could not maintain his position, and his influence over the native tribes slipped away from him, though he won victories to the last. In 72 he was assassinated at a banquet, Perpenna, it seems, being the chief instigator of the deed.

What we know of Sertorius is mainly drawn from Plutarch's *Lives*, from Appian, and from the fragments of Sallust. There is a good life of him by G. Long in Smith's *Class. Dict.*

SERVANT. See MASTER AND SERVANT.

SERVETUS, MICHAEL, or MIGUEL SERVETO (1511-1553), physician and polemic, was born in 1511¹ at Tudela in Navarre (according to his Vienne deposition), his father being Hernando Villanueva, a notary of good family in Aragon. His surname is given by himself as Serveto in his earliest works, "per Michaellem Serueto, alias Reues." Later he Latinized it into Servetus, and even when writing in French (1553) he signs "Michel Seruetus."² It is not certain that he was related to his contemporary André Serveto de Aniñon, the Bologna jurist; but it is probable that he was of the same family as the Spanish ecclesiastic Marco Antonio Serveto de Reves (d. 1598), born at Villanueva de Sigena in the diocese of Huesca (*Latassa, Biblioteca Nueva*, 1798, i. 609). Servetus, who at Geneva makes "Villeneuve" his birthplace, fixes it in the adjoining diocese of Lerida, in which there are three villages named Vilanova. Having apparently had his early training at the university of Saragossa, he was sent by his father to study law at Toulouse, where he first became acquainted with the Bible (1528). From 1525 he had found a patron in Juan de Quintañia (d. 1534), a Franciscan promoted in 1530 to be confessor to Charles V. In the train of Quintañia he witnessed at Bologna the coronation of Charles in February 1530, visited Augsburg, and perhaps saw Luther at Coburg. The spectacle of the adoration of the pope at Bologna had strongly impressed his mind in an anti-papal direction. He left Quintañia, and, after visiting Lyons and Geneva, repaired to Eccolampadius at Basel, whence he pushed on to Bucer and Capito at Strasburg. A crude, but very original and earnest, theological essay, *De Trinitatis Erroribus*, printed at Hagenau in 1531, attracted considerable attention; Melancthon writes "Servetum multum lego." It was followed in 1532 by a revised presentation of its argument. We next find Servetus at Lyons, in 1535, as an editor of scientific works for the printing firm of Trechsel, under the name of Michel de Villeneuve or Michael Villanovanus, which he used without interruption till the year

¹ This date rests upon his own testimony as to his age (both at Vienne and Geneva) and that of Calvin. An isolated passage of his Geneva testimony may be adduced in support of 1509.

² The form "Servet" first appears in a letter of Eccolampadius to the senate of Basel (1531), and is never used by himself. "Servede" is an imaginary form.

of his death. Here he found a friend in Dr Symphorien Champier (Campegius) (1472-1539), whose profession he resolved to follow. Accordingly he went (1536) to Paris, where he studied medicine under Johann Günther, Jacques Dubois, and Jean Fernel. It was in 1536, when Calvin was on a hurried and final visit to France, that he first met Servetus at Paris, and, as he himself says, proposed to set him right in theological matters.¹ As assistant to Günther, Servetus succeeded the famous anatomist Vesalius; Günther, who pays the highest tribute to his general culture, describes him as specially skilled in dissection and "vix ulli secundus" in knowledge of Galen. He graduated in arts and asserts that he also graduated in medicine, published a set of lectures on syrups (the most popular of his works), lectured on geometry and astrology, and defended by counsel a suit brought against him (March 1538) by the medical faculty on the ground of his astrological lectures. In June 1538 we find him at the university of Louvain (where he was inscribed on the roll of students as Michael Villanova on 14th December 1537), studying theology and Hebrew, explaining to his father (then resident at San Gil) his removal from Paris, early in September 1537, as a consequence of the death (8th August) of his master (el señor mi maestro), and proposing to return to Paris as soon as peace was proclaimed. After this he practised medicine for a short time at Avignon, and for a longer period at Charlieu (where he contemplated marriage, but was deterred by a physical impediment). In September 1540 he entered himself for further study in the medical school at Montpellier. In 1541 he resumed editorial work for the Lyons booksellers, to whose neighbourhood he had returned.

Among the attendants upon his Paris lectures had been a distinguished ecclesiastic, Pierre Paulmier, since 1528 archbishop of Vienne. Paulmier invited Servetus to Vienne as his confidential physician. He acted in this capacity for twelve years (1541-53), and made money. Outwardly he conformed to Roman Catholic worship; in private he pursued his theological speculations. It is probable that in 1541 he had been rebaptized. He opened a correspondence with Calvin, and late in 1545, or very early in 1546, he forwarded to Calvin the manuscript of a revised and enlarged edition of his theological tracts, and expressed a wish to visit him at Geneva. Calvin replied on 23d February 1546, in a letter which is lost, but in which, he says, he expressed himself "plus durement que ma coustume ne porte." On the same day he wrote to Guillaume Farel, "si venerit, modo valeat mea autoritas, vivum exire nunquam patiar," and to Pierre Viret in the same terms. Servetus had fair warning that if he went to Geneva it was at his peril. In his letter to Abel Pouppin (in or about 1547), after stating that he had failed to recover his manuscript from Calvin, he says, "mihi ob eam rem moriendum esse certo scio." The volume of theological tracts, again recast, was declined by a Basel publisher in April 1552, but an edition of 1000 copies was secretly printed at Vienne. It was finished on 3d January 1553; the bulk of the impression was privately consigned to Lyons and Frankfurt, for the Easter market. But on 26th February a letter, enclosing a sheet of the printed book, and revealing the secret of its authorship, was written from Geneva by Guillaume H. C. de Trye, formerly *échevin* of Lyons, to his cousin Antoine Arneys in that city. This letter bears no sign of dictation by Calvin; the history of De Trye shows that it may have been instigated in part by personal ill-feeling towards the Lyons booksellers. But Calvin furnished (reluctantly, according to De Trye) the samples of Servetus's handwriting enclosed in a subsequent letter, for the express purpose of securing his conviction.

The inquisitor-general at Lyons, Matthieu Ory, set to work on 12th March; Servetus was interrogated on 16th March and arrested on 4th April. Under examination his defence was that, in correspondence with Calvin, he had assumed the character of Servetus for purposes of discussion. At 4 A.M. on 7th April he escaped from his prison, evidently by connivance. He took the road for Spain, but turned back in fear of arrest. How he spent the next four months is not known; Calvin believed he was wandering in Italy; the idea that he lay concealed in Geneva was first started by Spon. On Saturday 12th August he rode into Louyset, a village on the French side of Geneva. Next morning he walked into Geneva, and ordered a boat, to take him towards Zurich on his way for Naples. He was recognized that day at church and immediately arrested. The process against him lasted from 14th August to 26th October, when sentence "estre bruslé tout vyfz" was passed, and carried out next day at Champel (27th October 1553). Calvin would have had him beheaded. Meanwhile the civil tribunal at Vienne had ordered (17th June) that he be fined and burned alive; the sentence of the ecclesiastical tribunal at Vienne was delayed till 23d December. Jacques Charmier, a priest in Servetus's confidence, was condemned to three years' imprisonment at Vienne. The life of Servetus is full of puzzles; his writings give the impression not only of quick genius but also of transparent sincerity; they throw, however, little light on the mysterious parts of his story. Don Pedro Gonzalez de Velasco (see his *Miguel Servet*, 1880) has placed a statue of Servetus in the porch of the Instituto Antropológico at Madrid.

The opinions of Servetus, marked by strong individuality, are not easily described in the terms of any current system. His anabaptism, with his denial of the tripersonality of the Godhead and of the eternity of the Son, made his views abhorrent to Catholics and Protestants alike; while his intense Biblicism, his passionate devotion to the person of Christ, and the essentially Christocentric character of his view of the universe give him an almost unique place in the history of religious thought. He is sometimes classed with the Arians; but he endorses in his own way the homoousian formula, and speaks contemptuously of Arius as "Christi gloriæ incapacissimus." He has had many critics, some apologists (e.g., Postel and Lincurius), and few followers. The fifteen condemnatory clauses, introducing the sentence of Servetus at Geneva, set forth in detail that he had been found guilty of heresies, expressed in blasphemous language, against the true foundation of the Christian religion. It is curious that one instance of his injurious language is his employment of the term "trinitaires" to denote "ceux qui croyent en la Trinite." No law, current in Geneva, has ever been adduced as enacting the capital sentence. Claude Rigot, the procureur-général, examined Servetus with a view to show that his legal education must have familiarized him with the provisions of the code of Justinian to this effect; but in 1535 all the old laws on the subject of religion had been set aside at Geneva; the only civil penalty for religion, retained by the edicts of 1543, was banishment. The Swiss churches, while agreeing to condemn Servetus, give no hint of capital punishment in their letters of advice. The extinct law seems to have been arbitrarily revived for the occasion. A valuable controversy followed, on the question of executing heretics, in which Beza (for), Mino Celsi (against), and several caustic anonymous writers took part.

The works of Servetus are not so rare as is often supposed, but the most common are his earliest, in which he approaches nearer to the position afterwards taken by F. Socinus than he does in his more matured publications. The following is an enumeration of them in the order of their appearance. (1) *De Trinitatis Erroribus Libri Septem*, 1531, 16mo. (2) *Dialogorum de Trinitate Libri Duo*, 1532, 16mo; four chapters are added on justification and kindred topics. These two books have been twice reprinted and manuscript copies are common; a Dutch version, by Reynier Telle, was published in 1620. (3) *Claudii Ptolomæi Alexandrini Geographicæ Enarrationis Libri Octo: ex Bilibaldi Pirckheymeri translatione, sed ad Græca et prisca exemplaria a Michaelæ Villanovano jam primum recogniti. Adjecta insuper ab eodem scholia, &c.*, Lyons, (Melchior & Caspar Trechsel), 1535, fol.; 2d ed., Lyons (Hugo à Porta), 1541, i.e., 1542; printed by Caspar Trechsel at Vienne, fol.; on this work Tollin founds his high estimate of Servetus as a comparative geographer; the passage incriminated on his trial as attacking the authority of Moses is an extract from Lorenz Friese.

¹ Beza incorrectly makes Servetus the challenger and the date 1534.

(4) *Brevissima Apologia pro Symphoriano Campegio in Leonardum Fuchsum*, 1536, 12mo; no extant copy is known; Tollin has reprinted an extract from it. (5) *Syruporum Universa Ratio*, &c., Paris, 1537, 16mo; there were four subsequent editions, the last being Venice, 1548 (six lectures on digestion, the composition and use of syrups being treated in the fifth lecture). (6) *In quendam Medicum Apologetica Disceptatio pro Astrologia*, Paris, 1538, 16mo; reprinted, Berlin, 1880; the medicus is Jean Tagault, who had interrupted the lectures of Servetus on astronomy, under which he included meteorology. (7) *Biblia Sacra ex Sanctis Pagnini Tralatione . . . recognita, et scholiis illustrata*, &c., Lyons (Hugo à Porta), 1542, fol., remarkable for its theory of prophecy, explained in the preface and illustrated in the notes. (8) D'Artigny says that Servetus "fit les argumens" to a Spanish version of the *Summa* of Aquinas; but nothing is known of this or of the "divers traités de grammaire" which he translated from Latin into Spanish. (9) *Christianismi Restitutio*, &c., 1553, 8vo (perfect copies in Vienna and Paris, an imperfect copy in Edinburgh), partly reprinted, London, 1723; 4to (copies in London and Paris), reprinted 1790; 8vo, by Rau at Nuremberg for De Murr, from the Vienna copy; manuscript copies are rare; the Paris library has a manuscript copy of an earlier recension of several books, including the often-quoted description of the pulmonary circulation. This work is often called anonymous, but the initials M. S. V. are given at the end and the full name at p. 199; the volume is not a single treatise but an assemblage of theological tracts written in a nervous and epigrammatic style and with great command of very various learning; the *Apologia* addressed to Melanchthon, with which it concludes, is in the writer's best manner. Two treatises, *Desiderius* (ante 1542) and *De Tribus Impostoribus* (1598), have been erroneously assigned to Servetus. Of his few remaining letters most will be found in Mosheim.

The literature relating to Servetus is very large, but the following are some of the most important pieces. Calvin's *Defensio Orthodoxæ Fidei*, &c., 1554, 4to (also in French, *Déclaration pour maintenir*, &c., 16mo, same date), is the source of many prevalent misconceptions respecting the opinions of Servetus and his attitude on his trial. De la Roche's *Historical Account*, &c., in *Mem. of Lit.*, 1711-12 (reproduced in French, *Biblioth. Angl.*, Amsterdam, 1717, 18mo), was followed by *An Impartial History*, &c., 1794, 8vo (said to be by Nathaniel Hodges, a Baptist minister, afterwards knighted). Allwoerden's *Historia*, &c., 1728, 4to (materials furnished by Mosheim), is superseded by Mosheim's *Anders. weitiger Versuch*, &c., 1748, 4to, with its appendix, *Neue Nachrichten*, 1750, 4to, issued after the publication of the records of the Vienne trial by D'Artigny, in *Nouveaux Mémoires d'Hist.*, &c., vol. ii., 1749, 12mo. Chaupepié's valuable article in *Nouv. Dict. Historique*, vol. iv., 1756, fol. (translated separately by Rev. James Yair, 1771, 8vo), makes no use of Mosheim's later researches. Trechsel, in *Die prot. Antitrinitarier vor F. Socin*, &c., bk. i., 1839, 8vo, uses all available materials up to date. Since then the investigations of H. Tollin (published in a series of some forty separate articles in various journals from 1874 to 1885) have thrown light on every portion of the subject. The records of the Geneva trial, first published by De la Roche, and reproduced in Rillet's *Relation*, &c., 1844, 8vo, and elsewhere, are best given in vol. viii. (1870) of the edition of Calvin's works by Baum, Cunitz, and Reuss; Roget, in *Hist. du Peuple de Genève*, vol. iv., 1877, has a good account of both trials. The passage describing the pulmonary circulation is first noticed by W. Wotton, in *Reflections upon Ancient and Mod. Learning*, 1694, and has given rise to a literature of its own;—see especially Tollin's *Die Entdeckung des Blutkreislaufs*, &c., 1876, Huxley, in *Fortnightly Rev.*, February 1878; and Tollin's *Kritische Bemerkungen über Harvey und seine Vorgänger*, 1882. Other physiological speculations of Servetus are noted by Sigmond (*The Unnoticed Theories of Servetus*, 1826); but it has escaped Sigmond that Servetus had an idea of the composition of water and of air. As a thinker, Servetus is claimed on superficial grounds by Unitarians (see Wallace, *Antitrin. Biog.*, 1850, i. 420), who have written several accounts of him, of which R. Wright's *Apology*, &c., 1807, 8vo, is the worst, and J. S. Porter's *Servetus and Calvin*, &c., 1854, 8vo, perhaps the best. Saisset, in *Rev. des Deux Mondes*, 1848, treats Servetus as a pantheist; he is followed by Willis, in his *Servetus and Calvin*, 1877, 8vo, a most unsatisfactory book (comp. *Theol. Rev.*, April and July 1878). Tollin's *Das Lehrsystem Michael Servet's*, 8 vols., 1876-78, 8vo, and Pünjer's compendious *De Michaelis Serveti Doctrina*, &c., 1876, 8vo, are valuable digests of his opinions, from different points of view. Of Servetus's personal character the best vindication is Tollin's *Charakterbild Michael Servet's*, 1876, 8vo (in French with additions by Dardier, *Portrait Caractère*, 1879, 8vo). His story has been dramatized by Max Ring, *Die Genfer* (1850), by José Echegaray, *La Muerte en los Labios* (1880), and by Albert Hamann, *Servet* (1881). The recent discovery at the Record Office, London, (U. 140) and the British Museum (Cotton MSS., Galba B. x.) of intercepted letters from Servetus at Louvain in 1538 adds considerably to our information about his family and early friends, but introduces new problems as to the details of his fiftful career. (A. GO.)

Plate I.

SERVIA, a kingdom belonging to the Balkan peninsula of Europe, lying between Bosnia on the west and Bulgaria and Roumania on the east, and between the Turkish province of Albania on the south and the Austrian Military Frontier on the north. From Bosnia it is separated by the Drina, from Austrian and Roumanian territory by the Danube and the Save, and from Bulgaria partly by the Timok. Some parts of the southern frontier are indicated by mountains, but elsewhere there are no natural boundaries. In shape Servia is an irregular trapezium, situated between about 42° 30' and 45° N. lat. and 19° and 22° 30' E. long. The area is about 18,760 square miles, and the population (1,667,159 in 1874) was estimated at the end of 1884 to be 1,902,419, thus giving a density of about

100 to the square mile. This low density, only about one-third of that of the United Kingdom, is explained by the nature of the surface, the inland position, the defective communications with the exterior, and the absence of manufacturing industries.

The surface is for the most part mountainous or hilly, Oro-though there are no well-defined mountain ranges of any graphy-extent. The highest summits lie near the middle of the southern frontier, where Mount Kopaonik attains the height of nearly 7000 feet. Towards the Bosnian frontier the mountains are pretty closely massed together, and some of the summits approach 4000 feet; this height is exceeded on the eastern side of the country, where the mountains, forming a continuation of the Carpathians, are in many places more rugged and precipitous than anywhere else in the kingdom. The Rudnik Mountains, which begin immediately to the north of the Servian Morava, have their highest parts in the south and gradually sink towards the north from nearly 3000 to less than 2000 feet. Still lower are the elevations in the provinces in the extreme south acquired in 1878 under the treaty of Berlin. As a general rule the Servian highlands consist of detached groups of mountains and conical hills with gentle slopes rising from verdant valleys, and they are mostly covered to the top with forests, chiefly of oak and beech, the higher summits in the south also with conifers. But the plains, though numerous, are of no great extent, and occur chiefly along the banks of the rivers. Apart from frontier rivers, the most important stream is the Morava, which, rising on the western slopes of the Kara Dag, a little beyond the Servian frontier, enters the country with a north-easterly course near the extreme south-east, and then turns north-north-west and flows almost in a straight line through the heart of the kingdom to the Danube. In the upper part of its course it is known as the Bulgarian Morava, and only after receiving the Servian Morava on the left is it known as the Morava simply or as the Great Morava. The only other important tributary is the Nishava, which it receives from the right at Nish. The valleys of all these rivers, especially those of the Bulgarian and the Great Morava, and of the Nishava, contain considerable areas of level or low-lying country well suited for the growth of corn, and the low grounds along the Save and the Danube from the Drina to the Morava are also well adapted for agriculture, though for the most part devoted only to pasture. Altogether no more than one-sixth of the surface is estimated to be occupied by cultivated fields and vineyards, while one-fifth is estimated to form pasture land and about an equal area woodland. Nearly one-half of the entire area is believed to be unproductive.

Besides the frontier streams on the north and west, the only river of any importance for navigation is the Morava, which is navigable for steamers of light draught as high as Tiupriia about 60 miles from its mouth, but its valley is important as the main highway of the country, and all the more since the introduction of railways. Railways Rail-both to Constantinople and to Salonica are now (1886) in ways-course of construction under a convention concluded with Austria in 1881. The section common to the two systems, that from Belgrade to Nish, 152 miles in length, was opened for traffic in September 1884, and the line (76 miles) from Nish to Vranja was completed in March 1886, but the connexion with the Turkish railway from Salonica remains to be completed. At present, in consequence of the unsatisfactory communication with the south, only about 7 or 8 per cent. of the Servian imports enter by the southern frontier, 85 per cent. coming through Austria-Hungary. In the beginning of 1886 work had been begun on only one-half of the line from Nish to Pirot, on the other system.

Geology. The geological structure of Serbia is varied. In the south and west the sedimentary rocks most largely developed are of ancient, pre-Carboniferous date, interrupted by considerable patches of granite, serpentine, and other crystalline rocks. Beyond this belt there appear in the north-west Mesozoic limestones, such as occupy so extensive an area in the north-west of the Balkan peninsula generally, and the valleys opening in that quarter to the Drina have the same desolate aspect as belongs to these rocks in the rest of that region. In the extreme north-east the crystalline schists of the Carpathians extend to the south side of the Danube, and stretch parallel to the Morava in a band along its right bank. Elsewhere east of the Morava the prevailing rocks belong to the Cretaceous series, which enters Serbia from Bulgaria. The heart of the country—the Shumadia, as it is called—is mainly occupied by rocks of Tertiary age, with intervening patches of older strata; and the Rudnik Mountains are traversed by metalliferous veins of syenite. The

Minerals. mineral wealth of Serbia is considerable and varied, though far from being adequately developed. Gold, silver, iron, and lead are said to have been worked in the time of the Romans. Heaps of ancient slag from lead mines still exist in the neighbourhood of Belgrade, and other old lead mines occur in the valley of the Toplitza. Gold dust is washed down by heavy rains in the valley of the Timok, where it is gathered by the peasants. In the syenite veins of the Rudnik Mountains ores of lead, zinc, copper, sulphur, and arsenic are present, but are not worked, and from the mines of Krupani in the north-west argentiferous lead, antimony, and other ores have been obtained. The principal mining centre east of the Morava is Maidanpek in the north, where there is a large iron-smelting establishment in the hands of an English company. Coal or lignite is met with in many places, including a number of points on the Servian railway. The largest deposit lies round Tiupriia, and measures about 19 miles in length by $7\frac{1}{2}$ in breadth. All the minerals belong to the state, but permission to work them can be obtained on payment of a moderate royalty.

Climate. The climate of Serbia is on the whole mild, though subject to the extremes characteristic of inland Eastern countries. In summer the temperature may rise as high as 106° Fahr., while in winter it often sinks to 13° or even sometimes 20° below zero. The high-lying valleys in the south are colder than the rest of the country, not only on account of their greater elevation but also because of their being exposed to the cold winds from the north and north-east. Accordingly, the chief products of the soil are such as thrive under a warm summer and are unaffected by a cold winter. Both maize and wine are grown, but the olive is excluded by the severity of the cold season.

Products. Maize is the principal object of agriculture, the average annual crop being estimated at upwards of 5,000,000 bushels, wheat coming next with an average crop of less than 4,000,000 bushels. Besides cereals, flax, hemp, and tobacco, are grown, but the attempts made to cultivate cotton have proved unsuccessful. The chief wine-growing locality is in the north-east round Negotin. Inefficient as are the implements and backward the methods of agriculture, grain makes up a considerable portion of the exports, owing to the scantiness of the population and the deficiency of other industries, and it is expected that this export will be greatly increased on the completion of the railway system to the southern seaports. The grain chiefly exported is wheat,—maize supplying, as among all the Slavs of the Balkan peninsula, the chief food of the people. Hitherto live-stock has formed the largest item in the exports, sometimes amounting to over one-half. Among these pigs, which are fed in immense numbers on the mast of the forests, take the first place. Of late years their number has greatly declined, largely in consequence of American competition; but relatively to population Serbia still maintains a much greater number than any other country of Europe; and the same is true of sheep, which are here relatively more than twice as numerous

as in Spain. Cattle also are numerous, but are reared solely as beasts of draught and for export. Bees are very generally kept,—the honey being consumed in the country, the wax exported. The rearing of silkworms is spreading, especially since cocoons and eggs have begun to be exported to Italy. Orchards are very extensive, and all kinds of fruit belonging to central Europe are grown in abundance,—above all, the plum, from which is distilled the favourite national spirit, *slivovitz*. The average annual value of the exports is a little over £1 per head of population. After live animals and grain come hides and prunes. Among the imports the chief items are sugar, salt (wholly absent in Serbia), cotton goods, and other textiles. Import duties being high, a considerable amount must always be allowed for smuggled goods. Though the great bulk of the imports enter the country by the Austrian frontier, an increasingly large proportion comes originally from beyond Austria-Hungary. Thus in 1879, of the total quantity of imports across the Austrian frontier, 76 per cent. were of Austrian-Hungarian origin, in 1880 73 per cent., in 1881 65 per cent., leaving 24, 27, and 35 per cent. respectively for countries beyond. Among the latter Germany comes next after Austria-Hungary and then England. Colonial wares (sugar, coffee, &c.) are now imported cheaper by way of Hamburg than by way of Trieste.

The natural increase of population in Serbia is pretty rapid, the Popu-annual birth-rate being among the highest in Europe, while the lation. death-rate, though high, is exceeded in several other countries. During the years 1879-84 the average annual number of births was 76,962, of deaths 47,181, the excess of births over deaths 29,781, which figures compared with a total population intermediate between that at the end of 1874 and that at the end of 1884 give a birth-rate of upwards of 43 per thousand, a death-rate of less than 27 per thousand, and an annual excess of births over deaths of nearly 17 per thousand. The average proportion of male to female births is 106:100. The people are mainly Serbs, though the proportions have been modified by the increase of territory under the treaty of Berlin. This territory, at one time occupied by Servians, had been to a large extent deserted by them in consequence of the oppressive Turkish yoke, and their place had been taken by Mohammedan Albanians west of the Morava and by Bulgarians in the valley of the Nishava. Most of the Albanians, however, quitted their homes at the time of annexation, and Servians are now returning to their former seats. Previous to the treaty of Berlin the principal element of the population next after the Servians consisted of Roumanians, of whom there were about 130,000. The Servian Church forms a branch of the Oriental Greek Church with a perfectly independent administration. The highest ecclesiastical authority is exercised by the national synod. Elementary education is in a very backward state, but recently a law has been passed to remedy this defect, by making education obligatory on all children between six and thirteen and laying the duty of providing accommodation, books, and teachers upon school districts. At Belgrade there is a high school or university with faculties of philosophy, law, and technics.

The agricultural population are scattered among a great number of villages, most of which consist of single isolated homesteads. Each homestead is occupied by a group of families connected by blood and acknowledging one head, the *stareshtina*, who is usually the patriarch of the community, but is often chosen by the rest of the members on account of his prudence and ability. He regulates the work and distributes the proceeds of the labour of the entire homestead, and his ruling is followed without question. The land cultivated by a family or group of families is always their own property. The buildings belonging to the homesteads are enclosed within an immense palisade, inside which a large expanse of fields is mostly planted with plum, damson, and other fruit-trees, surrounding the houses of the occupiers. In the midst of these is the house of the *stareshtina*, which contains the common kitchen, eating hall, and family hall of the entire homestead. In this last all the members assemble in the evening for conversation and amusement, the women spinning, while the children play. The people take delight in listening to the recitation of the poetical rhapsodies in which the Servian literature is remarkably rich. The houses are mostly very small wooden structures, serving for little else but sleeping places. But that of the *stareshtina* is often of brick, and is invariably of better construction than the rest.

Since 6th March 1882 the government has been a constitutional Govern-monarchy. The legislative body is called the *skupshchina*, and in ment. 1884 consisted of 178 members, three-fourths of whom are elected by the people, the remainder being nominated by the king. A new *skupshchina* is elected every three years. For the settlement of special questions of great moment an extraordinary *skupshchina* or great national assembly is elected, in which there are four times as many members, all elected, as in the ordinary *skupshchina*. There is also a permanent council of state of 15 members, who have the task of drawing up proposals for legislation, hearing complaints regarding the decisions of ministers, and performing other functions. For administrative purposes the kingdom is divided into twenty-two circles, besides the city of Belgrade. In the budget for 1883-84 the revenue and expenditure were each estimated at nearly

**Exports
and
imports.**

£1,500,000, and for 1884-85 at about £1,840,000. The national debt at the end of 1884 was about £7,000,000. An additional debt of about £1,000,000 was contracted during the Servo-Bulgarian war of 1885-86.

Army.

The Serbian army is divided into three classes. The first class, embracing men between 25 and 30 years of age, constitutes the standing army, which numbers 18,000 on a peace footing and about 100,000 on a war footing. The first two years are served with the colours and the remainder of the term in the reserve. The second class contains men between 30 and 37 who have served in the standing army. The third class, which is only called out in extraordinary emergencies, is composed of men between 37 and 50. The total military strength of Serbia for cases of emergency is estimated to be about 210,000 men.

The capital of Serbia is Belgrade, at the junction of the Danube and the Sava. It is the only town with more than 15,000 inhabitants. Next in size is Nish, in the territory added by the treaty of Berlin, where the valley of the Nishava opens into that of the Bulgarian Morava. The other chief towns are Kragushevat in the centre of the Shumadia, the former capital of the country, Shabatz on the Save, Semendria on the Danube, Krushevat, Alexinatz (the centre of the flax and hemp growing district), Ushitze, Posharevat, Vranja, and Leskovatz.

See Rev. W. Denton, *Serbia and the Servians*, London, 1862; Kanitz, *Serbien: historische-ethnographische Reise Studien*, Leipzig, 1868; Balme, *La Principauté de Serbie*, Paris, 1860. (G. G. C.)

HISTORY.

The original home of the Croats and Serbs, who are identical in race and language, was the country adjoining the Carpathian range. Their speech shows them to belong to the eastern division of the Slavonic family (see SLAVS). The generally accepted derivation of the name *Chrobat*, *Croat*, is from the original designation of the Carpathians, *Chrbet*, "a ridge," an opinion supported by Schafarik and Professor Ljubic, author of a Croatian history. This view is rejected by Perwolf¹ and also by Penka,² but apparently on insufficient grounds. The last-named connects the word with the same root as that from which "Slav" is derived (*slu-ti*, *klui*, *keru*) and makes it signify the "vassals," those who follow a chief. The derivation suggested by Schafarik for "Serb" is the root *su*, "to produce"; thus the name would come to mean the people, just as *deutsch* is from *diot*, "people." He considers it to have been the original appellation of all the Slavs. This must be accepted as the best explanation hitherto given, though not altogether satisfactory. We find the name *Σέρβοι* in Ptolemy and *Sirbi* in Pliny.

Settlement of Serbs in Balkan peninsula.

The Serbs and Croats have no history till the year 638 A.D., at which period they left their original settlements and migrated into the ancient Illyricum and part of Moesia. Whether any of this people had previously taken up their abode in the Balkan peninsula is by no means clear, and very different opinions have been held on the subject. The most probable account is that small Slavonic colonies were settled here and there as early as the 2d and 3d centuries, consisting mainly of prisoners taken in war; and we hear of two tribes, the Karpi and the Kostoboki, who are claimed by Schafarik with good reason as Slavs. Jireček considers that for two hundred years before the Slavs are heard of in history south of the Danube they were scattered as colonists in Moesia, Thrace, Dardania, and Macedonia. Professor Drinoff finds mention of Slavonic colonies in Thrace in the *Itinerarium Hierosolymitanum* and *Itinerarium Antonini*; and, even if we do not give a complete adhesion to his views, there are many names of towns in Procopius (in the first half of the 6th century) which are undoubtedly Slavonic. The traces of the original inhabitants have disappeared, except in so far as the Albanians represent these peoples. It is generally believed that the word *meropch* or *neropch*, signifying a slave, found in the *Zakonik* of Dushan, refers to the Noropians, an old Thracian tribe.

Our authority for the Serbian migration in the middle of the 7th century is the emperor Constantine Porphyrogenitus. According to the story, five Croatian princes, the brothers Clocas, Lobelus, Cosentzis, Muchlo, and Chrobatus, and two sisters, Tuga and Buga (i.e., Calamity and Prosperity), came at this period from northern or Belo-Chrobatia, as it was called, the original home of the Croats in the Carpathian Mountains. The descendants of their people who remained in the territory are lost among the surrounding population. The services of these Croats were made use of by the emperor Heraclius, and they became a barrier against the Avars, whom they drove out of the country in which they settled. The territory which they occupied was divided by them into eleven *župas* or *gauen*. The people who inhabited the western portion kept the name of Croat, those in the eastern were called Serbs. We must now leave the Croats, as in this article we have only to do with the Serbs properly so called. The Croatian branch of the family, after being ruled by petty *bans* (a word said to be of Avar origin), was annexed to the kingdom of Hungary, and after the 16th century followed the fortunes of the house of Hapsburg.

For five centuries after their arrival in their new territories we hear nothing of the Serbs save an occasional very brief mention in contests the Byzantine chroniclers. The native annalists do not begin earlier with than the 12th century. As in Croatia so among the Serbs, the Greeks.

smaller *župas*³ gradually became merged into two or three great ones. The head *župan* of Serbia, who resided in Desnica, called by Constantine Destinica, was at first the suzerain of all the other Serbian *župas*, with the exception of the Pagani, concerning whose Latin name the emperor Constantine makes the very strange remark—*καὶ γὰρ Παγανοὶ κατὰ τὴν τῶν Σκλάβων γλῶσσαν ἀβάπτιστοι ἐμυνοῦνται*. After the land was harried by the Bulgarians we find the great *župan* of Dioclea (Doclea) supreme; he acquired the title of king, and received his insignia from the pope. Finally, Nemanya, the descendant of a *župan* family of Dioclea, founded a new dynasty in Rasa (mod. Novibazar), and united Serbia and Bosnia into one strong empire. The names of the earlier princes, who are insignificant and do not help us to follow the thread of Serbian history, need not be mentioned. We find them sometimes tributary to the Greek emperors and sometimes independent. They appear, moreover, to have been engaged in constant wars with the Bulgarians. About 1015 Vladimir was reigning; but he was assassinated by the Bulgarian czar John, who got possession of Serbia, but died two years afterwards on an expedition against the Greeks. Together with Bulgaria, Serbia fell under the power of the emperor, and its affairs were managed by a Greek governor. Stephen Voyislaff made an insurrection in 1040, expelled the governor, Theophilus Erotikus, and defeated the Greeks in 1043. His son and successor, Michael (1050-80), at first lived in peace with the Byzantines, but afterwards entered into diplomatic relations with the West, took the title of king (*rex*), and received his insignia from the pope (1078). He conquered Durazzo (Drac) in 1079, and reigned thirty years. His son, Constantine Bodin, subjugated the *župas* of Bosnia and Rasa. About 1122 Ourosh, surnamed Bela, *župan* of Rasa, ascended the throne. From this time dates the power of Serbia. His wife Anna was a German princess. Omitting three insignificant rulers, we come to the famous Stephen Nemanya (1159-95), whose life has been written by his son Sava. He reigned thirty-six years, and was many times successful against the Greeks, but was not able to take Ragusa. He abandoned the government to his son Stephen in 1195 and became a monk under the name of Simeon, dying in 1200 in the monastery of Chilandar on Mount Athos. Stephen was crowned by his youngest brother Sava, first archbishop of the country, with a crown which had been consecrated by the pope; hence his title *Provoynenchani*, "the first-crowned"—that is to say of the new dynasty, for the *župas* of Dioclea were already kings. He died in 1224 and was followed by his sons Radoslaff and Vladislaff in succession. The latter made an offensive and defensive alliance with Ragusa. He employed Germans to work the Serbian mines; and we find them repeatedly mentioned in Serbian documents under the name of Saxons, especially in the *Zakonik* of Stephen Dushan. No traces, however, can be found of them at the present day. Vladislaff's court is said to have been very luxurious. He died childless about 1237 and was succeeded by his brother Stephen Urosh, whose territories were devastated in 1241 by the Mongols. He was afterwards driven from his throne by his son Dragutin and died in 1272. The latter, however, stung by conscience, abandoned the crown to his brother Milutin and contented himself with Syrmia, where he died in 1317. The reign of Milutin was chiefly occupied with struggles against the Greeks; he was generally successful in his campaigns. But his domestic life was unhappy: he divorced three wives and caused his only son Stephen to be blinded from suspicion of his treachery. The operation, however, was imperfectly performed, and the youth recovered his sight. In 1314 Milutin fought on the side of the emperor Andronicus against the Turks, and in the same year forced the Ragusans to pay him tribute. After his brother Dragutin's death he seized his hereditary dominions, and recalling his son Stephen, whom he had banished to Constantinople, gave him Dioclea. In 1319 the Hungarians deprived him of Bosnia; two years later he died. His son Stephen was engaged in perpetual wars. In 1330 he defeated the Bulgarians at the brook Kamencha near Velbuzhd, when the Bulgarian czar Michael was slain. It was on this occasion that his son called Stephen Dushan first Stephen distinguished himself. In spite of the king's successes against the Greeks, he was destined to close his reign in the most lamentable manner: he was imprisoned and strangled by order of his own son at Zvechan in 1336. It is from this crime that Dushan gained his surname (*dushiti*, "to suffocate"). Concerning this prince, we are told by the ancient chroniclers that he was gigantic in stature and terrible in appearance. He conducted thirteen campaigns against the Greeks. In 1337 he took Strumitza and subjugated all Macedonia and Albania to Thessalonica, Kostur, and Janina, threatened Byzantium, and concluded a peace with the emperor Andronicus,

³ The following rules for the pronunciation of the Croatian letters will be found useful:—*c*=*ts*; *č*=*a* sound between *ts* and *ch*, something like *tie* in the English word "daintier"; *đ*=*ch* as in "church"; *j*=*y* as in "young"; *š*=*sh*; *ž*=*zh* or *j* in the French "jour."

who was shut up in Thessalonica. He now divided his kingdom into eight districts and arranged everything on the Byzantine model. He conquered the whole of Macedonia, and caused himself to be crowned emperor of Servia, his son Urosh as king (*kral, rex*), and the archbishop of the country as patriarch. In 1349, at a diet, he published his celebrated *Zakonik* or "Book of Laws" (see below). In 1356 he began a new campaign against the Greeks, his object being to seize Constantinople, to place the Greek crown upon his head, and drive the Turks out of Europe; but in the midst of his schemes he died at Deabolis in Albania on 18th December 1356. His son Urosh was then but nineteen years of age, and, being sickly in body and weak in mind, he was unable to struggle against the revolted governors of his provinces, some of whom wished to make themselves independent. He was killed in a conflict with one of them in 1367, who ascended the throne under the name of Vukashin. This monarch was at first successful against the Turks, now already masters of considerable portions of the Byzantine empire; but he lost the decisive battle of Tanarus, and with it his life, in 1371. According to the chroniclers, the Serbs were surprised and many slain while sleeping. Many also were drowned in the waters of the Maritza, "and there their bones lay and were never buried." The fate of Vukashin and of his brother Goiko was uncertain. The empire of Dushan now began to fall to pieces and Servia was again without a ruler. Marco, the son of Vukashin, declared himself the successor of his father; but the line was unpopular with the Serbs, and at a diet at Peć (Ipek) in 1374 they elected a young noble, Lazar Grebljanovich, a connexion of the old princely house. He did not, however, take the title of either emperor or king, but only of *knez* or prince. Bosnia was separated from Servia and fell under the rule of a noble named Tvertko. Sultan Murad had already conquered the Bulgarian sovereign Shishman and now marched against Servia. On the 15th of June 1389 the Serbs were completely defeated at the battle of Kosovo, the "field of black-birds." No event has been so much celebrated in the national songs as this. Many are the lays which tell of the treachery of Vuk Brankovich and the glorious self-immolation of Milosh Obilich, who stabbed the conqueror on the battlefield. The silken shroud, embroidered with gold, with which his wife Militza covered the body of her husband is still preserved in the monastery of Vrdnik in Symria, and a tree which she planted is shown to travellers at Župa. According to one account Lazar was killed in the battle; according to others he was taken prisoner and executed before the eyes of the dying Murad. The bones of Lazar now rest at Ravanitza on the Frushka Gora in Symria. We hear no more of independent Serb princes; the country was now tributary to Turkey, and its rulers were styled despots. Stephen, the son of Lazar, was confirmed in this title by Bajazid, the successor of Murad. Militza died in a convent in 1406. Stephen died in 1427 childless, and was succeeded by George Brankovich, a man sixty years of age, whose reign was a troubled one. In 1437 he was compelled to fly to Hungary to avoid the wrath of Murad II., and did not recover his territory till Hunyadi and Scanderbeg drove back the Turks in 1444. George fell, in the ninety-first year of his age, in battle with a Hungarian magnate named Michael Szilagyi on 24th December 1457. His youngest son Lazar succeeded him after committing many crimes, but only survived his father five weeks. His widow, Helena Paleologus, gave the country to the pope in order to secure his assistance against the Turks. Upon this the sultan ravaged Servia in the most pitiless manner, burnt the churches and monasteries, and carried off 200,000 persons into captivity. Servia became in all respects a Turkish province, although we occasionally find the empty title of "despot" borne by some of the descendants of its princes. Great numbers of the Serbs subsequently migrated to Hungary. In 1689 some thousands under the command of the despot George Brankovich entered the imperial (German) army. In 1691 the Servian patriarch, Arsenius Chernoyevich, led about 36,000 families to settle in various parts of Hungary, chiefly in Symria and Slavonia. These *zadrugas*, as they are called, are not families in our sense of the word, consisting of parents and children, but communities of families according to the custom still found among the Croats of the Military Frontier. The number of the emigrants at that time would probably amount to 400,000 or 500,000 persons. Others followed them in 1738 and 1738. These Serbs have kept their religion and language in spite of the desperate efforts of the Government to Magyarize them. The last despot of Servia was George Brankovich, who died in captivity in Austria in 1711.

In consequence of the splendid victories of Prince Eugene, Austria acquired the greater part of Servia by the treaty of Posharevatz in 1718, but the Turks regained it by the peace of Belgrade in 1739. For upwards of four centuries the Serbs groaned under the Turkish yoke, until, in 1804, unable to endure the oppression of the Turkish *dahis*, they broke out into rebellion under George Petrovich, surnamed *Tsrni*, or "Black George" (in Turkish *Kara*). Kara George was born at Topola (Tapolja) in 1767; at first he merely aimed at conquering the *dahis*, but afterwards he attempted to drive the Turks out of Servia. This he succeeded in doing after many failures.

In 1813, however, they reconquered the country, and George with his adherents was compelled to fly to Austria. He returned in 1817, but was treacherously murdered by order of Milosh Obrenovich, who had now become the Servian leader. We have no space here to sketch the struggles of Milosh to secure the independence of Servia, for indeed he was himself of peasant origin and in his youth had been a swine-pend-herd. The Turks had contrived to kill or drive out of the country enca. all the Servian aristocracy, leaving only peasants to till the ground, feed swine (one of the great industries of the country), and pay the *harach*. Milosh was declared prince by the national assembly, and in 1830 secured the consent of the Porte to his enjoyment of the title with the succession reserved to his family. Turkey allowed Servia a quasi-independence, but held and garrisoned several fortresses. Milosh had so little forgotten his Turkish training that he made himself obnoxious to his subjects by his despotic acts. He was a man of simple, even coarse habits, as many of the anecdotes told of him testify. He was compelled to abdicate in 1839 in favour of his son Milan, who, however, was of too feeble a constitution to direct the government, and, dying soon afterwards, was succeeded by his younger brother Michael. He also abdicated in 1842 and the Serbs then elected Alexander, the son of Tsrni George, or, to give him his Servian patronymic, Karageorgevich. His rule lasted seventeen years; he was compelled to resign in 1859, and Milosh, now very old, was invited to come from Bucharest. He lived, however, only one year, dying in 1860, and left the throne to his son Michael, then aged forty, who was thus a second time elected prince of Servia. Michael was a man of refinement and had learned much during his exile. The condition of the country improved during his reign, and in 1862 he succeeded in getting the Turkish garrisons removed from Belgrade. The Moslem inhabitants have gradually withdrawn from the country, so that they are now represented by a very few families. Of the two mosques still remaining in Belgrade, one is devoted to their use, the other having been turned into a gas-work. While walking in his park, called Koshutniak or Topshidere, near Belgrade, Michael was assassinated by the emissaries of Alexander Karageorgevich on 10th June 1868. He was succeeded by his second cousin, Milan, grandson of Yephrem, a brother of Milosh. Milan was born in 1854; he became prince of Servia in 1872. In 1875 he married a Russian lady, Natalie de Keczo. In 1878 the Serbs declared war against Turkey, but their arms were unsuccessful, and they were only saved by the intervention of Russia. By the treaty of Berlin, July 1878, the country received a large accession of territory, and the prince caused himself to be proclaimed king. Peace continued till the year 1885, and during this period the Serbs seemed to make considerable progress as a nation, in spite of the bitterness of political faction. In 1885, however, Servia made an ill-judged and selfish attack upon Bulgaria, which was ignominiously beaten off.

LITERATURE.

For some account of the Servian language, see SLAVS.

Under Servian literature the Dalmatian and Croatian in the limited sense of the term must be included. The latter, however, is somewhat meagre. This literature is divided into three periods—(1) from the earliest times to the fall of Servian independence at the battle of Kosovo, 1389; (2) from the rise of the importance of Ragusa in the 15th century till its decay towards the end of the 17th; (3) from the time of Dositei Obradovich to the present day.

First Period.—The earliest composition which has come down to Early us in the Servian or Illyrian language, to use a term in which we chroni-may include the Dalmatian Slavs, who are essentially the same cles. people, is the production of an unknown priest of Dioclea (Doclea), now Dukliya, a heap of ruins, but formerly a city of considerable importance on the river Moratza. His title in Latin is "Anonymus Presbyter Diocleus," or in Slavonic "Pop Dukljanin." He must have lived about the middle of the 12th century, as the chronicle compiled by him extends to the year 1161. It is a tedious production, and possesses only antiquarian interest; it is printed by Kukuljević Sakcinski¹ in the *Arhiv za Povestnicu Jugoslavenskou* (Agram, 1851). The oldest documents of the Servian language in the narrower sense of the term are a letter of Kulin, the ban of Bosnia in 1189, and the letter of Simeon or Stephen Nemanya to the monastery of Chilander on Mount Athos. These productions are simply Palaeoslavonic with a mixture of Serbisms. The history of early Servian literature has been thoroughly investigated by Schafarik in his *Serbische Lesekörner* (Pesth, 1853). We have only space to mention the more important productions. (1) *The Life of St Simeon* by his son St Sabbas or Sava, the first archbishop of Servia, was written about 1210. The early manuscripts have been lost and the oldest copy known only dates from the 17th century. Besides this work, Sava also compiled a *tipik* or collection of statutes for the monastery of Studenitza, of which he was hegoumen or abbot. He was the founder of the celebrated Chilander monastery. (2) *The History of St Simeon and St Sabbas* by Dometian was compiled in 1264, and is preserved in a manuscript of the 14th century.

¹ In citing the names of those members of the Servo-Croatian race who use Latin letters the original orthography is preserved.

There is a good edition by Danichich, to whom we are indebted for a valuable lexicon of Old Servian. (3) The *Rodosloff* or *Lives of Servian kings and archbishops*, compiled by Archbishop Daniel (died 1338), contains the lives of Kings Radoslaff, Vladislaff, Urosh, Dragutin, Queen Helena, Milutin, &c. After his death the work was continued by an anonymous writer. The style of these productions is dry and tasteless. They are written in Palaeoslavonic mixed with Serbisms. Hilferding has commented with great severity on their bombastic and panegyric style,—the most complimentary epithets being applied to many sovereigns whose careers were stained with crimes. (4) The *Life of Stephen*, surnamed "Dechanski," from the monastery Dechani which he founded, written by Gregory Tzamlak, hegoumen of the same monastery. (5) In 1359 we have the Code of Laws (*Zakonik*) of Stephen Dushan, which has been previously mentioned; it is the earliest specimen of Servian legislation, and has come down in several manuscripts, being first published by Raich in his *History* at the close of the 18th century. Since that time other editions have appeared, the two most important being those of Miklosich and Novakovich.

Servian
ballads.

Second Period.—To this epoch, which may be said to commence with the 15th century, belong some of the Servian chronicles, the *Lyetopis Koprimnichki* and others,—dry and tedious compilations; the 15th century saw also the outburst of the literature of Ragusa (see below). The Servian ballads have obtained a European celebrity, and must have existed from very early times. Nicephorus Gregoras, who in 1325-26 came to Stephen Urosh IV. as ambassador from the Byzantine emperor Andronicus, noticed that some Serbs attached to his suite sang tragic songs celebrating the great exploits of their national heroes. As M. Pipin remarks in his *History of Slavonic Literature*, this shows the existence of a national epic among the Serbs before the battle of Kosovo. In the description of an embassy sent from Vienna to Constantinople in 1551 a certain Kuripeshich, by birth a Slovene, speaks of hearing songs sung in honour of Milosh who slew Sultan Murad. The first attempt at collecting them was made by the Franciscan monk Andrew Kazić-Miošić, a Dalmatian, who died in 1785. His work was published at Venice in 1756 under the title of *Razgovor Ugodni Naroda Slovinskoga* (Recreations of the Slavonic People). Some of the pieces included in this volume were written by Miošić himself, and he made many alterations in the old ones. This, however, was quite in the spirit of the age in which he lived. We find extracts from Servian ballads in some of the Dalmatian poets of the 16th century. In 1794 they were alluded to in the *Travels* of the abbé Fortis, and were finally collected by Vuk Stephanovich Karajich and published at Leipzig in 1824 under the title *Narodne Srpske Pjesme* (Popular Servian Songs). Some of them were afterwards translated into German by Theresa von Jacob and into English by Bowring and Lord Lytton. The versions of the last two possess but little merit. It would be impossible in a short notice like the present to discuss the contents of these remarkable ballads. To the majority of readers the cycle which treats of Knez Lazar and his fate at the battle of Kosovo will prove the most interesting. Besides historical persons introduced in the ballads, there is the half-mythical hero Marco Kraljević, who, like the Russian Ilya Murometz, has many of the characteristics of a supernatural being. His victories, chiefly over Turks and Magyars, are narrated in the most bombastic phraseology. At last he dies in battle; but the belief prevails that he remains concealed till he shall appear on some future occasion to rescue his people from their oppressors. Almost as mysterious as the hero himself is his horse Sharatz, who was presented to him by a *vila* or fairy. After the death of Vuk Stephanovich (1864) a supplementary volume was published by his widow, which her husband had left prepared for the press *Srpske Narodne Pjesme iz Hercegovine* (Popular Servian Songs from Herzegovina, Vienna, 1866). A good collection of songs of the Montenegrins (Tsmnogortzi) was edited at Leipzig in 1857 by Milutinovich. There has also appeared a little volume of Servian national songs from Bosnia, collected by Bogolub Petranovich in 1867. Since then volumes of Servian popular poetry by Rayachevich and Ristich have appeared.

Ragusan
era.

During this period Slavonic literature reached a high pitch of culture in the little city of Ragusa, called in Slavonic Dubrovnik. During the 15th, 16th, and 17th centuries this city, now in a state of decay, was a kind of Slavonic Athens. To the influence of Italian literature was added the culture introduced by the crowds of learned Greeks,—Chalcocondylas, Lascaris, and others,—who found refuge within its walls after the fall of Constantinople. Lyrics and the lyric drama seem to have been the general productions of the more noteworthy authors. The influence of Italian is perceptible throughout. The first writer of eminence was Hannibal Lucić, a very popular poet in his day, author of love-songs, a drama *Robinja* (The Female Slave), and translations published first by his son Anthony at Venice in 1556, and reprinted by Dr Gaj at Agram in 1847. A very interesting poem by this author is his *Eulogy* of the city of Dubrovnik (Ragusa). Another writer of considerable reputation was Nicholas Vetranić-Cavčić (1482-1576), who afterwards became a monk and lived as a hermit on one of the islands on the Dalmatian coast. He has left several

plays and, besides translating the *Hecuba* of Euripides, wrote several mysteries, in the style of the religious plays once so popular throughout Europe; of these the *Sacrifice of Abraham* is the best. His poem entitled *Italy* is remarkable for the warm affection it expresses for the country of his education. Peter Hektorević (1486-1572) was a rich proprietor of the island of Zara, and is worth mentioning as having shown a taste for the national poetry of his country. He has introduced some songs in his *Ribanje i Ribarsko Prigovoranje* (Fishing and a Dialogue of Fishermen). Very celebrated in its time was the *Jegjupka* or Gipsy of Andrew Čubranović (1500-1559), who was originally a silversmith. His poem of the *Gipsy* is said to have been evoked in the following manner. Čubranović was on one occasion following a young lady and urging his suit when she turned round and said scornfully in Italian to her attendant, in the hearing of the poet, "Che vuole da me questo Zingaro?" ("What does this Gipsy want with me?"). The despised lover took up the word of reproach and wrote a poem in which he introduced a Gipsy prophesying to a company of ladies their various fortunes and concluding with an expostulation to the hard-hearted beauty for her obduracy. Schafarik speaks of this piece with great enthusiasm and calls it "a truly splendid flower in the garden of the Illyrian Muses." The Russian critic Pipin supposes, with great probability, that the poem was written as a sort of masquerade for the carnival. It enjoyed considerable popularity and was frequently imitated. A similar story is said to have suggested the *Dervise* (Dervish) of Stjepo Gučetić, in which the author represents himself as a Turkish dervish. These two pieces are elegant productions in the Italian manner.

Nicholas Nalješković (1510-1587) was a native of Ragusa and author of several pastoral plays in the style then so much in vogue throughout Europe. Of the same description are the productions of Marino Držić (1520-1580), of whom his contemporaries praised "il puro, vago, e dolce canto." Mention may also be made of Dinko Ranjina and Mauro Orbin (d. 1614). Another celebrated poet was Dominco Zlatarić (1556-1607), who, besides translating the *Electra* of Sophocles, produced a version of the *Aminta* of Tasso and has left several minor pieces. The chief of the Ragusan poets, however, was Ivan Gundulić (sometimes called by his Italian name of Gondola). Very few facts are known of his life; but he died in 1658 aged fifty, having discharged several important public offices. His death, says Schafarik, was not too early for his fame but too early for literature and the glory and prosperity of his country. He himself published but little, and many of his writings perished in the earthquake in 1667, after which Ragusa never regained her former prosperity. The so-called Petrarchan school of Illyrian poetry languished after this and wasted its energy on elegant trifles. Dalmatian poets of the 18th and 19th centuries have not made any considerable figure. The *Osman* of Gundulić, on which his fame rests, is an epic in twelve books, and was written to celebrate the victory of the Poles under Chodkiewicz over the Turks and Tatars in 1622 at Chocim (Khotin). Schafarik praises Gundulić for the richness of his imagination, the lofty tone of his verse, and its perfectly constructed rhythm. We are willing to allow that *Osman* possesses considerable spirit and that the versification is melodious, but on the whole it seems a tedious poem. The short quatrains in which it is written lack the true epic dignity. Leaving the Dalmatians, the only writer worthy of mention among the Serbs is George Brankovich (1645-1711), the last despot, who compiled a *History of Servia till the end of the 17th Century*, which has been edited by Chedomil Miyatovich, ambassador from the court of Servia to St James's (1886). From this period till the close of the 18th century there is no Servian literature: the spirit of the people seems to have been crushed out of them by Austrian persecutors on the one hand and by Turkish on the other. Till the reign of Milosh Obrenovich in the 19th century hardly a Servian printed book was to be seen. The works of Yuri Krizhanich, who, although a Serb, wrote in Russian, are mentioned under RUSSIA (p. 105).

Third Period (from 1750).—The spark of nationality was still burning among the Serbs, in spite of their degradation, and men were found to fan it. Such a man was Raich (1720-1801), a Raich, thorough patriot. He was born in Slavonia, a province of Austria inhabited by Serbs, the son of poor parents, but he had all the enthusiasm for learning that animated the Russian Lomonosoff, whom he very much resembled. Thus we find him making his way on foot from his native town to Kieff, where he was received into the ecclesiastical seminary and devoted himself to theology. After spending three years at Kieff, he betook himself to Moscow. Meeting, on his return to his native country, with a cold reception from those whom he had expected to foster his studies, he went back to Russia, and while at Kieff resolved to write the history of the Servian nation. Knowing that the Slavonic monasteries in European Turkey contained many unpublished manuscripts (numbers of which have since perished in the wars which have devastated the country or have been destroyed by the Greeks), he visited Constantinople and many other parts of that empire in order to collect materials. On his return to Austria he took up his abode at Neusatz on the Danube (also long the headquarters of Schafarik),

Obradovich.

Minor writers.

Croatian literature.

and worked at his history, which he finished in 1768, but it was not published till upwards of twenty years later. In 1772 he became a monk, and he died in 1801. The work of Raich, though interesting as a monument of learned industry, does not now possess much critical value. The style is harsh and a great deal of the ethnology (a science then in its infancy) unsound. Thus, among other strange statements, he holds the Bulgarians on the Volga to have been Slavs. After Raich we come upon two indefatigable Servian workers, Dositei Obradovich (1739-1811) and Vuk Stephanovich (1787-1864). The life of the former has been written by himself. He was a man of varied learning, and his career was marked by many curious adventures. After having visited nearly every part of Europe (including England, where he was received with great hospitality),¹ Obradovich returned to Serbia and became tutor to the children of Tsrni George. He was a man sprung from the people, and an indefatigable and successful labourer for national education. The list of his compilations and translations is considerable. Acting on the wise principle that the language *as it is spoken* should be cultivated and not a jargon overloaded with archaic and supposed classical forms, he did good by destroying the influence of the Palaeoslavonic among his countrymen. Before his death his services to his country were recognized by his appointment as member of the senate and superintendent of national education. The man, however, who was destined to bring the Servian language into the greatest prominence was Vuk (Wolf) Stephanovich Karajich, whose collection of songs was mentioned above. Vuk was an indefatigable scholar and patriot. Till his time the Servian language had been, so far as all foreigners were concerned, simply *rudis indigestaque moles*. He wrote a good grammar, which has formed the basis of all published since, and to this Jacob Grimm furnished a preface. To him also we owe a Servian dictionary and a collection of tales and proverbs. His supposed innovations in the Servian language with regard to the rejection of archaisms and the introduction of a new system of orthography raised up a host of enemies against him, so that not only was he forbidden to enter Serbia but his books were excluded from the country. He died at the beginning of 1864, but permission to make use of his innovations was not given till four years afterwards.

A complete enumeration of the Servian and Croatian authors of the 19th century would far exceed the limits of this article. But Matthias Anthony Relković (1732-1798) deserves mention, because he wrote in a dialect but little cultivated, viz., the Slavonian in the restricted sense, as applied to the Austrian province of that name. He published in 1761 a successful satire entitled *Satir Uiti Divi Csovik* (Satire or the Clever Man), at Dresden. A few names, each of which marks a definite feature of the literature, must suffice. Lucian Mushitzki (1777-1851), an archimandrite, afterwards bishop of Carlowitz, was highly esteemed by his countrymen as a poet. His odes are full of patriotic feeling. Yovan Hadchich (1799-1870) wrote under the *nom de plume* of Milosh Svetich. For some time he was an authority in Servian literature, but ultimately his influence waned. Simeon Milutinovich, a noted writer, whose life was full of strange adventures, composed an epic poem entitled *Serbianka*, which describes the chief incidents of the Servian war in 1812. It was published at Leipsic in 1826. We have previously alluded to his collection of Montenegrin songs. He is also the author of a tragedy on Milosh Obilich, who slew Sultan Murad. Milutinovich, who was a Bosnian, died in poverty in 1847. Yovan Popovich (1806-1856), a native of the Banat, was a writer of much industry and merit, and gained a considerable reputation by his plays, the subjects of which were taken from Servian history and were put upon the stage with considerable effect. Without being a great dramatic writer, he had the art of constructing pieces to which people would listen,—something like Sheridan Knowles. To this circle belongs also Yuri Maletich, author of *Spomenik Lukianom Mushitzkom* (A Memorial to Lucian Mushitzki), and also the *Apotheosis of Kara George*. In 1847 the well-known journal *Glasnik* (The Messenger) was founded, which has continued to the present time and contains many valuable papers on Servian history and literature. Schafarik had previously founded at Neusatz (Novi Sad) the *Matitza Srbska*, an excellent society for printing Servian books.

The Croats have also been active in modern times. The remarkable poem, *Death of the Agha Ismail Cengic*, by Ivan Mažuranić (born in 1813), is said to be so popular among the Serbs, as stimulating their hatred of the Turk, that it has been called "The Epos of Hate." Ismail was the descendant of an old Bosnian family who had turned Mussulmans to keep their estates when the country was first invaded. These renegades, as might be expected, are more fanatical than the Turks themselves. His exploits were chiefly directed against the Uskoks and the Montenegrins. The poem is composed in the same metre as that of the Servian ballads collected by Vuk. It is spirited, but has a savage air about it, engendered by the scenes described, the fierce border wars of long hereditary

hatred. The account of the cruelties committed by the Turks while collecting the *harach* and the conclusion, where the body of the slain Agha is brought to the hermit, are dramatically conceived.

The four most celebrated Servo-Croatian poets are Stanko Vraz, Servo-Preradović, Yovanovich, and Radichevich. Stanko Vraz (1810-Croatian 1851) was by birth a Slovene; he joined, however, the Illyrian poetry movement under Ljudevit Gaj and used the Servo-Croatian language. The attempt of Gaj to form a common literary language under the name of Illyrian by fusing the Servo-Croat and the Slovenish languages was not successful. Perhaps the only result, if it had been persevered in, would have been that the Slovenes would have become completely Germanized, as a pedantic literary language would not have been understood by the peasants. Besides many graceful lyrics, Vraz also published collections of national songs. Some of his shorter pieces are very elegant and have a rich Oriental colouring. Peter Preradović (1818-1872), a native of the Military Frontier and a general in the Austrian army, is the author of many graceful lyrics, widely known throughout all Servian-speaking regions. A complete edition of his works appeared in 1873. Peter Yovanovich (born in 1801) is the author of many popular poems. But no one of the later generation of Servian authors has gained such a reputation as Branko Radichevich, who was born in the Austrian Banat in 1824, and ended his short life at Vienna in 1858. His popularity rests upon the patriotism shown in his writings and their spirited tone. Nor have the Servo-Croats lacked important workers in the fields of history and philology. Among these must be mentioned Dyuro Danichich (1825-1882), who was educated partly at Pesth and partly at Vienna, at the latter university becoming the pupil of Miklosich. He first made himself conspicuous by espousing the cause of Vuk Stephanovich Karajich in the dispute about Servian orthography. Besides contributing valuable papers to the *Glasnik*, he was the author of an Old Servian dictionary of great service to students. He edited, as previously mentioned, the memorials of Old Servian literature. At the time of his death he was engaged upon a great Servo-Croatian dictionary, a work which, it is to be hoped, will be continued by some of his pupils. Ljudevit Gaj (1809-1872), who has already been mentioned, was a Croat and laboured to bring about a national unity. His services were invaluable as an editor of the Old Dalmatian classics. Armin Pavić (still living) has written a good history of the Dalmatian drama (*Historija Dubrovačke Dramme*, Agram, 1871). Stoyan Novakovich (born 1842), at one time minister of public instruction, besides contributing valuable articles in the *Glasnik*, has published an historical chrestomathy of the Servian language and an edition of the *Zakonik* of Stephen Dushan. Another worker in the same field was Chedomil Miyatovich, previously mentioned. One of the most indefatigable and patriotic of modern Croatian scholars is Ivan Kukuljević Sakcinski, who has edited, besides many early Croatian and Servian works, an admirable *Arhiv za Povestnicu Jugoslavenskiju* (Collection of Documents for South Slavonic History), of which several volumes have appeared,—a veritable storehouse of Slavonic history, archæology, and literature. He has found an excellent coadjutor in Dr Francis Rakci (born 1829), among whose works may be mentioned *Pismo Slonjensko* (Slavonic Writing, Agram, 1861), *Odlomci iz Državnoga prava Horvatskoga* (Fragments of Croatian Law, 1861), and many excellent historical articles in the journals *Pozor* (The Observer) and *Rad* (Labour).

After Miklosich, the most indefatigable worker in the field of Slavonic literature now living is the Croat Ignaz Vatroslav Jagić (born 1835), formerly a professor at Berlin, who now occupies the ture chair of Slavonic philosophy at St Petersburg, in the place of gener-Sreznevski. He has published many valuable works on Slavonic ally, philology, such as (in 1867) a *History of Servo-Croatian Literature*, also a reading-book with specimens of early Glagolitic and Cyrillic works (*Primeri Starohervatskoga Jezika*). He has also edited two of the oldest Slavonic codices, *Marianus* and *Zographensis*. Moreover, in 1875 he founded the well-known *Archiv für slavische Philologie*, which he still edits with the co-operation of many Slavists. Sime Ljubić is another worker in the field of Slavonic history and literature. To the excellent literary journals already mentioned may be added the *Starina*, published at Agram. Valuable works have been written by Balthasar Bogišić on the house-communities of the southern Slavs and south Slavonic law generally. His labours have been made use of by Sir Henry Maine. One of the most celebrated of living Servian poets is Matthias Ban, the author of several poems and plays, which have been very favourably received.

A few words may be added here on Montenegrin history and Monte-literature, the details of which are but scanty. On the death of negro Stephen Dushan, a certain prince Balsha became independent ruler of Zeta. Many fugitives betook themselves to the little retreat after the battle of Kosovo. Ivan Chernoyevich settled in Tzetyne (Cettinje) in 1485 and built a church and a monastery. In 1516 his son and successor retired to Venice, and Montenegro was governed by a national assembly and a vladika (prince bishop). The country was ruled by vladikas of various families till 1697. In that year the office became hereditary in the family of Petrovich of Negosh. Originally the ecclesiastical and civil functions were combined in

¹ To show the opinion entertained of him in Britain it is only necessary to note the inscription in a book presented to him by Dr Fordyce, an eminent London physician of the time: "Dositheo Obradovic, Serbiano, viro linguis variis erudito, sanctissimis moribus morato," &c.

the person of the vladika, but they were separated on the death of Peter II. in 1851. The latter was the author of some poems in the Servian language, the most celebrated being *Loucha Mikrokozma* (The Light of the Microcosm), which appeared at Belgrade in 1845. He was succeeded by his son Daniel, first prince of Montenegro, who, dying in 1860, was followed by his nephew Nicholas, the most memorable events of whose reign have been the war with Turkey and the increase of his territory by the treaty of Berlin. (W. R. M.)

SERVITES (Servi Beatæ Mariæ Virginis). This religious order owes its origin to Bonfiglio Monaldi, a Florentine, who in 1233 withdrew along with six of his comrades to the Campo Marzo near the city for prayer and ascetic exercises in honour of the Virgin. Three years afterwards they removed to Monte Senario, where their numbers were considerably increased. The order at a very early period received from Bishop Ardingus of Florence the rule of St Augustine, but did not obtain papal sanction until 1255. It rapidly spread into France, Germany, the Low Countries, Poland, and Hungary, and from Martin V. it received in 1424 the privileges of the mendicant orders. The Servite Tertiaries were founded about the same time by Giuliano Falconieri. Under Bernardino de Ricciolini arose the Hermit Servites (1593). The members of the order (Observants and Conventuals) are now found chiefly in Italy, Hungary, Austria, and Bavaria.

SERVIUS, the commentator on Virgil, is all but unknown to us, so far as personal information goes. From notices in the *Saturnalia* of Macrobius, where he appears as an interlocutor, we may infer that in or about 380, though still quite young, he was already distinguished as a "grammaticus," that is, as an expert in the criticism, explanation, and teaching of the classical literature of Rome. Servius therefore belongs to the latter half of the 4th and the earlier years of the 5th century, to the age of Symmachus and Claudian, of Jerome and Augustine. The allusions of Macrobius and a short letter from Symmachus to Servius leave no doubt that the grammarian formed one of that band of cultivated men, led by Symmachus, whose eyes were turned towards the pagan past and away from the Christian future, and who breathed into pagan culture its last transient sparks of life and vigour. The race of "grammatici" to which Servius belonged, and which had now run at Rome a course of some 500 years, had done much evil to literature, had helped to corrupt, falsify, encumber, and even in some instances by abbreviations upon abbreviations to kill out the texts on which they worked; but on the whole they had done more good. They had helped to save what could be saved of education, culture, and history, and so had in the main contributed to the preservation of the ancient literature that has come down to us. Of all the "grammatici" none bears on his front more of the virtues and fewer of the vices of the race than Servius. But it must be noted that much which passes under the name of Servius in modern editions, and in modern quotations, most certainly did not proceed from his hand. The comments on Virgil to which his name has been attached come from three different sources. One class of MSS. contains a comparatively short commentary, definitely attributed to Servius. A second class (all going back to the 10th or 11th century) presents a much expanded commentary, in which the first is embedded; but these MSS. differ very much in the amount and character of the additions they make to the original, and none of them bear the name of Servius. The added matter is undoubtedly ancient, dating from a time but little removed from that of Servius, and is founded to a large extent on historical and antiquarian literature which is now lost. The third class of MSS., written for the most part in Italy and of late date, repeats the text of the first class, with numerous interpolated scholia of quite recent origin and little or no value.

The real Servian commentary (for so we must designate the text that we find in the first class of MSS.) practically gives the only complete extant edition of a classic author written before the destruction of the empire. It is constructed very much on the principle of a modern edition, but with very different ideas both as to the relative and the absolute value of the matters treated. Owing to the delicacy and originality of his veiled style, to the innumerable threads of ancient history, mythology, and antiquities shot through the texture of his poems, owing above all to the firm hold he early gained upon the Latin schools, Virgil had a continuous line of expounders stretching almost from his death to the destruction of the Roman government of the West. Servius built his edition in part on the extensive Virgilian literature of preceding times, much of which is known only from the fragments and facts he has preserved. The notices of Virgil's text, though seldom or never authoritative in face of the existing MSS., which go back to, or even beyond, the times of Servius, yet supply valuable information concerning the ancient recensions and textual criticism of Virgil. In the grammatical interpretation of his author's language, Servius does not rise above the stiff and overwrought subtleties of that day; while his etymologies, as is natural, violate every law of sound and sense. As a literary critic the shortcomings of Servius are great, if we judge him by a modern standard, but he shines if compared with his contemporaries. In particular, he deserves credit for setting his face against the prevalent allegorical methods of exposition. But the abiding value of his work lies in his preservation of facts in Roman history, religion, antiquities, and language which but for him might have perished. Not a little of the laborious erudition of Varro and other ancient scholars, to whom time has proved unkind, has survived in Servius's pages. The older MSS. sometimes add to the name Servius that of Magister (given to other distinguished grammarians at different times); the later Italian MSS. in some cases give his name as Maurus Servius Honoratus. Besides the Virgilian commentary, we have other works of Servius,—a collection of notes on the grammar (*Ars*) of Donatus; a treatise on metrical endings; the tract *De Centum Metris* or *Centimeter*.

The most noted editions of the Virgilian commentary are by Fabricius (1551); P. Daniel, who first published the enlarged commentary (1600); and by Thilo and Hagen (Leipzig, 1878-84). The *Essai sur Servius* by E. Thomas (Paris, 1880) is an elaborate and valuable examination of all matters connected with Servius; many points are treated also by Ribbeck in his "Prolegomena" to Virgil, and by Thilo and Hagen as above. The smaller works of Servius are printed in Kell's *Grammatici Latini*.

SERVIUS TULLIUS, the sixth king of Rome, described in one account as originally a slave, is said to have married a daughter of Tarquin, and to have gained the throne by the contrivance of Tanaquil, his mother-in-law. Another legend represented him as a soldier of fortune originally named Mastarna, from Etruria, who attached himself to Cæles Vibenna, the founder of an Etruscan city on the Cælian Hill. Servius included within one circuit the five separately fortified hills which were then inhabited and added two more, thus completing the "Septimontium"; the space thus inclosed he divided into four "regiones," the Suburana, Esquilina, Collina, and Palatina (see *ROME*, vol. xx. p. 813). For his contributions to Roman law see *ROMAN LAW*, vol. xx. p. 669 sq., and for his reforms of the constitution see *ROME*, vol. xx. pp. 734-735. His legislation was extremely distasteful to the patrician order, and his reign of forty-four years was brought to a close by a conspiracy headed by his son-in-law Tarquinius Superbus. The street in which Tullia drove her car over her father's body ever after bore the name of the "Vicus Sceleratus."

SESAME, the most important plant of the genus *Sesamum* (nat. ord. *Pedaliaceæ*), is that which is used throughout India and other tropical countries for the sake of the oil expressed from its seeds. *S. indicum* is an herb 2 to 4 feet high, with the lower leaves on long stalks, broad, coarsely toothed or lobed. The upper leaves are opposite, lanceolate, and bear in their axils curved, tubular, two-lipped flowers, each about $\frac{3}{4}$ inch long, and pinkish or yellowish in colour. The four stamens are of unequal length, with a trace of a fifth stamen, and the two-celled ovary ripens into a two-valved pod with numerous seeds. The plant has been cultivated in the tropics from time immemorial, and is supposed on philological grounds to have been disseminated from the islands of the Indian Archipelago, but at present it is not known with certainty in a wild state. The plant varies in the colour of the flower, and especially in that of the seeds, which range from light yellow or whitish to black. Sesame oil, otherwise known as gingelly or til (not to be confounded with that derived from *Guizotia oleifera*, known under the same vernacular name), is very largely used for the same purposes as olive oil, and, although less widely known by name, is commercially a much more important oil; thus, apart from the almost universal use of the oil in India, from 50 to 80 millions of kilogrammes of the seed are stated to have been introduced annually into France in 1870–1872. The seed is also largely exported from Zanzibar and Formosa. The seeds and leaves also are used by the natives as demulcents and for other medicinal purposes. The soot obtained in burning the oil is said to constitute one of the ingredients in India or Chinese ink. The plant might be cultivated with advantage in almost all the tropical and semi-tropical colonies of Britain, but will not succeed in any part of Europe.

SESOSTRIS (Σέσωστρις, so Herodotus; Diodorus writes *Sesosis*; other forms are *Sesonchosis*, *Sesosis*, *Sesothis*, &c.) is according to Greek historians the name of a king of Egypt who conquered the whole world, even Scythia, the lands of the Ganges, and Æthiopia, which were not subject to any of the later great empires. The conqueror in whose exploits these extravagant legends took their rise was Ramses II. (see EGYPT, vol. vii. p. 739); but the Greek accounts unite in his person all the greatest deeds of the ancient Pharaohs, and add much that is purely imaginary. In Manetho's lists Sesostris is identified with a much older king, Userthesen II., perhaps because authentic tradition made him the conqueror of Æthiopia (see vol. vii. p. 734). When Herodotus says that he himself saw monuments of Sesostris in Palestine, he has been thought to refer to the figures of Ramses II. hewn in the rocks of Nahr-al-Kalb, near Beirût, but they do not agree well with his description (Hdt., ii. 102–106), which seems to point rather to Astarte pillars (*Asherim*). The monuments in Ionia of which he speaks still exist in the Karabel Pass. They are not Egyptian but so-called "Hittite," i.e., probably Cappadocian. See Wright, *Empire of the Hittites*, last plate.

SESSA, a town of the kingdom of Italy, province of Terra di Lavoro, situated among hills on the site of the ancient *Suessa Aurunca*, on a small affluent of the Gargliano, is 17 miles east of Gaeta and half a mile from Sant' Agata. The hill on which Sessa is situated is a mass of volcanic tufa, in which have been discovered painted chambers erroneously supposed to have belonged to a city covered by a volcanic eruption. The town contains many ancient remains, particularly the ruins of Ponte Aurunca and of an amphitheatre. It is the see of a bishop, has an interesting basilica with three naves, a gymnasium, a technical school, and a seminary. The cathedral contains inscriptions, a mosaic pavement, and a good ambo decorated with mosaics resting on columns. In the principal street

are memorial stones with inscriptions in honour of Charles V., surmounted by an old crucifix with a mosaic cross. Exclusive of the environs, the town has a population of 6130. The hills of Sessa are celebrated for their vines, the "Ager Falernus" of the Romans.

SESSION, COURT OF. See SCOTLAND, p. 535 *supra*.

SETTLE, ELKANAH (1648–1723), a minor poet and playwright of the Restoration period, immortalized by the ridicule of Dryden and Pope, was born at Dunstable in 1648. He is the "Doeg" of the second part of *Absalom and Achitophel*, and is treated by the satirist with somewhat more good-humoured contempt than his companion in the pillory—Shadwell.

Doeg, though without knowing how or why,
Made still a blundering kind of melody;
Spurr'd boldly on, and dash'd through thick and thin,
Through sense and nonsense, never out nor in.

Dryden treats him as a sort of harmless fool, who "rhymed and rattled" along in perfect satisfaction with himself. For some time also he was taken by the public at his own valuation. At college he seems to have been regarded as a prodigy, and his juvenile verse was preferred to Dryden's. Coming to London, he began to produce tragedies. His *Empress of Morocco* (acted in 1673, when the author was twenty-five) was a signal success on the stage, and is said by Dennis to have been "the first play that was ever sold in England for two shillings, and the first that was ever printed with cuts." Puffed up by this success, Settle made haughty allusions in his preface, which excited the ire of his contemporaries; and Dryden co-operated with Crowne and Shadwell in writing sarcastic notes on *The Empress*. Settle's next collision with Dryden was also provoked by himself. He attempted a counterblast to Dryden's great satire in *Absalom Senior*, and was contemptuously demolished in return. Settle was then comparatively a young man, his age being thirty-five, but he had touched the height of his fame, and the remaining forty years of his life were not so successful. Dryden mockingly said of him that his ambition was to be "the master of a puppet-show," alluding to his duties in the office of city poet, in which he was one of the successors of Lodge, Middleton, Jonson, and Quarles; and to this he was literally reduced in his old age, keeping a booth at Bartholomew Fair, where he is said to have played the part of the dragon in green leather. He died in the Charterhouse in 1723.

SETTLEMENT, in law, is a mutual arrangement between living persons for regulating the present or future enjoyment of property. It also denotes the instrument by which such enjoyment is regulated. The prevailing notion of a settlement is the dealing with property in a manner different from that in which the law would have dealt with it apart from the settlement. Definitions of settlement for the purposes of the Acts are contained in the Acts of 1856, 1877, and 1882 (see below). They are, however, scarcely sufficient for a general definition. On the one hand they are too extensive, and include wills; on the other they are not comprehensive enough, as they apply only to real estate. They also include only cases of successive limitations, but the idea of succession does not in itself seem a necessary part of the conception of settlement, although no doubt most settlements contemplate successive enjoyment. Settlements may be either for valuable consideration or not: the latter are usually called voluntary, and are in law to some extent in the same position as revocable gifts; the former are really contracts, and in general their validity depends upon the law of contract. They may accordingly contain any provisions not contrary to law or public policy.¹

¹ In this English law allows greater freedom than French. By § 791 of the Code Napoléon, in a contract of marriage the succession to a living person cannot be renounced.

The elements of the modern settlement are to be found in Roman law. The *vulgaris*, *pupillaris*, or *exemplaris substitutio* (consisting in the appointment of successive heirs in case of the death, incapacity, or refusal of the heir first nominated) may have suggested the modern mode of giving enjoyment of property in succession. Such a *substitutio* could, however, only have been made by will, while the settlement of English law is, in the general acceptance of the term, exclusively an instrument *inter vivos*. The *dos* or *donatio propter nuptias* corresponds to a considerable extent with the marriage settlement, the instrument itself being represented by the *dotale instrumentum* or *pacta dotalia*. In the earliest period of Roman law no provision for the wife was required, for she passed under *manus* of her husband, and became in law his daughter, entitled as such to a share of his property at his death. In course of time the plebeian form of marriage by *usus*, according to which the wife did not become subject to *manus*, gradually superseded the older form, and it became necessary to make a provision for the wife by contract. Such provision from the wife's side was made by the *dos*, the property contributed by the wife or some one on her behalf towards the expenses of the new household. *Dos* might be given before or after marriage, or might be increased after marriage. It was a duty enforced by legislation to provide *dos* where the father possessed a sufficient fortune. *Dos* was of three kinds:—*profectitia*, contributed by the father or other ascendant on the male side; *adventitia*, by the wife herself or any person other than those who contributed *dos profectitia*; *receptitia*, by any person who contributed *dos adventitia*, subject to the stipulation that the property was to be returned to the person advancing it on dissolution of the marriage. The position of the husband gradually changed for the worse. From being owner, subject to an obligation to return the *dos* if the wife predeceased him, he became a trustee of the *corpus* of the property for the wife's family, retaining only the enjoyment of the income as long as the marriage continued. The contribution by the husband was called *donatio propter nuptias*.¹ The most striking point of difference between the Roman and the English law is that under the former the children took no interest in the contributions made by the parents. Other modes of settling property in Roman law were the life interest or *usus*, the *fideicommissum*, and the prohibition of alienation of a *legatum*.

The oldest form of settlement in England was perhaps the gift in frankmarriage to the donees in frankmarriage, and the heirs between them two begotten (Littleton, § 17). This was simply a form of gift in special tail, which became up to the reign of Queen Elizabeth the most usual kind of settlement. The time at which the modern form of settlement of real estate came into use seems to be doubtful. There does not appear to be any trace of a limitation of an estate to an unborn child prior to 1556. In an instrument of that year such a limitation was effected by means of a feoffment to uses. The plan of granting the freehold to trustees to preserve contingent remainders² is said to have been invented by Lord Keeper Bridgman in the 17th century, the object being to preserve the estate from forfeiture for treason during the Commonwealth.³ The settlement of chattels is no doubt of considerably later origin, and the principles were adopted by courts of equity from the corresponding law as to real estate.

¹ See Hunter, *Roman Law*, p. 150; Maine, *Early History of Institutions*, lect. xi.

² The appointment of such trustees has been rendered unnecessary by 8 and 9 Vict. c. 106 and 40 and 41 Vict. c. 38.

³ This sketch of the history of settlement is abridged from a paper by the late Mr Joshua Williams, *Papers of the Juridical Society*, vol. i. p. 45.

At the present time the settlement in England is, so far as regards real estate, used for two inconsistent purposes,—to “make an eldest son,” as it is called, and to avoid the results of the right of succession to real property of the eldest son by making provision for the younger children. The first result is generally obtained by a strict settlement, the latter by a marriage settlement, which is for valuable consideration if ante-nuptial, voluntary if post-nuptial. At the same time it should be remembered that these two kinds of settlement are not mutually exclusive: a marriage settlement may often take the form of a strict settlement and be in substance a resettlement of the family estate.

There are three possible varieties of the marriage settlement:—(1) the dotal system (*régime dotal*), under which the husband generally has the usufruct but not the property in the *dos*; this is the system generally followed in countries where the Roman law prevails; (2) the system of community of goods (*communauté de biens*), by which the wife becomes a kind of partner of the husband; this system, said to have been originally the custom of ancient Germany, is in vogue in France and Louisiana; (3) the system of separate property, by which (subject to contract) the wife's property is free from the control of her husband; this system prevails in the United Kingdom and the United States. An ordinary English marriage settlement of personality is a deed to which the parties are the intended husband and wife and trustees nominated on their behalf. It generally contains the following clauses:—a power to vary the investments of the settled property within limits; trusts of the income for the benefit of the husband and wife during their lives; trusts for the issue, usually according to the appointment of the husband and wife or the survivor, and in default for sons attaining twenty-one and for daughters attaining that age or marrying, equally, subject to a “hotchpot” clause, charging the children with the amount of any previous appointments; a power of advancement of the portions of children in anticipation; a trust for the maintenance of infant children after the death of the parents, with a direction for the accumulation of surplus income; ultimate trusts fixing the destination of the settled property in default of issue. The receipt and trustee clauses, at one time usual, have been rendered unnecessary by recent legislation. The Conveyancing Act, 1881, superseding Lord St Leonard's Act of 1859 and Lord Cranworth's Act of 1860, gives power to appoint new trustees, and makes a trustee's receipt a sufficient discharge. Trustees were formerly much restricted in their investments, but various Acts of Parliament have now increased their powers of choice of investment (see TRUST). The settlement of real estate is still a matter of greater difficulty than that of personality, though it has been considerably simplified by recent legislation. A short statutory form of settlement of real estate is provided by the Conveyancing Act, 1881 (Fourth Schedule, Form iv.). The Act further enacts that a covenant by the settlor for further assurance is to be implied. This takes the place of those covenants usually inserted in settlements before the Act, which were the ordinary covenants for title. (See REAL ESTATE.) The Settled Land Act, 1882, gives statutory authority to certain provisions generally inserted by conveyancers. The clauses must, however, still vary infinitely according to the circumstances of particular cases. Where the settlement is of copyholds, the usual course is to surrender them to the use of trustees as joint tenants in fee upon such trusts as will effect the desired devolution of the property.

A strict settlement of real estate usually takes place on the coming of age or marriage of the eldest son, if it be the intention of the parties that the estate should continue undivided. The consideration for the settlement in the first case is usually an immediate allowance made to the son, in the second the marriage itself, a valuable consideration. It will appear on referring to the articles ENTAIL and REAL ESTATE that an estate cannot be entailed for a period exceeding a fixed number of existing lives and an additional term of twenty-one years, but that if it be sought to bar the entail within that period the consent of the protector of the settlement must be obtained. The process of resettlement is thus described by Lord St Leonards: “Where there are younger children, the father is always anxious to have the estate resettled on them and their issue, in case of failure of issue of the first son. This he cannot accomplish without the concurrence of the son; and, as the son, upon his establishment in life in his father's lifetime, requires an immediate provision, the father generally secures to him a provision during their joint lives as a consideration for the resettlement of the estate in remainder upon the younger sons.” The settlement usually takes the form of a life estate for the father, followed by a life estate for the son, with remainder in tail to the unborn child of the son, the continuance of the estate in the family being further secured by a series of cross-remainders. There is often a name and arms clause, under which, by means of a

shifting use (see TRUST), every person succeeding to the settled estate as tenant in tail is forced to assume the name and arms of the settlor under penalty of forfeiture of his estate. Certain parts of the personality of the settlor are often settled upon trusts to devolve with the real estate. In order to attain this end, the chattels are not simply subjected to the same limitations as the real estate. If so subjected, they would vest absolutely in the first tenant in succession, as no estate can be limited in personality (see PERSONAL ESTATE). A declaration is added that they shall not vest absolutely in any tenant until he shall attain twenty-one, and in case he should die under that age that they shall devolve as nearly as possible in the same way as the lands. By means of strict settlement the actual possessor of a settled estate at any given time is in general only a tenant for life. It is a rule of law that in a settlement of this nature there should be a full and complete communication of all material circumstances by the one party to the other.

It is only within a comparatively recent period that any dissatisfaction at the system of settlement has been felt. In 1829 the Real Property Commissioners saw no reason to recommend any alteration of the law as it then existed. To use the words of the First Report, p. 6, "Settlements bestow upon the present possessor of an estate the benefits of ownership, and secure the property to his posterity. The existing rule respecting perpetuities has happily hit the medium between the strict entails which prevail in the northern part of the island, and by which the property entailed is for ever abstracted from commerce,¹ and the total prohibition of substitutions² and the excessive restriction of the power of devising³ established in some countries on the Continent of Europe. In England families are preserved, and purchasers always find a supply of land in the market." This optimistic view, it is scarcely necessary to say, is not the one generally accepted at present. The inconveniences inseparable in an economical point of view from the settlement of land have been proposed to be met in two ways,—(1) by a total prohibition of the creation of life estates (see LAND), and (2) by an extension of the powers of the limited owner. The latter is the one which has hitherto commended itself to the legislature of the United Kingdom.

Up to thirty years ago a settled estate in England or Ireland could be sold or leased only under the authority of a private Act of Parliament. The dealings of the limited owner with his property were practically confined to certain powers of raising money for draining conferred by 8 and 9 Vict. c. 56 and the Public and Private Drainage Acts (now repealed). The first general Act was the Leases and Sale of Settled Estates Act, 1856, which proceeded on the principles generally followed in the private Acts. The Act allowed the tenant for life to demise the premises (except the principal mansion house) for various terms, and to sell with the approval of the court. Several amending Acts were passed, and finally the law was consolidated and amended by the Settled Estates Act, 1877 (40 and 41 Vict. c. 18). Meanwhile the Improvement of Land Act, 1864 (which applies to the United Kingdom), and the Limited Owners' Residence Acts, 1870 and 1871, had been passed. The Act of 1864 allowed the owner of a settled estate to charge upon the land, by way of rent-charge, the expenses of certain improvements, such as drainage, irrigation, inclosing, reclamation, clearing, erection of labourers' cottages and farmhouse buildings, planting for shelter, construction of any buildings which will increase the value of the land for agricultural purposes, and construction of jetties or landing-places on the sea-coast or navigable rivers and lakes. This list of improvements has been since extended by the Settled Land Act, 1882. The Act of 1870 enabled the owners of settled estates to charge such estates with the expense of building mansions as residences. The building of such mansions is by the Act of 1871 an improvement within the meaning of the Act of 1864. The Settled Estates Act, 1877 (40 and 41 Vict. c. 18), allowed the tenant for life, or for a greater estate, of a settled estate, to demise settled land on an agricultural lease for a term not exceeding twenty-one years (in Ireland thirty-five years). The lease must not be without impeachment of waste. This is the only case in which the powers of the Act may be exercised without the leave of the court. The court may authorize leases of any settled estates or of any rights or privileges over or affecting any settled estates, subject to the conditions that—(1) the lease be made to take effect in possession at or within one year next after the making, and be for a term for an agricultural lease as above, for a mining lease not exceeding forty years, a repairing lease sixty years, a building lease ninety-nine years, with power for the court to grant

for a longer term if in accordance with the custom of the district and beneficial to the inheritance; (2) the best rent must be reserved; (3) in a mineral lease three-fourths of the rent is to be invested (one-fourth where the limited owner is entitled to work the minerals for his own benefit); (4) the lease is not to authorize felling of trees except for the purpose of clearing for building; (5) the lease is to be by deed, and is to contain a condition for re-entry on non-payment of rent for twenty-eight days. The court may also authorize sales of settled estates and of timber, and dedication for streets, roads, squares, gardens, sewers, and other works. The application to the court (which in England is the Chancery Division or the Chancery of Lancashire, in Ireland the Chancery Division) is by petition in a summary way with the consent of the persons having any beneficial estate under the settlement, and all trustees having any estate on behalf of any unborn child. The court may dispense with consent under certain circumstances. No application is to be granted by the court where a similar application has been refused by parliament. Money received on sale under the Act is to be invested as the Act directs, for the benefit of the settled estate. In 1882 the powers of the limited owner were still further increased. In that year was passed the Settled Land Act, 1882 (45 and 46 Vict. c. 38), since amended by 47 and 48 Vict. c. 19. For this very valuable Act the statute book is indebted to the late Earl Cairns. It does not repeal the Act of 1877, but gives cumulative powers. The Act of 1877 must still be brought into action in certain cases to which the Act of 1882 does not apply. The broad distinction between the two Acts is that the powers given by the Act of 1877 are based entirely, except in agricultural leases, on judicial proceedings, while those given by the Act of 1882 may be exercised by the tenant for life at his option, generally without the consent of trustees or the court. The powers are those usually inserted in settlements of real estate, and are conferred upon every tenant for life beneficially entitled to possession. This includes a tenant in tail by Act of Parliament restrained from defeating an estate tail, but not a tenant in tail where the land in respect of which he is restrained was purchased with money provided by parliament,⁴ a tenant in fee simple subject to an executory limitation, a person entitled to a base fee, a tenant for years determinable on a life, a tenant *pur autre vie*, a tenant in tail after possibility of issue extinct, a tenant by the curtesy, &c. A married woman may exercise the powers given by the Act in spite of any restraint on anticipation contained in the settlement. The Act does not apply to corporations, whether sole or aggregate. The chief powers given by the Act are those of selling and leasing. A tenant for life may sell settled land or any part of it, or any easement, right, or privilege over it, or the seignory of a manor, and may make exchange or partition. A sale must be for the best price, and an exchange or partition for the best consideration; the sale may be in one lot or several, and by auction or private contract. A reservation as to user or as to mines and minerals may be imposed. Settled land in England may not be exchanged for land out of England. A lease is not to exceed for building ninety-nine years, mining sixty, any other kind twenty-one. The regulations as to leases are in general correspondence with those of the Act of 1877. The time for which non-payment of rent gives a right of re-entry is thirty instead of twenty-eight days, and there are additional regulations as to building and mining leases. Where the tenant for life is impeachable for waste in respect of mines, three-fourths of the mining rent is to be set aside as capital money, in other cases one-fourth. The tenant for life may surrender and regrant leases. The principal mansion house and the demesnes thereof, and other lands usually occupied therewith, cannot be sold or leased without the consent of the trustees of the settlement or the order of the court. The Act provides for three kinds of sale:—(1) by the tenant for life *mero motu*, the ordinary case; (2) with consent of trustees or the court, as in the case of the principal mansion and of the application of money paid for a lease or reversion; (3) by order of the court, as in the case of the variation of a building or mining lease according to the circumstances of the district, of parliamentary opposition for the protection or recovery of settled land, and of the sale or purchase of chattels as heirlooms to devolve with land.⁵ Land acquired by purchase, exchange, or partition is to be settled as far as possible on the same trusts as the other settled property. Capital money is to be applied as the Act directs, generally for the benefit of the settled property. The tenant for life may enter into a contract for carrying into effect the purposes of the Act. A contract not to exercise the powers of the Act is void. As to procedure, an application to the Chancery Division is to be made by petition or summons. Jurisdiction is conferred upon county courts (in Ireland civil bill courts) in respect to land or personal chattels settled or to be settled, not exceeding in capital value £500 or in

¹ The law of Scotland was shortly afterwards altered by the Rutherford Act of 1848 (see ENTAIL).

² As by the Code Napoléon, § 896. By § 898 *substitutions vulgaires* are, however, practically allowed, the inconsistency with § 896 being avoided by affirming that these are not substitutions at all. In other countries the right of settlement or substitution has been much modified by legislation, mostly in the direction of limiting the authority of the settlor. Thus in Austria no family settlement (*Famillen-Fideicommiss*) can be created without the consent of the legislature, *Civil Code*, § 618.

³ In France the proprietor may only devise half, a third, or a quarter of his estate, according to the number of his children.

⁴ That is to say, the Act would apply to the estates tail of the marquiss of Abergavenny or the earl of Shrewsbury, but not to Blenheim or Strathfieldsaye, purchased with public money for the dukes of Marlborough and Wellington (see REAL ESTATE).

⁵ Land in this sense has quite recently been held to include an hereditary dignity, such as a baronetcy.

annual value £30. Rules of court have been framed for the purpose of carrying into effect the provisions of the Acts of 1877 and 1882. For more minute information than can be given in this place the Acts and rules themselves must be consulted.

The necessity for a settlement, as far as the wife's interests are concerned, has been diminished by the Married Women's Property Act, 1882 (45 and 46 Vict. c. 75). It is still, however, usual to have a settlement on marriage, especially where there is property of any considerable value. The Act contains a saving of existing settlements and a power to make future settlements with or without restriction against anticipation (not to be valid against a married woman's ante-nuptial debts). No settlement or agreement for a settlement is to have greater validity against a married woman's creditors than such settlement or agreement would have when made or entered into by a man. A future or reversionary interest in settled personality is specially excepted from the operation of Malins's Act (20 and 21 Vict. c. 5), under which a married woman may by deed acknowledged dispose of her future or reversionary interest in unsettled personality. The former law as to *equity to a settlement* seems to have been rendered obsolete by the Married Women's Property Act. The doctrine of equity formerly was in accordance with the maxim, "He who seeks equity must do equity,"—that, where a husband was forced to obtain the assistance of a court of equity to reach property to which he was entitled in right of his wife, equity would only aid him on condition of his settling a certain portion on his wife. Now that a husband cannot succeed to any property in right of his wife during her lifetime, the reason for the doctrine of equity to a settlement has disappeared.

As a rule a settlement can only be made by a person not under disability,—therefore apart from statute not by a lunatic, or a bankrupt, and generally not by an infant. But by the Infants' Settlement Act (18 and 19 Vict. c. 43) infant males of twenty or over or infant females of seventeen or over may with the approbation of the Chancery Division obtained by petition make a valid settlement or contract for a settlement of all or any part of their property. By the Acts of 1877 and 1882 the powers of the Acts may in certain cases be exercised by trustees of a settlement, trustees in bankruptcy, committees of lunatics, and guardians of infants.

Where the parties are not in a position to make an immediate settlement, articles for a settlement are sometimes entered into, but more rarely than formerly on account of the facilities offered by the Infants' Settlement Act. The court will enforce the execution of a settlement in accordance with the articles, and will reform one already made if not in accordance with them. The court will also enforce the specific performance of any contract on the faith of which a marriage has taken place, in spite of the provisions of § 4 of the Statute of Frauds (see FRAUD).¹ It should be noticed that marriage itself is not such a part performance of a contract as to give the court jurisdiction. An imperfect obligation arising from an informal ante-nuptial agreement can be made binding as between the parties by a post-nuptial settlement; but this will not protect such a settlement from being treated as a voluntary settlement against creditors.

A settlement or contract for settlement made in consideration of marriage or for other valuable consideration is as a rule irrevocable by the settlor and good against creditors. The only exception or apparent exception is the provision in the Bankruptcy Act, 1883 (46 and 47 Vict. c. 52, § 47 (2)), that any covenant or contract made in consideration of marriage for the future settlement on or for the settlor's wife or children of any money or property wherein he had not at the date of his marriage any estate or interest, and not being money or property or in right of his wife, shall, on his becoming bankrupt before the property or money shall have been actually transferred or paid, be void against the trustee in bankruptcy. With regard to voluntary settlements, 13 Eliz. c. 5 avoids as against creditors conveyances of lands or chattels contrived to delay, hinder, or defraud creditors or others, with a proviso protecting estates or interests conveyed on good consideration and *bona fide* to persons not having notice of fraud. 46 and 47 Vict. c. 52, § 47 (1), enacts that any settlement of property, not being a settlement made before and in consideration of marriage or made in favour of a purchaser or incumbrancer in good faith and for valuable consideration, or a settlement made on or for the wife or children of the settlor of property which has accrued to the settlor after marriage in right of his wife, shall, if the settlor becomes bankrupt within two years after the date of the settlement, be void against the trustee in the bankruptcy, and shall, if the settlor becomes bankrupt within ten years, be void against the trustee unless the parties claiming under the settlement can prove that the settlor was at the time of making the settlement able to pay all his debts without the aid of the settled property, and that

the interest of the settlor in such property had passed to the trustee of the settlement on the execution thereof. 27 Eliz. c. 4 was passed for the benefit of purchasers, as 13 Eliz. c. 5 was for that of creditors, but refers to real estate and chattels real only. It enacts that every conveyance of lands with intent to defraud purchasers shall be void as against such purchasers only, and that conveyances with power of revocation shall be void against subsequent purchasers. The Act has been construed to mean that a voluntary conveyance of real estate is void as against a subsequent purchaser, mortgagee, or lessee for value. With these exceptions a voluntary settlement is good as between the settlor and the objects of the settlement, and as between them and third persons. So far is this the case that the court will not assist a settlor to destroy the effect of a voluntary settlement by compelling specific performance against a subsequent purchaser. On the other hand the court will not enforce specific performance of a voluntary settlement, in spite of its being a contract under seal. Such an instrument, however, creates a debt and will be admitted to proof in a creditors' suit.²

Scotland.—A *disposition and settlement* is a mode of providing for the devolution of property after death, and so corresponds rather to the English will than the English settlement. The English marriage settlement is represented in Scotland by the *contract of marriage*, which, like the English settlement, may be ante- or post-nuptial. The main difference between the ante- and the post-nuptial contract is the extent to which the property the subject of the contract may be withdrawn from creditors. In the former case a preference or *jus crediti* is according to circumstances conferred on the wife or children; in the latter case the wife or children cannot compete with the creditors. A post-nuptial contract is also liable to revocation by the husband or wife. The Married Women's Property Act, 1881, while it makes the wife complete mistress of her property, at the same time does not exclude or abridge the power of settlement by ante-nuptial contract of marriage.

A contract of marriage may be made with or without the creation of trustees, the latter being the more usual form. If the contract settle heritable property, it generally contains a narrative or inductive clause, containing the names of the parties with an obligation to celebrate the marriage, a disposition of the estate with its destination, provisions as to the wife and younger children and a declaration that these provisions shall be in full of their legal claims, a conveyance by the wife of her whole means and estate to her husband or the trustees, an appointment of trustees to secure implement of provisions to the wife and children, a registration clause, and a testing clause. If the contract settle movables, it is, *mutatis mutandis*, in much the same form, with the addition of a clause excluding the *jus mariti* of a future husband of the wife (see *Juridical Styles*, vol. i. p. 174, vol. ii. p. 498). The Rutherford Act (11 and 12 Vict. c. 36) and the Entail Act, 1882 (45 and 46 Vict. c. 53), specially provide that settlements by marriage contract are not to be disappointed until the birth of a child, who by himself or his guardian consents to disentail, or until the marriage is dissolved, unless with the consent of the trustees of the contract. Improvements by limited owners were allowed by law much earlier than in England. 10 Geo. III. c. 51 enabled heirs of entail to charge the entailed estates with the sums of money laid out by them in building mansions. This principle was expressly adopted for England, as the preamble of the Act shows, by the Limited Owners' Residence Act, 1870. The Rutherford Act and other Acts empowered heirs of entail to excamb, to feu, to lease, to charge by bond and disposition in security, to sell, to grant family provisions, and to erect labourers' cottages. The Settled Estates Act and Settled Land Act do not apply to Scotland. Substitution, as in Roman law, can only be made by testamentary or *mortis causa* disposition. The Rutherford Act and the Entail Amendment Act, 1868 (31 and 32 Vict. c. 84), more strict than the law of England against perpetuities, forbid the creation of a life-rent interest in heritables or movables except in favour of a party in life at the date of the deed creating such interest.

United States.—Marriage settlements are not in as common use as in England, no doubt owing to the fact that the principle of the Married Women's Property Act was the law of most of the States of the Union long before its adoption by England. In Louisiana, in the absence of stipulation to the contrary, community of goods is the rule. Settlements other than marriage settlements are practically unknown in the United States. Property cannot, as a general rule, be tied up to anything like the extent still admissible in England. In those States where entail is allowed the entail may be barred by simple means of alienation. (J. Wt.)

SETTLEMENT, ACT OF. By this Act, 12 & 13 Will. III. c. 2, passed in 1701 (followed by the parliament of Scotland in the Act of Union, 1707, c. 7), the crown was
